Contents — Volume 4

1. Untitled — W. Scott Tebb [2022]
2. Dishes made without meat — Mrs. C. S. Peel [2022]
3. An embroidery book — Anne Knox Arthur [2023]
4. Practical vegetarian cookery — Unknown [2023]
5. Cheese and its economical uses in the diet — C. F. Langworthy [2023]
6. Accounting theory and practice, Volume 1 (of 3) — Roy B. Kester [2023]
7. Accounting theory and practice, Volume 2 (of 3) — Roy B. Kester [2023]
8. Psyche's task — James George Frazer [2023]
9. Untitled — Unknown [2023]
10. Untitled — Eliza Acton [2023]
11. The book of hats and caps — M. Elliott [2023]
12. Family fare — Unknown [2024]
13. The virtues of common water — John Smith [2024]
14. Untitled — Unknown [2024]
15. Untitled — George M. Rolph [2024]
16. Untitled — Unknown [2024]
17. Italian and Tyrolese violin makers. — Jon Masters <jcm@perihelion. (none) > [2024]
18. Handbook on dress and cloak cutting — Charles Hecklinger [2024]
19. The botanist's repository for new and rare plants; vol. 09 [of 10] — active 1799-1828 Henry Cranke Andrews [2024]
20. The wonders of the world — John Loraine Abbott [2025]
21. X-ray, violet ray, and other rays — Maynard Shipley [2025]
22. Untitled — British Medical Association [2025]
23. Untitled — Lou Andreas-Salomé [2025]
24. Spectacle secrets — George Cox [2025]
25. Shell shock and its lessons — Grafton Elliot Smith [2025]
26. Some old masters of Greek architecture — Harry Douglas [2025]
27. Untitled — Unknown [2025]
28. The magic lantern and its management — comte Th. Du Moncel [2025]
29. The practice of osteopathy — Carl Philip McConnell [2025]
30. Baths and bathing — Various [2025]

TEA

AND THE

EFFECTS OF TEA DRINKING.

BY

W. SCOTT TEBB, M.A., M.D., CANTAB., D.P.H.

FELLOW OF THE INSTITUTE OF CHEMISTRY, PUBLIC ANALYST TO THE

METROPOLITAN BOROUGH OF SOUTHWARK.

London: T. CORNELL & SONS, Commercial, Law and General Printers, 63, Borough Road, S.E.

In March, 1904, the Southwark Borough Council at the request of Sir William Collins gave permission for an inquiry to be made into the constituents of tea in order to ascertain what injurious ingredients were present, and if it were possible to obtain the characteristic effects without subjecting tea-drinkers to any of the deleterious symptoms. The subject will be seen to be of importance and I propose to include a brief history of the use of the Tea plant, together with a general review of the experience gained by those best competent to judge of the effects since its introduction of what has now come to be considered a necessity of life. In addition there are set forth the results of examination of different samples of tea and the general conclusions to which I have arrived.

What we call tea, is called by the Chinese tcha, tha, or te, and by the Russians tchai. The original English word was tee, at least this is the name used by Samuel Pepys one of the earliest to allude to the herb in this country. Tee was afterwards altered to tay, as will be seen from Pope’s lines in the “Rape of the Lock.”

Soft yielding minds to water glide away And sip, with nymphs, their elemental tay.

Or again,

Hear thou, great Anna! whom three realms obey Dost sometimes counsel take, and sometimes tay.

Some of the modern editions of Pope have altered the spelling at the expense of the rhyme.

The tea-plant, Thea Sinensis, botanically speaking a close ally of the Camellia is in its natural state a tree which attains to 20 or 30 feet in height. Under cultivation it remains a shrub from three to six feet high. It grows in all tropical and sub-tropical countries, and roughly it takes the labour of one man a day to produce a pound of tea. The leaves--the only part of the plant used in commerce--vary from two to six inches long, are evergreen, lanceolate and serrated throughout nearly the whole margin; the leaves are stalked and arranged alternately on axis, the flowers somewhat resemble apple blossoms but are smaller.

The shrubs are planted in rows three or four feet apart and look like a field of currant or gooseberry bushes; at the end of the third year the bushes become large enough to allow of the first picking and in the eighth year the plant is cut down, when new shoots spring up from the old roots. In Ceylon and parts of India the first picking is in March and there may be as many as 25 pickings in the season until October; in China the first picking is in April, and in Japan late in April or early May. The early pickings make the finest quality of tea, and the very late leaves are not usually exported at all, but are used by the peasants locally. In preparation for commerce the leaves are subjected to various processes of drying, rolling and roasting, into which it would not be necessary at any length to enter; the essential point to remember is that black tea differs from green in that after a short preliminary rolling and roasting, the leaves are exposed to the air in a soft moist state, when they undergo fermentation with the result it is said that a portion of the tannic acid is converted to sugar. Robert Fortune,[1] an authority on the cultivation of the tea plant thought that the

differences of manufacture “fully account for the difference in colour, as well as for the effect produced on some constitutions by green tea, such as nervous irritability, sleeplessness, &c.”

When we come to look into the early origin of the practice of tea-drinking we find that the subject is shrouded in the mists of antiquity. There are many legendary stories of the discovery and use of tea by the Chinese, but the only authentic and well-attested accounts were given by two Mahommedans who travelled in India and China in the ninth century. The original manuscript was found in the Comte de Seignelay’s library by Eusebius Renaudot and published in 1733. There is plain internal evidence that the manuscript was written about 1173, for there are observations upon the extent and circumference of the walls and towers of Damascus and other cities in subjection to the Sultan Nuroddin, who is spoken of as living at that time. This prince died in 1173 which fixes the date of the narrative before that time. The account speaks of the Arab merchants having been present in China in the years 851 and 867 respectively. On page 25 occurs the following important passage “The Emperor also reserves to himself the revenues which arise from the salt mines and from a certain Herb which they drink with hot water, and of which great quantities are sold in all the cities, to the amount of great sums. They call it _sah_ and it is a shrub more bushy than the pomegranate tree and of a more taking smell, but it has a kind of bitterness with it. Their way is to boil water, which they pour upon this leaf, and this drink cures all sorts of diseases; whatever sums are lodged in the treasury arise from the Poll-tax, and the duties upon salt, and upon this leaf.”[2]

Tea was therefore much in vogue in China in the 9th century. From China the knowledge was carried to Japan, and there the cultivation was established at the beginning of the 13th century; from that time until the 19th century China and Japan have been the only two tea producing countries. As with all innovations Europe and particularly England was very slow to take to the practice, for tea is hardly mentioned by any of the writers prior to the 16th century.

One of the earliest to allude to the subject was Giovanni Botero[3] in 1596, in his treatise on the causes of the magnificence and greatness of cities; he remarks that “they (the Chinese) have also an herb, out of which they press a delicate juice, which serves them for drink instead of wine, it also preserves their health and frees them from all those ills that the immoderate use of wine doth breed unto us.”

It will be observed that in these early accounts much stress is laid on the beneficial action of tea in preserving health and curing disease, and this was in all probability the first use to which the shrub was applied. Thus one of the Sloane Manuscripts, dated 1686, gives a long list of “qualities and operations,” attributed by the Chinese to the tea plant. It was said to purify the blood and kidneys, cure giddiness and pains in the head, vanquish superfluous sleep and heavy dreams, open obstructions, clear the sight, strengthen the memory, sharpen the wits and quicken the understanding.

About the year 1657, Thomas Garway of the Exchange Alley issued a sheet proclaiming the virtues of tea; the alleged qualities being almost identical with those given in the Sloane Manuscript just mentioned. This was a sort of advertisement of his place of business and he tells us that “many noblemen, physitians, merchants, and gentlemen of quality” sent to town for the “said leaf,” and “daily resort” to his house in Exchange Alley to drink tea. He informs us that prior to 1657 it was only used as a “regalia in high treatments and entertainments,” and for presents for princes and grandees.

Another early reference is from an advertisement in the “Mercurius Politicus” for 1658. “That excellent, and by all physitians approved _China_ drink, called by the _Chineans_, Tcha, by other nations _Tay alias Tee_ is sold at the _Sultaness-head_, a _Cophee-house_ in _Sweetings_ Rents, by the Royal Exchange, London.”[4]

A further early reference is by Thomas Rugge[5] which may be seen in a manuscript at the British Museum. “About this time the parliment that was forced out the 13th day of October, 59; it was called by all sorts of persons the Rump, because they war soe few in number; and there war also att this time a Turkish drink to be sould, almost in every street called Coffee, and another kind of drink called Tee, and also a drink called Chocolate which was a very harty drink.”

It is rather difficult to reconcile this account of the prevalence of the use of tea as a drink with that of other writers of the period. Thus Pepys writing a year afterwards under date September 25, 1660, says: “I did send for a cup of tee (a China drink) of which I never had drank before.” This clearly points to the novelty of the practice in 1660 for Samuel Pepys was Secretary of the Admiralty, and a public man of keen observation, and it is almost impossible if tea was commonly sold as a drink at this time that he should have been unaware of the fact. Macaulay[6] also mentions that about this time tea “had been handed round to be stared at.” It seems therefore clear that the herb was quite recently introduced in 1660, and it is possible that Rugge under the name of “tee” is referring to hot infusions of other leaves for it is well known that herbs were commonly used for making different sorts of teas as

sage tea, &c.[7]

The first official notice of tea is in the Act of Parliament (12 Carolus II., c 23), by which a duty of eightpence was charged on every gallon of coffee, chocolate, sherbet, and tea made for sale. In 1662 Charles II. married Princess Catherine of Portugal, and the Poet Waller has immortalised tea-drinking by a birthday ode in her honour.

The muse's friend, tea, does our fancy aid, Repress those vapours which the head invade, And keeps that palace of the soul serene Fit, on her birthday, to salute the Queen.

Two years later the King was a recipient of the then valuable gift of 2lb. 2oz. of tea from the East India Company.

In Pepys Diary under the date of June 28, 1667, we read "Home and there find my wife making of tea; a drink which Mr. Pelling, the Potticary, tells her is good for her cold and defluxions." Tea, therefore, was just coming into vogue. In 1669 the East India Company received two canisters containing 143½■ pounds; the price at this time was sixty shillings a pound. The Company imported 4713 pounds in 1678, but this amount probably glutted the market, for in the six subsequent years the imports were quite inconsiderable. In 1697-99 the imports averaged 20,000, in 1700-08 they reached 80,000 pounds, in 1728 over a million pounds, in 1754 four and a half million, in 1763 six million, and in 1779 nearly ten million pounds.[8] It is not necessary to follow the imports during the whole of the 18th century, speaking generally it was found that excessive duties led to smaller imports, and at the same time to a large increase of smuggling and other irregularities.

Since 1800 there has been an enormous increase of consumption in the United Kingdom, as will be seen from the following figures:--

TABLE A.

Average number of Average Average number of Year-Periods. pounds of Tea annual pounds of Tea consumed consumed per annum. Population. per head per annum. 1801-10 23,717,882 16,794,000 1·41 1811-20 24,753,808 19,316,700 1·28 1821-30 28,612,702 22,433,900 1·27 1831-40 34,441,766 25,257,200 1·36 1841-50 44,286,600 27,566,300 1·61 1851-60 65,160,456 28,172,400 2·31 1861-70 97,775,548 30,027,600 3·26 1871-80 144,462,622 33,055,020 4·37 1881-90 178,130,836 36,178,144 4·92 1891-1900 224,076,800 39,440,316 5·70 1901-03 255,270,472 41,550,773 6·10

Since the beginning of the last century therefore the average consumption per head has increased from 1·4 to 6·1 pounds. In our Australian and New Zealand Colonies the quantity consumed is even much larger than in the United Kingdom as will be seen from the table below:--

TABLE B.

Average number of pounds of Tea consumed per head per annum. New South Wales 8·01 Victoria 7·38 South Australia (except N. Territory) 8·87 South Australia (North Territory) 6·44 Western Australia 10·07 Queensland 7·09 Tasmania 6·62 All Australia 7·81 New Zealand 6·78

The enormous quantity of tea consumed in Great Britain and our Colonies will be better appreciated if comparisons are made with other Countries:--

TABLE C.

Average number of pounds of Tea consumed per head per annum. Russia 0·93 Germany 0·12 Holland 1·48 France 0·06 United States 1·09 Canada 4·64

I should like to say a few words concerning the sources of tea supply to the United Kingdom. Of course until fairly recent times practically all the tea came from China. Early in the last century it was found that the tea plant was indigenous to India. In 1825 the Society of Arts offered their gold medal "to the person who shall grow and prepare the greatest quantity of China tea, of good quality, not being less than 20 pounds weight"[9] in the East Indies and British Colonies. In 1832 Dr. Wallick made a report on the cultivation of tea in India and said "that under a well-directed management the tea plant may at no distant period be made an object of extensive cultivation in the Honourable East India Company's Dominions." Several years afterwards in 1839 the Society of Arts Medal was awarded to Mr. C. A. Bruce "for discovering the indigenous tea tracts and successfully cultivating and preparing tea in the British possessions in India." In 1840 the first Indian Tea Company was formed, in 1853 tea was growing in Cachar, in 1856 in

Sylhet, and in 1864 in Darjeeling and other places. Much more recently Ceylon has become prominent in supplying this country with tea. It came about in this way; the coffee plantations were destroyed by disease in 1868 and the planters succeeded in growing cinchona and tea as alternative crops. This experimental growth of tea in Ceylon has now become a flourishing industry.

The following table shows in five year periods since 1866, the proportion of each 100 pounds of tea imported into the United Kingdom from India, Ceylon, China and other countries respectively:

TABLE D.

Five Year Other Periods. India. Ceylon. China. Countries. 1866-70 6·62 0·00 91·44 1·94 1871-75 10·50 0·08 85·62 3·80 1876-80 18·26 0·06 80·18 1·50 1881-85 26·73 0·86 70·71 1·71 1886-90 39·66 10·96 47·07 2·32 1891-95 47·10 29·30 21·04 2·56 1896-1900 50·25 36·30 10·52 2·93 1901-03 58·45 33·28 4·74 3·53

It appears that China which formerly supplied 90 per cent. in 1866, now contributes less than 5 per cent. of our tea. During the same period the Indian supply has gone up from 6 to 58 per cent., and Ceylon which only commenced to send tea in 1875 now sends the substantial proportion of 33 per cent. of the total importation.

From the above tables it will be seen that of the yearly average of six pounds consumed in the United Kingdom, one third of a pound comes from China, three and a half pounds from India, and two pounds from Ceylon. The Dutch the next largest tea-drinkers to the British consume a pound and a half each person per annum, half of this comes from Java and the remaining half from the United Kingdom (principally of Chinese origin). Most of the tea drunk in Russia comes from China. In Australia two-thirds of the tea is imported from India and Ceylon, and the rest comes from China. In the United States more than half the tea comes from China and the bulk of the remainder from Japan.

I now proceed to deal briefly with the constituents of tea which are generally believed to impart to the tea infusion its special characters.

Alkaloid. The alkaloid which is present in tea to the extent of 3 or 4 per cent. is thought to be identical with that found in Coffee, viz: caffeine. It has the well-known stimulant and invigorating qualities with which the taking of tea is associated. Thus the brain is stimulated, the intellect becomes clear; there is removal of languor and fatigue with increased wakefulness and alertness. The following is by a Chinese writer, who lived over 1,000 years ago and he writes so well, and so much to the point, that we must not quarrel with him if he has omitted to give us the reverse aspect of the question.

It tempers the spirits, and harmonises the mind, Dispels lassitude, and relieves fatigue, Awakens thought, and prevents drowsiness, Lightens or refreshes the body, and clears the perceptive faculties.

We shall also forgive Cowper’s strong prepossession in favour of tea when we call to mind the cosy, comfortable picture which he describes:

And while the bubbling and loud hissing urn, Throws up a steamy column, and the cups That cheer but not inebriate, wait on each So let us welcome peaceful evening in.

I suppose that this verse has been as much quoted as anything in our language, and the homely picture of the evening meal has done much to wean the English people from stronger drinks.

The following article from the _Lancet_ of 1863 presents all the arguments, and very important arguments they are and very well stated which can be placed to the credit of tea-drinking:--

“It has a strange influence over mood--a strange power of changing the look of things, and changing it for the better: so that we can believe and hope, and do under the influence of tea, what we should otherwise give up in discouragement and despair,--feelings under the influence of which tissues wear rapidly. In the language of the poor, who in London we are told spend one-eight of their income in buying tea, it produces a feeling of comfort. Neither the philosopher nor the philanthropist will despise this property of tea, this power of conferring comfort, or removing _ennui_, of promoting those happier feelings of our nature under which we can do most and bear most. There is no denying the considerable dependence of our moods and frames upon substances; and as moods are as important as muscles, as they affect as largely a man’s ability for the great ends of life, we cannot regard the cheapening of such substances, when devoid of noxious qualities, as other than a most important benefit to the poor.”

This feeling of comfort, this power of changing the aspect of affairs, of appealing to the happier side of our nature, in other words of putting us at our best, is undoubtedly due to the alkaloid of tea. Since I have been interested in the subject I have conversed with a number of friends, and many have told me that the best time of day to do any writing or intellectual work is after a cup of tea in the afternoon, and I must confess to feeling more myself at this time than at any other; but, on the other hand if no afternoon tea is taken, this period of the day is when most people feel fagged and tired and incapable of mental exertion. This shews the great influence exercised by tea over our moods and feelings; and if tea is taken in moderation this property may be of great help and a mental stimulus to us in our daily vocation.

Tannin.--The other important constituent of tea, viz.: tannin is present to the extent of 10 or 20 per cent. and it is this substance to which most of the injurious effects of tea have been attributed. In excess tannin tends to depress the action of the digestive fluids and ferments. It interferes with the normal activity of secretion by constricting the blood vessels and diminishing the circulation, and lastly it tends to combine with the nitrogenous principles of the food rendering them insoluble and incapable of digestion. The tendency therefore of this substance is greatly to impair digestion and it gives rise to palpitation of the heart, headache, flatulence, loss of appetite, constipation and other symptoms so well-known at the out-patient departments of our general hospitals; on inquiry it is often found that the patient is accustomed to drink large quantities of tea, which has stood for long periods and consequently extracted excessive amounts of tannin.

In addition to the alkaloid and tannin the older writers asserted that tea contained a volatile oil to the extent of 0·6 to 1 per cent., and many of the qualities and deleterious effects of tea have been traced to the presence of this substance. The latest experiments, however throw some doubts on these early results. Thus in the report of Schimmel & Co. for April, 1897, it is stated (p. 39) that “in former years we endeavoured on several occasions to distil various kinds of tea in order to introduce tea oil ... we have, however, in no case succeeded in obtaining more than mere traces of oil,” and they conclude that in the hands of the early experimenters the oil found on distillation was due to the artificial flavouring of tea which was common at that time. Schimmel & Co. in their Report for April, 1898 (p. 50) refer to a report of the Botanical Gardens in Buitenzorg for 1896. It appears that experiments were made on a large scale, thus 2500 kilograms of freshly fermented tea leaves were submitted to steam distillation and 130 cubic centimetres or 0·0052 per cent. of oil was obtained.[10] It must be remembered that this oil was only found in freshly fermented leaves and from the minute quantity I think we may conclude that tea oil if present has little or no connection with the qualities and attributes of tea, or the deleterious effects to which it may give rise.

A word or two with reference to the adulteration of tea. In former times a good many samples and especially of green tea were faced; this consisted in the addition of some colouring matter as Prussian blue, turmeric, or indigo; and sometimes black tea was faced with graphite. Another practice formerly prevalent was the addition of various leaves having a resemblance to tea leaves; and then there was the use of exhausted or spent leaves. All these forms of adulteration are now happily very seldom practiced. To shew the extreme rarity of tea adulteration in this country, in the 17 years from 1887 to 1903, 7595 samples were purchased under the Food and Drugs Acts and of these only 23 were found to be adulterated. These figures include 15 cases in 1898, and according to the report of the Local Government Board for this year many were of the description known as caper tea. This is one of the China varieties and consists of small granular masses made up by the aid of gum and starch, and this lends itself to the addition of sand and stones as actually happened in the cases in question. I think that with this exception of mineral matter, tea adulteration in this country may now be said to be practically non-existant.

We have glanced through the general effects of the important constituents of tea. I now propose to consider the amount of harm which can be justly attributed to this popular article of daily consumption.

The opposition to tea on the ground of injury to health is almost as old as the introduction of tea itself. One of the earliest objectors was Dr. Simon Pauli,[11] the Physician to the King of Denmark, in a commentary he wrote on the abuse of tobacco and tea. He objected on the ground that “tea is moderately heating, bitter, drying and astringent.” He felt it incumbent on him to warn Europeans against the abuse of tea, especially as the herb he said by no means answered the encomiums bestowed upon it by the Chinese and Japanese. “I wish all persons especially such as are old would obstinately reject _tea_, which so dries the bodies of the _Chinese_ that they can hardly spit.” Pauli was also a strong opponent of Coffee and alleged that it produced “sterility.”

Another powerful writer on the subject was Dr. Cohausen a learned and ingenious German physician. The works of this author were numerous and bore evidence of the vigour of his intellect and of his application to letters. His work entitled “Neothea,” and published in 1716, was written to shew the folly of sending to China for tea, when we had so many herbs to hand, just as pleasant and far more healthy. His wit for which he was justly celebrated was not sufficiently powerful to render the use of tea unfashionable.

Boerhaave, the great Dutch physician, and follower of Hippocrates and Sydenham had an objection to tea, but not so much to the herb itself as to the practice of drinking of hot liquids. He refers to those persons who “weaken their bodies with perpetual drinking of aqueous liquors; such is the very bad custom which prevails amongst the Dutch, who indulge themselves in a sedentary life, and all day long use those Asiatic drinks made of the berries of coffee or leaves of tea.”[12] He also attributed to these drinks certain nervous disorders. “I have seen a great many, so enervated by drinking too freely of those liquors (tea, coffee and the like) that they could hardly move their limbs, and likewise several who were seized with the apoplexy and palsy from that cause.”[13]

An early lay opponent of tea-drinking was John Wesley. He tells us that when he first went to Oxford with an exceedingly good constitution “he was somewhat surprised at certain symptoms of a paralytic disorder.” His hand shook especially after breakfast, and he observed that if he gave up tea-drinking for two or three days, the shaking ceased. On inquiry he found that tea had the same effect on others, and particularly on persons whose nerves were weak. This led him to lessen the quantity and to drink weaker tea, but still for about 26 years he was more or less subject to the same disorder. In 1746 he began to observe that a number of people in London were similarly affected, some suffering from the nerves with decay of bodily strength, and he asked them if they were hard drinkers, and learnt in reply that they drank nothing but a little tea, morning and evening. He came to the conclusion that they suffered from the effects of tea like he had himself. Wesley thought he should set an example and broke himself of a practice which had lasted for 27 years. The first three days he suffered from headache more or less all day long, and was half asleep from morning to night; on the third day his memory failed but the symptoms abated in the following day and his memory returned. He felt great benefit from the abstinence, and found that his hand was as steady at 45 as it had been at fifteen.

One of the most determined opponents of tea-drinking in the 18th century was Jonas Hanway, the eminent philanthropist and “father” of Sunday schools. His views may be gathered from the title of his work.[14] Owing to the results of this beverage he said “men seem to have lost their stature and comeliness; and women their beauty ... what Shakespeare ascribes to the concealment of love, is _in this age_, more frequently occasioned by the use of _tea_.... I am persuaded the inhabitants of this island will never increase in number nor enjoy a blooming health whilst they continue such an extravagant use of tea.” Hanway’s exaggerations succeeded in drawing Dr. Johnson into the controversy. The great man in a review of Hanway’s work said “he is to expect little justice from the author of this extract, a hardened and shameless tea-drinker who has for twenty years diluted his meals with only the infusion of this facinating plant, whose kettle has scarcely time to cool, who with tea amuses the evening, with tea solaces the midnights, and with tea welcomes the morning.”[15]

We learn from Boswell that “no person ever enjoyed with more relish the infusion of that fragrant leaf than Johnson. The quantities which he drank of it at all hours were so great, that his nerves must have been uncommonly strong, not to have been extremely relaxed by such an intemperate use of it.” Boswell says that Johnson assured him he never felt the least inconvenience from it. In a footnote to page 105 of Boswell’s “Life” we are informed that a Mr. Parker of Henley was in possession of a tea-pot which belonged to Dr. Johnson and held “above two quarts.”

At the end of the eighteenth century Dr. Lettsom, a well-known authority on the subject, published a work on the “Natural History of the Tea Tree.” He found that amongst the less hardy and robust complaints were ascribed to the drinking of tea “there are many who cannot bear to drink a single dish of tea without being immediately sick and disordered at the stomach, ... and that in irritable constitutions it speedily excited the nerves to such a degree as to give rise to uneasy sensations and bring on spasmodic affections.” He also says “I know people of both sexes, who are constantly seized with great uneasiness, anxiety, and oppression as often as they take a single cup of tea.” For children he thought it decidedly harmful; “children and very young persons in general, should as much as possible be deterred from the use of this infusion. It weakens their stomach, impairs the digestive powers and favours the generation of many diseases.” On the whole however, he was not altogether opposed to the practice in strong healthy vigorous adults, “to such it is undoubtedly wholesome and equal at least if not preferable to any other kind of regale now in use.” On another page we read that “if not drunk too hot, nor in too great quantities it is perhaps preferable to any other vegetable infusion we know.”

Quite at the end of the eighteenth century, Dr. Buchan, who was something of a medical reformer, and had naturally observed the results of tea-drinking thought that the ill-effects proceeded rather from the imprudent use of it than from any bad qualities in the tea itself. In his “Domestic Medicine” (p. 74) he says, “good tea, taken in moderate quantity, not too strong, nor too hot, nor drank upon an empty stomach, will seldom do harm, but if it be bad, which is often the case or substituted in the room of solid food, it must have many ill effects.” He observed that “females who live much on tea and other watery diet, generally become weak, and unable to digest solid food; hence proceed hysterics, and all their dreadful consequences.”

In the early part of the nineteenth century we have the opinion of William Cobbett, a vigorous writer and acute observer of the habits of the time in which he lived. In his “Advice to young men” Cobbett remarks “Let me beseech you to resolve to free yourselves from the slavery of the _tea_ and _coffee_ and other _slop kettle_, if unhappily you have been bred up in such slavery. Experience has taught me that those slops are _injurious to health_. Until I left them off (having taken to them at the age of 26) even my habits of sobriety, moderate eating, early rising, even these were not, until I left off the slops, sufficient to give me that complete health which I have since had.”

The most complete but painful description I have come across of the distressing symptoms occasionally associated with tea-drinking is given by Dr. James Henry[16] who writes in 1830. He refers to the case of a gentleman who commenced the use of tea of ordinary strength at the age of 14. Shortly afterwards sleep became less sound, and he became nervous and easily agitated about matters of small consequence. Afterwards he suffered from uneasiness even while sleeping, also from nightmare and palpitation of the heart. His sleep was disturbed during the whole period of ten years; during this time he took three cups of tea in the morning and three cups in the evening. At the age of 24 or 25 he used tea more freely and his sleep became more and more disturbed. He sometimes took tea twice in the same evening. The suffering was very great; he did not fall asleep at night until two o’clock and the agitation of mind and body was indescribable. The pulsations of the heart were sometimes quick and faint, and sometimes so violent that he could not lie on his left side. Sometimes the pulsations became scarcely perceptible for several moments, at such times the patient felt as if he were dying and if he fell asleep he awoke with a violent start. He wished to sleep that he might avoid the distressing sensations which he felt while awake, but feared to do so lest his awakening should be accompanied by frightful agony. After a time the distressing sensations were so marked especially just before going to bed that “in the society of my family I felt myself so agitated without any apparent cause that I was unable either to speak or think deliberately, or even to remain in one position and have been obliged that I might not be thought insane to rise abruptly, hurry out of the house and take violent exercise in the open air.” At 30 years of age he renounced tea and never suffered afterwards, “the very first night I slept soundly and I have never had any return either of sleeplessness or of starting or of the sensation of imminent death, unless on the rare occasions when I have returned to the use of tea.” Dr. Henry argued from the above case that “tea and coffee act as a poison upon some persons” and on turning his attention to the subject he found that such cases were far from uncommon, and concluded that like alcohol tea may be indulged in for a series of years without apparent ill consequences, but that sooner or later it undermines the health, and renders life miserable. As with alcohol he recognises two stages. The first stage was characterised by agreeable sensations in the stomach, moderate perspiration, quickened pulse and increased vivacity of mind and body. In the second stage there was irregular pulse, sometimes rapid, sometimes slow and intermitting, with palpitation and pains in the region of the heart--a vivacity of thought and action which is quite uncontrollable by the will, a painful insensibility to impressions of all kinds, twitchings of the muscles, disturbed sleep, frightful startings especially in the evening, irregular and sometimes cold perspiration, impaired appetite and defective circulation in the extremities. He concluded “that the immoderate use of tea and coffee produce a disease which bears a close resemblance to the _delirium tremens_ of whisky drinkers, and which is almost identical with the diseased state induced by the excessive indulgence of opium.”

We now come to the opinion of the more recent authorities and a few remarks are necessary concerning the symptoms liable to result from excessive tea-drinking. In the _Boston Medical and Surgical Journal_ for September 10th, 1868, a writer Dr. Pratt explains the effects on himself of 12 grains of the alkaloid of tea. After two hours there was great physical restlessness, a very uneasy state of mind which has been described by Lehmann as “mental anguish.” Soon after there was marked tremulousness of the hands and arms; the hand trembled so violently that it was impossible to write with any regularity. The mind was excessively uncomfortable and anxious which admitted not of the slightest rest; it was in a state of most active and persistent thinking in spite of all attempts at forgetfulness. The severe symptoms lasted about two hours. Dr. Pratt spoke to one of the most prominent New England lady writers. She had tried green tea when pressed to do a large amount of writing in a short time. Some time after taking a large quantity of tea she felt as “if there was nothing left but her head which furnished rapidly language or ideas of the best quality, and in goodly quantity all night long.” The next day there was headache and more or less prostration.

An important article on the “toxic effects of tea” was contributed by Dr. Morton[17] in 1879. He said that the bad effects of tea tasting were known and recognised by the tea tasters themselves and that few could carry on the business for many years without breaking down. The immediate effects of moderate doses were increased rapidity of pulse, increased respiration, agreeable exhilaration of mind and body, a feeling of contentment and placidity, and an increase of intellectual and physical vigour with no noticeable reaction. The immediate effects of an excessive dose, were a rapid elevation of the pulse and marked increase of respiration; there was no period of exhilaration, but immediate and severe headache, dimness of vision, ringing in the ears, and dulness and confusion of ideas. Following this a severe reaction with exhaustion of mind and body, tremulousness, nervousness

and dread of impending harm. The effects of continued doses were--continuance of tremulousness, extreme susceptibility to outside impressions, constipation and diminution of urine.

Dr. Morton concluded that tea--like other potent drugs--had its proper and improper uses, in moderation it was a mild and pleasant stimulant followed by no harmful reaction but that continued and immoderate use led to serious symptoms including headache, giddiness, ringing in the ears, tremulousness, nervousness, exhaustion of mind and body, disinclination to mental and physical exertion, increased and irregular action of the heart and also dyspepsia.

Dr. Bullard[18] of Boston made inquiry into the subject of poisoning from excessive tea drinking and found that the prominent symptoms were loss of appetite, dyspepsia, palpitation of the heart, headache, nervousness and various forms of functional nervous symptoms of an hysterical or neuralgic character; he found that usually speaking five cups of tea a day on an average were required to produce symptoms of tea poisoning.

A more recent investigator Dr. Wood[19] found in his practice at the Brooklyn Central Dispensary that of 1000 consecutive cases applying for general treatment, 100 or 10 per cent. were found to be “liberal indulgers in tea,” and suffering from its deleterious effects; of those 100 patients:--

45 complained of headache. 20 ” persistent giddiness. 20 ” despondency. 19 ” indigestion. 19 ” palpitation of the heart. 15 ” sleeplessness.

Dr. Wood found that when tea had been used for a considerable period in excess, the symptoms were giddiness, mental confusion, palpitation of the heart, restlessness, sleeplessness, hallucinations, nightmare, nausea, neuralgia, with prostration and anxiety. In three of Dr. Wood’s cases there was a tendency to suicide.

Mr. Jonathan Hutchinson, a great authority thinks that it is only the abuse of tea which is attended with serious consequences. “For my own part I have not the least hesitation in recording the conviction that the development of the tea trade has been in the past and will be in the future a most important aid to the progress of civilisation. Nor do I believe that it will be attended by any serious drawbracks.”[20] But he sounds a note of caution when he says “there can be no doubt whatever that the injudicious use of tea may produce not only alarming attacks of disturbance of the heart, but seriously impair the digestion, and enfeeble the nervous system.”

Sir Andrew Clark, who gave much consideration to the subject, in a lecture delivered at the London Hospital said, “I may remark incidentally that it has always been a matter of surprise to me how it is that we English people do not suffer more than we do from our indulgence in tea, especially tea prepared as it usually is, and taken after a prolonged fast early in the morning. It is a great and powerful disturber of the nervous system, and no one who has any regard for his or her nervous system would take it in that way. Its immediate effect may be all that can be desired. It relieves the _malaise_ which is in itself a sign of warning, and it thus enables the consumer to disregard it. Beware gentlemen, of thus sitting on a safety-valve. Nature provides a warning in most cases of impending disaster, and if you wilfully disregard or stifle them, you do so at your peril. This pernicious habit of taking strong tea after a night’s fast, repeated day after day, week after week, year after year, leaves its stamp on the nervous organism of the individual, and this stamp is handed down, in part at any rate, to the generation that follows.”[21]

Sir Lauder Brunton[22] who has also given much study to the question made some remarks in his Lettsomian Lectures on the “Disorders of Digestion.” He said that tea was very apt to cause a feeling of acidity and flatulence. Sometimes the acidity comes on so soon after the tea taken that it is difficult to assign any other cause for it than an alteration in sensibility of the mucous membrane of the stomach or œsophagus. The effect of tannin he said was to interfere very considerably with the digestion of fresh meat, and there were many people in whom tea taken along with fresh meat will upset the digestion. It did not interfere with the digestion of dried meat such as ham or tongue, the fibres of these have already become shrunk or toughened in the process of curing. He thought that tea at breakfast was not so apt to cause indigestion, but that tea in the afternoon two or three hours after lunch would sometimes bring on acidity almost immediately. A part of the mischief wrought by tea in the lower classes was due to allowing it to infuse for a long time so that a large quantity of tannin was extracted. Another reason was that the poor were accustomed to drink tea very hot. Heat was a powerful stimulant of the heart, and a cup of hot tea was therefore much more stimulating and refreshing than a cold one. The practice, however, of sipping the tea almost boiling was apt to bring on a condition of gastric catarrh. Sir B. W. Richardson was probably more opposed to the practice of tea-drinking than any of our leading modern physicians and as one of the most distinguished medical reformers of recent times his opinion is entitled to carry much weight.

“The common beverage tea,” he says, “is often a cause of serious derangement of health, if not of actual disease. The symptoms of disturbance occur when even the best kind of tea is taken in excess, and almost inevitably from the mixture called ‘green tea’ when that is taken even in moderate quantity.... Tea first quickens, and then reduces the circulation which is the action of a stimulant. But tea does more than this; it contains tannin, and is therefore styptic or astringent in its action from which circumstance it is apt in many persons to produce constipation, and interfere with the function of the liver. In some persons this astringent effect of tea is very bad. It gives rise to a continued indigestion, and what is called biliousness. The most important agent in tea, however, is the organic alkaloid, theine. The alkaloid exercises a special influence on the nervous system, which, when carried to a considerable extent, is temporarily at least if not permanently injurious. At first the alkaloid seems to excite the nervous system, to produce a pleasant sensation and to keep the mind agreeably enlivened and active. The effect is followed by depression, sinking sensation at the stomach, flatulency, unsteadiness with feebleness of muscular power, and not infrequently a lowness of spirits, amounting almost to hypochondriacal despondency. Poor people meet the craving for natural food by taking large quantities of tea. A strong craving for it is engendered which leads to the taking of tea at almost every meal, greatly to the injury of health. Poor women in the factory and cotton districts become actual sufferers from this cause. They are rendered anæmic, nervous, hysterical, and physically feeble. In the better classes of society similar if not such severe injury is effected by tea in those who indulge in it many times a day, and especially in those who indulge in what is called afternoon tea.... The afternoon tea or drum causes dyspepsia, flatulency, nervous depression and low spirits, for relieving which not a few persons have recourse to alcoholic stimulation.... Tea taken late in the evening, except immediately after a moderate meal, interferes with the sleep of most persons by causing indigestion, with flatulency, and sense of oppression. Some are kept awake entirely by the action of the tea on the nervous system; others get off to sleep, but are troubled with dreams, restlessness, and muscular startings. In a few incubus or nightmare is a painful symptom induced by tea.” In old people however, Sir Benjamin Richardson had not noticed such serious results “as persons advance in life the bad effects of tea sometimes pass away or are greatly modified.” But for the generality of people Sir Benjamin certainly felt very strongly about the matter for elsewhere he says “it causes in a large number of persons a long and severe and even painful sadness, there are many who never know a day of felicity owing to this one destroying cause.”[23]

Having generally reviewed the question of injury to health I now come to our own experiments. I first made inquiry into the strength of tea, as commonly consumed, and found that the usual quantity of black tea added was about eight grammes to the 600 cubic centimetres of boiling water. I next approached two well-known firms who kindly supplied me with samples of pure unmixed Indian, Ceylon and China teas.

Eight grammes of each sample were weighed out and were then infused in a tea-pot for five minutes with 600 cubic centimetres of boiling distilled water. At the end of five minutes the infusion was poured off and analysed for the percentage of extract, alkaloid, and tannin, and the following tables show figures for the Indian, Ceylon and China teas respectively.

TABLE E.

TABLE G.

ANALYSIS OF CHINA TEAS.

(Infusion of 8 grammes with 600 cc of boiling distilled water for 5 minutes.)

Wholesale Proportion Price Per Per Per of tannin No. Description and without cent. cent. cent. corresponding District. duty Extract. Alkaloid. Tannin. to 2·8 per lb. per cent. Alkaloid. 1 Fine Moning, 1/5 18·80 2·59 3·48 3·76 Hankow 2 Oolong, Formosa 1/1 24·00 2·46 8·76 9·97 3 Souchong -- 18·30 2·60 2·44 2·63 4 Moning 1/1 20·43 2·23 2·96 3·71 5 Scented Orange 1/2 23·81 2·68 7·70 8·04 Pekoe Canton 6 Gunpowder, Green 1/4 29·47 2·55 9·54 10·47 Tea 7 Caper, Green Tea 10⅜d. 21·45 1·87 9·08 13·59 8 Oolong 10d. 23·62 2·47 8·80 9·97 9 Hyson, Green Tea 1/4 26·81 2·32 9·62 11·61 10 Pakling 5½d. 18·77 1·81 3·19 4·93 11 Pekoe Souchong, 1/5 19·31 2·36 2·33 2·76 Lapsang 12 Panyang 4½d. 21·00 1·93 4·71 6·83 13 New make 8½d. 21·78 3·40 6·42 5·28

The last column in the above tables or the proportional amount of tannin is arrived at in the following manner. I first calculate the average amount of alkaloid in tea as consumed on a basis of the above figures. Thus the average amount of alkaloid in Indian teas as seen in Table H calculates out to 2·84 per cent. This is multiplied by the proportion of Indian teas on the market, viz. about 60 per cent. in the same way the average Ceylon alkaloid 2·68 is multiplied by 30, and the China average 2·40 multiplied by 6. If we add these products together and divide by 60 + 30 + 6 = 96 this will give us the average percentage of alkaloid in tea as consumed and this amounts to about 2·8 per cent. The last column in Tables E, F and G, gives the proportion of tannin corresponding to 2·8 per cent. alkaloid; that is to say the tannin in each case is multiplied by 2·8 and divided by the amount of alkaloid actually present. This figure which represents the proportional amount of tannin present renders the comparison of the different teas possible so far as the astringent action is concerned.

The following table summarises the results of analyses of the three classes of teas:--

TABLE H.

Proportion of Tannin Class of Number of Per cent. Per cent. Per cent. corresponding Teas. Analyses. Extract. Alkaloid. Tannin. to 2·8 per cent. Alkaloid. Indian Teas 18 26·11 2·84 7·43 7·32 Ceylon Teas 12 26·04 2·68 7·85 8·20 China Teas 13 22·12 2·40 6·08 7·09

Thus the Ceylon teas under the conditions of experiment part with slightly more tannin than the India or China teas. It will be noticed that the proportional tannin figures for the India and China teas are not very different, although some of the individual China teas give out less tannin than any of the India or Ceylon samples. It is possible that the China average is rendered rather high by an undue proportion of green tea which of course shows excess of tannin. The question will naturally be asked whether as a nation we do not drink too much tea, and there is a very simple means of solving the problem. As shown in table A the average consumption per head per annum in the United Kingdom is 6·1 pounds, or 117 grains of tea per diem. The average percentage of alkaloid in tea, as consumed, I calculate to be 2·8 per cent., and of tannin 7·5 per cent. This will mean that each person will take a daily dose of 3·28 grains of alkaloid and 8·8 grains of tannin. According to the last Census 3,716,708 out of 32,527,843, or 10 per cent. of the population of England and Wales, are under five years of age; these might almost be neglected as far as tea-drinking is concerned, so that we must add one-tenth to the average daily dose of the alkaloid and tannin, which will come to 3·6 grains of alkaloid, and 9·7 grains of tannin. The dose of caffeine according to the British Pharmacopœia is from one to five grains and of tannin from two to five grains. And hence on an average each person in the United Kingdom is constantly day by day consuming half as much alkaloid, and nearly as much tannin as would be permissible to be taken occasionally as a drug. Therefore I have no hesitation whatever in saying that we drink far too much tea, and the question has been raised in Ireland whether the excessive drinking of strongly infused tea has not had something to do with the increasing prevalence of insanity in that country. Thus in the Forty-third

Annual Report of the Inspectors of Lunatics, Ireland (1894), the Inspectors dwell on the ill effects of decocted or over infused tea on persons who make it a staple article of dietary, thus leading to the production of dyspepsia, which in its turn tends to states of mental depression highly favourable to the production of the various forms of neurotic disturbance.

Thus Dr. William Graham of the Armagh District Asylum refers to the recent changes of dietary having an unquestioned influence on the increasing prevalence of insanity. He refers to the use of Indian tea as a beverage between meals. “The tea,” he says, “is stewed, not infused, as a consequence the use of increased amount of nervine food leads to a peculiar form of dyspepsia, which in its turn leads to a general debility of the nervous system. This change is therefore to be considered as a factor in the increase of insanity.” Dr. G. W. Hatchell, the Resident Medical Superintendent of the Castlebar District Asylum, stated that “amongst the female inmates, I believe many cases of insanity may be attributable to the frequent consumption of decoction of tea, taken generally without food and for lengthened periods.”

Again Dr. Thomas Drapes of the Enniscorthy Asylum, said “there is not much evidence of the excessive use of this beverage (tea) being directly provocative of insanity, but I think there is very little doubt that its too liberal use excites or aggravates a predisposition to neurotic disorders, including insanity, making the nervous system more vulnerable in regard to such maladies, by the increased excitability of the nervous system which tea undoubtedly produces. A neurotic organisation may also be transmitted to their progeny by parents who drink tea to excess.”

Lastly, Dr. E. E. Moore of the Letterkenny Asylum, said “As to the consumption of tea, it seems to be enormous and increasing rapidly all over the country. I am informed that it is taken by young and old alike, and even by babes in the cradle. It is drunk as often as it can be got, at every meal and between meals, often six times a day, and especially by females and usually without milk, and often without food. I may safely say that it is never taken as an infusion, but is generally stewed for hours, the old leaves being left in the teapot and fresh added as required. In some places I am told the way the tea is made is by putting the leaves down in a saucepan of cold water, and then boiling it until the decoction is black enough to be palateable.... I can speak from practical experience of the terrible effects of this system of tea drinking both among the sane and insane. It gives rise to a severe form of chronic dyspepsia, and if persisted in to dyspepsia of an incurable and painful form. The result of all this is that the health of the people all through the county is deteriorating more than most people imagine. In fact the people are starving themselves on tea, and the weaker they become the more they rush to the teapot for the fillip the draught therefrom may give them for the moment. This tea-drinking is becoming a curse, and the people are developing a craving for tea, just as great as that which a drunkard has for alcohol, or a drug-taker for his own particular drug. There is no manner of doubt but that the condition of bodily health affects the mental health of every man, woman and child, and if the starved stomach becomes a prey to chronic dyspepsia the chances are very great that the mind will, before long, be materially affected especially where there is a predisposition to insanity of an hereditary type.” With these important testimonies from responsible officials, it is difficult to resist the conclusion that the abuse of tea drinking has acted as a factor in the increased prevalence of insanity.

As a general conclusion from my investigations I have no doubt that in the first place we drink too much tea; this is shewn by a simple calculation from the average annual amount imported for consumption. Of course children of tender years should obviously be given no strong stimulants (such as tea or coffee) and adults would be acting wisely to very much limit the amount taken. With regard to the best method of preparation it should be infused, (neither stewed or decocted) and certainly for no longer period than five minutes, and a good plan is to pour the tea off at the end of this time into another vessel so as to save further exhaustion from the leaves. In reference to the variety of tea best to use, although it is not certain that the average of China teas contains less tannin than Indian teas, there is no doubt that individual samples of China tea can be procured comparatively free from this deleterious substance.

With a view of discovering the constituent parts of the tea popularly consumed, I procured samples from each of the four leading Companies, which probably amongst them, supply nine-tenths of the tea drunk in London Restaurants. The infusion was made in exactly the same way as described above and the analyses came out as follows:--

TABLE I.

RESTAURANT TEAS.

(Infusion of 8 grammes with 600 cc. of boiling distilled water for 5 min.)

Proportion of Tannin No. Description Retail Per cent. Per cent. Per cent. corresponding and District. Price Extract. Alkaloid. Tannin. to 2·8 per lb. per cent. Alkaloid. 1 “China” Tea 2/2 20·20 2·51 4·85 5·41 2 Ordinary Black 2/2 25·60 2·04 9·03 12·39 Tea 3 “China” Tea 2/0 20·06 2·15 3·02 3·93 4 Ordinary Black 2/0 27·90 2·69 9·74 10·13 Tea 5 “Russian” Tea 2/6 23·50 2·30 5·36 6·52 6 Ordinary Black 2/8 24·60 3·02 6·03 5·59 Tea 7 “China” Tea 2/4 24·50 2·22 5·85 7·37 8 Ordinary Black 2/2 28·31 2·72 8·44 8·69 Tea

It will be observed that the China teas exhibited a fairly low proportion of tannin. The numbers for ordinary black tea in two of the Companies’ samples were, however, considerable. This points to the advisability of teas being analysed before being placed upon the market, and this is a reform much needed in the interest of the public. The tea should be examined for the amount of the alkaloid, and also the tannin extracted by infusion, and the price based on the proportion of the essential ingredient, viz: the alkaloid and if it is desired to place the matter on any sort of scientific basis, the public should in each case be informed of the weight of tea required to be used with boiling water (this being regulated by the quantity of the alkaloid), and at the same time an indication should be given of the proportion of tannin liable to be extracted in a standard infusion. My general recommendations from the foregoing experiments, and also from the experience of the various authorities are that if tea is to be no longer a source of injury to health we should drink much less, and infuse for a briefer period. The dealers also should more frequently submit samples for analysis as in the case of other foods and drinks; thus when we _do_ drink tea we should be in a position to avoid those varieties which are especially harmful; and there is no doubt that if these recommendations are carried out we shall be saved from a number of distressing complaints which, although very rarely fatal, have in the past occasioned much ill health, and have been a source of discomfort and misery both of mind and body to thousands who might otherwise have enjoyed the comfort to be derived from a carefully regulated use of the infusion of the leaves of the tea plant.

Dishes made without meat

Mrs. C. S. Peel

Project Gutenberg Release: November 14, 2022 · eBook #69346

MRS. C. S. PEEL'S COOK-BOOKS

DISHES MADE WITHOUT MEAT

BOOKS BY MRS. C. S. PEEL IN CONSTABLE'S HOME SERIES

The Simplified Series of Cook-Books.

A new and useful series of books for the Kitchen. _Crown 8vo._ Price 1_s._ _net_ each volume.

The first four volumes are:--

ENTRÉES MADE EASY. PUDDINGS AND SWEETS. SAVOURIES SIMPLIFIED. THE STILL-ROOM. A Few Recipes, Old and New.

Ten Shillings a Head per Week for House Books.

An Indispensable Manual for Housekeepers. _Crown 8vo._ Price 3_s._ 6_d._ 5th edition.

The Single-Handed Cook.

More Recipes. _Crown 8vo._ Price 3_s._ 6_d._

How to Keep House.

Crown 8vo. Price 3_s._ 6_d._

The New Home.

Treating of the Arrangement, Decoration, and Furnishing of a House of Medium Size to be maintained by a Moderate Income. A New Book for the Mistress of the House, with a Chapter of special interest on Colonial Housekeeping. Fully Illustrated. 2nd edition, revised and enlarged. _Crown 8vo._ Price 3_s._ 6_d._

MRS. C. S. PEEL'S COOK-BOOKS

DISHES MADE WITHOUT MEAT

BY MRS. C. S. PEEL

Author of "10/- a Head for House Books," "The Single-handed Cook," "How to Keep House" and "The New Home"

LONDON ARCHIBALD CONSTABLE & CO LTD. 1907

NOTE

Fish dishes are not treated of in this book, as they will be found in the Volume of the series--entitled _Fish and How to Cook it_. Also, as these little cook-books are intended primarily for households where both time and money must be economized, the recipes are neither over elaborate nor over expensive.

CHAPTER I

VEGETABLE DISHES

There is undoubtedly a great and growing liking for _maigre_ dishes, not only amongst those people who eat them from religious motives, but amongst the general public. Nowadays at most of the smart restaurants vegetable and cereal dishes are a feature of almost every meal, and at private houses no luncheon and few dinner menus are considered complete unless a vegetable or cereal dish is included.

But apart from fashion the value of these dishes is great; they are good for the health and good for the pocket of the housekeeper, provided they are ordered with discretion.

In the country, where vegetables are plentiful and money is not, I have often noticed that sufficient use is not made of vegetables, while where fresh green food is a luxury its place is not taken--as it should be--by such food stuffs as rice, macaroni, haricot beans and corn.

As the housekeeper whose weekly income is limited knows only too well, there often comes a day when the supply of meat falls short. Then comes the question, can it be eked out in a presentable manner or must more be bought and the desired cost exceeded. Now the woman who caters carefully will realize how such inexpensive materials as rice or macaroni, potatoes or cabbage may be pressed into service.

For example, the only available meat dish for luncheon is a hot pot of mutton and the party is suddenly augmented. Add to the menu a dish of macaroni au jus, or a rissole or corn curry, and supplement the homely pudding with a little cheese savoury, and what more can any one desire?

Then if the meat for a veal and ham pie is scarcely sufficient add a liberal quantity of partly cooked macaroni cut into short lengths, while should the quantity of minced mutton available seem sadly little, add an ample border of savoury rice or an extra dish of

potato and cheese balls. If rissoles are required add to them by means of mashed potato or rice.

Then never allow small quantities of cooked vegetables left over from lunch or dinner to be thrown away. Place them on clean plates in the larder; they will prove useful additions to the next day's bill of fare.

For example, you have two or three young carrots, a cupful of peas, even a smaller quantity of broad beans. Slice the carrots and arrange all three vegetables in china shells, mask with mayonnaise sauce, sprinkle with coralline pepper, and serve with cold meat, or reheat them by steaming, place them in a hot fireproof dish, cover with boiling hot maître d'hôtel sauce, and garnish with rolls of bacon, and serve as a luncheon dish; or add a little onion and use for a vegetable curry, and serve surrounded by well-boiled rice; or reheat, mix with parsley and butter sauce, cover with mashed potato, score the top and brown in the oven, and serve for luncheon in the guise of vegetable pie.

If some new potatoes are left over, slice, fry, and serve with or without bacon for breakfast; while should you have some old boiled potatoes to use up they may be mashed and employed in half a score of ways; incorporated with cabbage, pepper, salt, and a little butter, formed into cakes, and fried to serve with bacon, grilled chicken or ham, for instance.

Thus the clever housekeeper economizes and yet does not allow her economies to be apparent.

Before passing on to the recipes which are the _raison d'être_ of this little volume, I would say a word on the treatment of vegetables.

It is the habit of gardeners to pick fruit, vegetables, etc., in the morning, and to bring in the day's supply at about eleven o'clock, and on Saturday to provide sufficient for two days' consumption. Except in the case of strawberries (which should be gathered, if possible, on the day on which they are to be eaten) and asparagus (which is infinitely better when cut just before the time for cooking), there is no objection to this plan, provided the garden produce is stored in the best manner. Carrots and turnips, leeks and onions should be placed in wire racks; and lettuces should be arranged root-end downmost in a shallow pan of fresh water. Cabbages and cauliflower may be treated likewise. Parsley should be placed in water as if it were a flower--not soused head over heels in that liquid. Whether the stalk-end of a cucumber should be placed in water, or whether the vegetable should be left dry in a cool, airy place, is a moot point. I do not feel competent to say which course should be followed, but my cook, who is clever at cooking vegetables, opines that cucumbers should not be placed in water; and, in any case, that they should not be kept long when cut.

Mustard-and-cress should be arranged in a shallow pan of water.

Peas and broad beans should not be shelled unnecessarily long before eating, and if it is necessary to keep them they should be placed in a wire rack in a cool, well-ventilated place.

All vegetables should be eaten while young, or they lose considerably in flavour. When French or runner beans are quite young it is better merely to remove the strings and to cook them whole; but when old age approaches they are more palatable when sliced.

To Boil Vegetables

When boiling vegetables remember that all fresh vegetables should be plunged into boiling salted water, the proportions being 1 tablespoonful of salt to 1 gallon of water.

Dried vegetables should be placed in lukewarm water.

A piece of sugar put into the water in which green vegetables are cooked helps to bring out the flavour.

Leave the cover off the pan in which vegetables are cooked, or, at all events, leave it half off, so that the steam can escape easily.

Do not allow vegetables to stay in the water in which they are boiled, but drain them at once, pressing out all the water possible.

Green vegetables take on an average about 20 minutes to cook, though 10 minutes is often long enough for young peas, while cabbages sometimes take nearly an hour.

The best way of cooking peas is as follows:--Shell a pint of peas and place them in a jar with a closely-fitting lid, put in with them a saltspoonful of salt, a tablespoonful of butter, a teaspoonful of powdered white sugar, a sprig of mint and a shake of black pepper. Cover the jar closely and place it in a saucepan of boiling water. Boil briskly, until done, which should be in ½ an hour to ¾ of an

hour.

Peas with Béchamel Sauce (Hot)

Cook the peas as in the preceding recipe, and just before serving pour over them a small quantity of Béchamel sauce.

Petit Pois au Beurre (Hot)

Peas with Butter

Having cooked the peas either by the method described above or having boiled them in the ordinary way, drain off the water and shake the peas to dry them well, return them to the hot dry pan they were cooked in, and at the last moment before serving throw in a pat of butter, let this just melt, and serve.

French Beans

À la Crême de Fromage (_Hot_)

Cook the beans in the usual way by throwing them in boiling salted water in which a teaspoonful of sugar has been placed. If young, cook them whole, only removing the spines and pointed end, or if stock can be used, place them in a pan which has been buttered, sprinkle them with salt, and just cover them with stock. When tender place them on a hot dish, make a white sauce with ½ oz. of butter and ½ oz. of flour mixed with ½ pint of the stock in which the beans have been cooked, add a good pinch of salt and stir well, adding one well-beaten egg and two tablespoonsful of finely-grated cheese. Do not let the sauce boil after the egg has been added or it will curdle. Pour round the beans and serve.

French beans can also be served with Béchamel sauce or quite plainly with a small quantity of butter melted and run over them, with a shake of pepper and salt, or again with a plain melted butter sauce.

Flageolets

Flageolets are the beans of the kidney bean, French bean, etc., and when shelled and cooked in various ways are excellent eating. They should be boiled in the same way as peas, simply omitting the sprig of mint, and can be served in various ways.

Flageolets au Beurre (Hot)

Having boiled and drained the beans, place a pat of butter in the saucepan just before serving.

Flageolets au Maître d'Hôtel (Hot)

Make a butter by mixing 1 oz. of butter, the juice of ½ a lemon, a teaspoonful of chopped parsley, a pinch of salt and pepper, mix well and form into a pat. When the beans are cooked and drained, place this with them, shake and serve.

Flageolets à la Crême de Fromage (Hot)

(_With Cheese Sauce_)

Follow the directions for French beans, substituting flageolets, and boiling in the ordinary way.

Cabbage with Cheese Sauce (Hot)

Boil a cabbage, cut it in 8 pieces, then place it in 1 pint of cheese sauce, make it thoroughly hot, and serve with the sauce poured over it.

Cabbage à la Crême (Hot)

Drain a boiled cabbage, cut it up small, put it into a saucepan with 1 oz. of butter, 1 gill of cream, and a seasoning of pepper and salt, stir it all together over the fire till thoroughly hot, then turn it out on to a hot dish, and serve with fried croûtons.

Brussels-Sprouts

can be served in various ways. For au beurre after boiling, drain well, taking great care to squeeze every drop of water possible from the sprouts, return to the pan and toss in butter, and dust with pepper and salt.

Brussels-Sprouts à la Maître d'Hôtel (Hot)

Follow the above recipe, substituting maître d'hôtel butter for ordinary butter.

Brussels-Sprouts au Jus (Hot) with Stock

Blanch the sprouts, by dipping them in boiling water and letting them remain in it for a few minutes. Remove them and drain well, placing them in a pan with just enough stock to cover them. Simmer until tender, drain and serve.

Boiled Nettles (Hot)

Choose very young nettles, and wash them well in two or three waters; chop them up very fine, and put them into a stewpan with a little water, and steam until quite tender. Meanwhile toast as many slices of bread as required, trim these neatly, lay them on a hot dish, drain the nettles well, serve on the hot toast, dusted with pepper and salt, and serve with a beurre fondue sauce, made as follows:--Put 2 oz. of butter into a clean saucepan with ½ a teaspoonful of salt, and half as much pepper, and 1 dessertspoonful of lemon juice; stir these all together over the fire until half melted, take it off the fire and continue stirring until the butter is all dissolved.

Stewed Nettles (Hot)

Wash the shoots and young leaves of nettles very thoroughly in slightly salted water, dry well and mince very finely. Put this into a stewpan with 1 tablespoonful of finely-chopped onion, a suspicion of brown sugar, season with pepper and salt to taste, pour in a little stock or water, and stew gently at the side of the fire until quite tender; then mix together 1 oz. of butter and 1 teaspoonful of salt, till perfectly smooth, add this to the nettles, with ½ a tablespoonful of thick cream or new milk, stir it all well together till quite hot, and serve on slices of hot toast. If liked, the onion may be omitted, when the nettles are treated exactly like spinach.

Purée of Watercress (Hot)

Wash some watercress well, getting rid of all faded or discoloured parts, then put it on in plenty of boiling salted water, and boil it till almost cooked; lift it out, and drain on a sieve or colander to get rid of as much water as possible. Meanwhile melt about 1½oz. of butter in a pan, put the watercress on in this, sprinkle it lightly with flour, and stir it all together over the fire for about 10 minutes, then add about 2 gills of good stock, season with pepper and salt; cook it for 10 minutes longer, stirring it continuously, rub it through a sieve and serve very hot, garnished with quartered hard-boiled eggs, and fried croûtons.

Stewed Lettuce

Treat exactly as in the previous recipe.

Purée of Turnip Tops

Proceed as for watercress or lettuce.

Cauliflower with Tomato Sauce (Hot)

Clean and soak the cauliflower in salt and water for 1 hour, then plunge it into boiling water, returning it again to cold water. After this put it in a pan of boiling water slightly salted (½ oz. of salt to 1 gallon of water) and boil it until tender, 20 to 25 minutes. In the meantime make ½ pint of tomato purée by the following recipe, and when the cauliflower is cooked place it on a hot dish, pour the purée over it, sift some finely-grated brown crumbs over it and serve.

Tomato Purée

Six smallish tomatoes. Cut them into slices and place them in an enamelled saucepan, add 1 oz. of butter, a teaspoonful of chopped parsley, salt, pepper, and a tiny pinch of cayenne. Pour over one pint of stock. Boil until quite soft, and then pass through a sieve, add 1 oz. of anchovy essence, thicken with ½ oz. of butter and ½ oz. of flour previously mixed together in another pan with

some of the tomato mixture. Stir over the fire until the sauce thickens, and it is then ready for use.

Cauliflower Fritters (Hot)

Break a cooked cauliflower up into neat pieces, dip these in frying batter till well covered, and fry in boiling fat. Drain them well, sprinkle with grated Parmesan cheese and coralline pepper. Serve at once on a napkin.

This is an excellent way of serving cauliflower which has been left over.

Cauliflower au Gratin

Boil the cauliflower as before, place it in a fireproof dish, pour over it an ample quantity of cheese sauce, sprinkle with grated cheese and brown crumbs and bake until slightly brown on the top. For cheese sauce see the recipe for French beans à la crême de fromage (page 12).

Cauliflower with Soubise Sauce

Boil the cauliflower, place in a fireproof dish. Cover with delicate onion sauce (Soubise sauce, p. 47), sprinkle with brown crumbs and make very hot in the oven.

Spinach Patties (Hot)

Take 1 lb. of spinach leaves, pick and wash them well, and after this blanch them by plunging them for 5 or 6 minutes in boiling water, drain them and place them in cold water, remove, press, and strain, to get rid of as much moisture as possible. Chop them up, place in a stewpan a pinch of salt and sugar, ½ oz. of butter and ¼ oz. of flour, and after stirring this for a few minutes add the spinach. Stir for 5 minutes then add ¼ pint of milk, stir for a few minutes longer, and then add ½ pint of milk, stirring steadily until the liquid is almost dried up. Remove from the pan and pass through a sieve, then return to the fire and add a small pat of butter and keep very hot. Have ready the required number of pastry patty cases. Quickly make some buttered egg, place some of the spinach in each case, with a spoonful of buttered egg on the top, and serve at once very hot.

Spinach and Tomatoes (Hot)

Prepare the spinach as in the preceding recipe. Bake six small tomatoes carefully in the oven with a piece of butter on each. When ready arrange the spinach in a dish in the form of a border, place the tomatoes in the centre and serve.

Épinards (Spinach) à la Crême (Hot)

Wash the spinach in six or seven waters, so as to prevent its being gritty; put it in a saucepan on the fire, with a very little water and salt; when done strain very dry and chop it up very fine. Warm 2 oz. of butter in a stewpan, put the spinach in, stir till the moisture quite evaporates, then add a very little salt, a tiny pinch of sugar (a very little nutmeg, if liked), a pinch of flour, and 1 large tablespoonful of cream, and let the whole simmer for a quarter of an hour. Then put through a sieve and keep hot. In the meantime, fry in fat some bread cut into fingers, about 2½ in. long and ½ in. square, and plant them in little rows all over the spinach when dished.

Spinach cooked thus is delicious and a very different matter from the stringy green mass generally served.

Turnip Tops à la Crême

Cook as in the previous recipe for spinach.

Almost any greens, including cabbage and Brussels-sprouts, are excellent when served thus.

Asparagus.

Asparagus is really almost at its best served plain boiled with oiled butter; but when it first comes in, the big kind, which is best for boiling, is rather expensive, and few people seem to know how good the more “grasslike” kind is if treated properly.

Boiled Asparagus (Hot)

Although every one will at once say they know how asparagus should be boiled, yet it is a melancholy fact that it is not by any means an invariable rule to find this vegetable properly treated. If, however, the following directions are carried out the result is certainly worth the little extra trouble. Cut the stalks of a bundle of fresh asparagus evenly and tie them up into a bunch, put them upright into a pan just large enough to hold them comfortably and with boiling water to within about 3 in. of the tops. Keep them on the fire for from 30 to 40 minutes, then lift them out, drain well, remove the string, and dish them on a neatly folded napkin or square of toast. Treated in this way, the heads are not so apt to come off, and the stalks, instead of being tough, are quite tender and eatable. Excellent asparagus cookers are now made, but if one of these is not to hand its lack will not be felt if the instructions already given are observed. Asparagus should be served with

Plain Oiled Butter, or Beurre Fondu,

which is made as follows:--Put 2 oz. of fresh butter into a pan with 1 saltspoonful of salt, ½ a saltspoonful of pepper, and ½ a tablespoonful of lemon juice; stir this over the fire with a clean wooden spoon till the butter has rather more than half melted; then lift it off the fire, and continue the stirring until the butter is entirely melted, when it will have a creamy taste, quite different from the ordinary oiled butter.

Asparagus au Jus (Hot)

Cut the young, green, small asparagus diagonally into equal lengths (like French beans), and toss these lightly in bacon fat; when slightly crisped, season with white pepper, salt, minced parsley, and chervil, and add a little stock; simmer gently till cooked. Now add a spoonful or so of good beef or mutton gravy, and serve. The great secret of this dish is only to put in enough stock in the first instance to cook the asparagus, for it should all be absorbed by the time you add the gravy.

Asparagus Sprue à la Pompadour (Hot)

Steam the sprue, or small asparagus, in boiling salted water (_see_ p. 21), cut into lengths as above, and let them dry in a well-heated napkin, in a warm place, to keep hot. Meanwhile stir together some fresh butter, the yolk of 1 or more eggs, a spoonful of vinegar, a dust of salt, and some freshly-ground black pepper; stand the pan containing this in another pan half-full of boiling water, and stir it over the fire till thoroughly blended. Place the asparagus in the dish, pour the sauce over it, and serve.

Iced Asparagus

For this the large asparagus is required. When cooked lay on ice or keep in an ice cave. Serve in an entrée dish and hand very cold mayonnaise sauce.

CHAPTER II

VEGETABLE DISHES

(_Continued_)

Potatoes

A favourite kitchen superstition is that which forbids the use of left-over potatoes. For many dishes cooked potato is required. Why then cook fresh potatoes for the purpose and thereby waste time and money?

The sensible cook keeps all left-over potato, and makes use of it in some of the ways here described.

Potato Croquettes (Hot)

Take 1 lb. of cold cooked potato and place in a mortar. Mash it until all the lumps have disappeared, add a pat of butter and enough milk or cream to make the potato soft, and of the right consistency to form into balls, add a tablespoonful of chopped parsley, a very small quantity of chives (if liked), mix well and form into balls. Coat them with egg, roll them in finely-grated breadcrumbs, fry a golden brown, drain and serve.

Potatoes à la Crême (Hot)

Having washed and peeled the number of potatoes required, cut them into very thin slices and as much the same size as possible. Place them in cold water for ½ hour, then drain them and dry on a soft clean cloth. Have ready a fireproof dish with a closely-fitting lid, butter the bottom and sides of it, and place a layer of potatoes in it, laying them to overlap each other, and also to stand round the sides, place on these a layer of soft butter, and a sprinkling of salt, and continue in this way until the dish is full, ending with a layer of butter. Place the lid on firmly, and place the dish in a moderate (350 deg.) oven for ¾ of an hour.

Cheese Potatoes (Hot)

Follow the previous recipe, the only difference being that grated cheese should be sprinkled between each layer of potato in addition to the butter.

Potatoes à la Crême (Hot)

(_A Method of Using up left-over new Potatoes_)

Put into a pan from ½ to 1 oz. of butter, add a good dessertspoonful of flour, some parsley and minced chives, with salt, pepper, and a dust of nutmeg to taste; when the whole is smoothly blended, pour in sufficient single cream or new milk, and stir it all together till it boils up, then add as many cold, cooked new potatoes as you want, and allow them to heat thoroughly in the sauce without actually boiling, which would break them; serve with a dust of coralline pepper.

Potatoes au Gratin (Hot)

Well butter a gratin dish, and dust it liberally with minced parsley, white and coralline pepper, and, if liked, a little grated Parmesan; cover this with a layer of thinly sliced, cold, cooked new potatoes, moistening them as you do so with a little cream, milk, or, failing either of these, a little oiled butter, dusting the whole with minced parsley, pepper, salt, and a very little cheese; repeat these layers till the dish is full, finishing with a very light sprinkling of fine white breadcrumbs, a little spice, grated cheese, and, lastly, some tiny morsels of fresh butter, and bake till the surface is nicely covered.

Potato and Cabbage Cakes

Take any cold potato and cabbage, mash it smoothly together, adding beaten egg, white sauce, or melted butter to moisten. Flavour rather highly with pepper, add a little salt. Form into round cakes, flour, and bake or fry.

Curried Potato Cakes

Have ready some curry sauce with which to moisten the mashed potato, and proceed as before.

Potato Cromeskies (with Mushroom)

Have ready some well-flavoured mushrooms stewed in white sauce (the mushrooms cut into small pieces). Make some smoothed mashed potato and add to it a beaten yolk of egg. Form balls of the potato. Hollow out a place in each, fill with the mushroom mixture. Cover with more potato, egg, crumb, fry and serve very hot.

Potato Mould (Hot)

Mash 1 lb. of well-boiled potatoes with the same quantity of boiled mashed carrot, pass through a fine wire sieve, mix all well together with warm milk, and a lump of butter; place in a buttered mould, and set in a hot oven for 10 minutes, turn out on a hot dish, and brown in the oven.

Artichokes au Gratin (Hot)

Wash and peel the artichokes and place them in cold salted water, then put them in a pan full of boiling salted water. Boil for 20 minutes. (If the artichokes are old they should be put into cold water, which must be brought to the boil and kept so until they are cooked.) Take the artichokes out and drain them, cut into pieces, then place them in a fireproof dish, covering them with a good white sauce. Sprinkle with grated cheese. Place in a moderate oven, and bake about 10 to 15 minutes until of a golden brown.

Scalloped Artichokes

Cook as in the previous recipe, but omit the cheese and bake in shells which have been buttered and sprinkled with brown crumbs. Sprinkle the artichoke mixture with crumbs also, place a little butter on the top and brown as before.

Artichoke Soufflé

See page 48.

Artichoke Chips

Cook as before; slice, fry in boiling fat. Drain and leave till cold. Fry, drain, and serve very hot.

Cream of Artichokes (Hot or Cold)

Boil 1 lb. of artichokes until quite tender, then pass them through a sieve. Make a custard with ½ pint of milk and the yolks of four eggs, pepper and salt. Whisk up the white of 1 egg, and whisk this into the custard, mix it with the artichoke and place all in a well-buttered mould and steam for an hour. Serve hot with anchovy sauce, or set the mould on ice, and when quite cold turn it out on to a dish and serve with iced mayonnaise of hollandaise sauce.

Eggs and Artichokes (Hot)

Boil 8 artichokes and cut them into slices, place them in a fireproof dish. Hard boil 4 eggs. When cold shell them and chop them up, place the eggs on the top of the sliced artichokes, and pour over the whole a good white sauce flavoured with Parmesan cheese. Dust over with breadcrumbs and make thoroughly hot in the oven.

Bouchées d'Artichauts (Hot)

Prepare the green artichokes by cutting off the leaves close down to the fond and trim off any that may adhere, cut off the stalk as closely as possible. Plunge the artichoke bottoms into boiling salted water, and leave them for five minutes, then take them out and remove the choke. Place in boiling water and boil them until tender. When cooked take them out, drain them, and put them through a sieve, season with pepper and salt, moistening the whole with enough white sauce to make a purée. Have ready some pastry patty cases, ready cooked, fill each with the mixture, and serve very hot.

Fonds Artichauts au Gratin (Hot)

Boil the artichoke bottoms in the manner described above, mash them and season with pepper and salt, adding a little cream and butter, place some of the mixture in china shells or small fireproof dishes, grate some cheese over each, and bake in the oven until a golden brown.

Stuffed Artichokes.

Take the cooked artichoke bottoms and fill with mashed potato flavoured with cheese. Brown in the oven and serve with cheese sauce.

Artichokes with Cream Cheese

Fill the artichoke bottoms with cream of cheese (_see_ page 71), and serve on buttered toast very hot.

Mushrooms au Gratin (Hot)

Peel the mushrooms and cut off their stalks, and place them in a buttered fireproof dish. Peel the stalks and wash them, add the peelings, dry them and cut them up. Make a sauce with 1 oz. of butter, and when melted add ½ oz. of flour, stirring into it ½ pint of milk. Stir well, bring to the boil, and then throw in the chopped stalks, a dessertspoonful of finely-chopped parsley, a teaspoonful of finely-chopped onion, a dusting of pepper, and ½ a teaspoonful of salt. Simmer the sauce until it thickens, strain and add some browning. Pour the sauce over the mushrooms, sprinkle some browned breadcrumbs over the whole, and bake in a quick oven for 10 minutes.

Mushroom Croûtes (Hot)

Cut some rounds of bread about ¾ of an inch thick and scoop them out rather thinner in the centre, fry until a golden brown, drain, and keep hot. Place the required number of mushrooms on a greased baking-tin with a piece of butter in each, and place in the oven to cook. In the meantime mince one or two mushrooms and place them in a pan with a small quantity of good brown sauce. When cooked place a spoonful on each croûte, and a whole mushroom on the top of each. Serve very hot.

Roes and Mushrooms on Toast (Hot)

Make the necessary number of round croûtons of lightly-fried bread, and choose a like number of mushrooms the same size as the croûtons. Peel the mushrooms, rinse them in warm water, to remove any grit, and remove the stalks. Place them on a greased baking sheet, stalk side uppermost. Put some small pieces of butter on each mushroom and a little pepper and salt. Cover with buttered paper and cook in a moderate oven for 10 to 20 minutes. Serve a mushroom on each croûton, and on each mushroom place a cooked bloater roe curled round.

Stuffed Aubergines (Egg Fruit)

Boil the aubergines until tender (25 to 30 minutes), and then half them lengthwise. Scoop out the pulp carefully, sieve it, and mix it with some fine brown crumbs (about a dessertspoonful to each half-pint), pepper, salt, and some oiled butter. Fill the skins with this mixture, sprinkle with crumbs and oiled butter, and bake in a moderate oven until browned.

Tomatoes au Gratin (Hot)

Take four tomatoes as nearly the same size as possible, and a slice off the top of each. Scoop out the middle of the tomato as much as possible, leaving the frames for cases. These set on one side. Work the pulp through a sieve, and mix into it a heaped-up tablespoonful of finely-grated breadcrumbs, add the yolks of 2 eggs, and mix well. Fill the tomato cases, heaping the mixture up, grate a layer of cheese over them, place on a buttered baking dish and bake for 10 minutes.

Tomato Pie (Hot)

Slice a good-sized onion thinly, blanch it, and fry in fat till lightly browned. Take 1 lb. of ripe tomatoes, skin and cut in slices. Place a layer of onions in the bottom of the pie dish with a good seasoning of salt and pepper, then a layer of tomatoes, with white breadcrumbs scattered over and a few pieces of butter, and so on until the dish is almost full. Have ready some well-mashed potatoes, and spread thickly over so as to form a crust, and bake until brown.

Tomatoes à la Crême de Fromage (Cold)

Whip ½ pint of cream until stiff, season it with celery salt and pepper. Add 3 oz. of grated cheese, then whisk in by degrees ¼ pint of cool but liquid aspic jelly, which has been flavoured with tarragon vinegar. Continue to whisk until the mixture begins to stiffen. Previously peel and halve some small round tomatoes, and remove the seeds from the halves when cut open, and drain for a little. Place each piece of tomato, when filled, on a cheese biscuit, and ornament it round the edge with a piping of cheese cream. Garnish the dish with cress, and put a tiny bunch into the middle of the cream with which the tomatoes are filled.

Tomato Canapés (Cold)

Cut some slices of bread 2½ in. in diameter, and ■ in. thick. Soak in milk and then fry a pale colour. Spread when cold with grated cheese and butter made into a paste. Dip some small tomatoes into hot water, skin them and put one on each piece of bread, placing some finely-minced parsley and grated Parmesan on each.

Beignets of Vegetable Marrow (Hot)

Peel the vegetable marrow and strain it without removing the seeds. When three-parts cooked, take it out of the pan and cut it into neat pieces, as much one size as possible, remove the seeds, dip each piece of marrow into batter and fry until a golden brown in boiling fat.

To Make the Batter

Whip two eggs and mix them with about two tablespoonsful of flour. This is generally sufficient to make a stiff batter. Then add by degrees ■ of a pint of milk, salt and pepper, cover and put by for an hour or two. Be sure that the article to be fried is quite dry

before being dipped in the batter.

Salsify Scallops (Hot)

Boil the salsify for 50 minutes, then place in a mortar and mash to a pulp, add a few drops of anchovy essence and some milk or cream, to make it the consistency of a thick custard. Place the mixture in buttered shells, sprinkle some finely-grated breadcrumbs over it, place a piece of butter on each and brown in the oven.

Salsify Fritters (Hot)

1½ lb. salsify, 2 oz. beef dripping, lemon juice. Wash and lightly scrape the salsify roots and put them in cold water. Put the dripping, a little salt, and the lemon juice in a saucepan with enough water to cover the salsify. When it boils put in the roots and let them simmer gently until they are tender. This will take 30 to 40 minutes. Do not cover the pan. When tender drain off the water and cut the roots into pieces about 2½ in. long. Sprinkle the salsify with a little pepper, oil, and vinegar, and then dip the pieces into batter. Fry in boiling fat until a golden brown, then take out, drain and serve.

Glazed Carrots (Hot)

Blanch some small, young carrots, as much of a size as possible, dry them well, and if necessary, trim them evenly; put them into a pan, with just enough stock to cover, and a lump of loaf sugar; boil them up sharply till the stock is reduced to a glaze, then add to this 1½ oz. of butter and a seasoning of salt, and stir them in this till the liquid is all absorbed, and the carrots are quite glazed with the butter.

Carrots à la Flamande (Hot)

Take about 12 young carrots, blanch them in scalding water, and rub them well. Then put them into a stewpan with about 1 oz. of butter, a saltspoonful of castor sugar, some finely-minced parsley, a seasoning of pepper and salt, and sufficient water to cover them liberally; simmer the carrots in this for about 15 to 20 minutes, when they should be quite tender, shaking them once or twice in the process. Remove the pan from the fire, and stir in the yolk of 1 egg beaten up with 2 spoonsful of cream or new milk, and serve very hot.

Glazed Turnips (Hot)

Peel about 1 lb. of young turnips, wash them well, cut into quarters, and put them on in salted water; bring this sharply to the boil, then place them in a well-buttered small frying or sauté pan, sprinkle them liberally with castor sugar, and directly the turnips begin to colour pour a little stock in, and season with pepper and salt, and a little more sugar if liked; let them stew slowly till quite tender, and serve them with the sauce poured over them.

Turnips à la Poulette (Hot)

Peel about 1 lb. of young, fresh turnips, wash them well, trim into olive or pear shapes; put them on in cold, salted water, and bring them sharply to the boil; then drain them, rinse in cold water, and dry them in a clean napkin. Have ready some velouté (i.e. melted butter made with 1 oz. of butter, 1½ oz. of flour, and about ¾ pint of vegetable stock instead of water), drop the turnips into this, and cook them till ready, very gently, for about 20 to 25 minutes according to size. When ready lift them out, and keep hot. Add a spoonful of castor sugar to the liquor, boil it up sharply, and just before serving stir in the yolk of an egg and a little piece of butter cut up small; do not let the sauce reboil after adding these; season to taste with pepper and salt, pour the sauce on to the turnips, and serve very hot.

Onions au Gratin

Blanch (by placing in boiling water) 1 lb. of onions, then divide them into quarters and boil in milk and water until tender. Cut them up, moisten them with some of the liquid in which they were boiled, mash them smoothly, add a cupful of cream, or one of milk enriched with the yolk of an egg, pepper and salt. Place the purée in a fireproof dish, which has been buttered, strew some grated cheese over, and sprinkle a little melted butter over all. Bake until hot throughout, and until the top is coloured.

It is worthy of note that where grated cheese is mentioned, it is quite unnecessary to buy Parmesan for the purpose. Any dry ends of cheese, grated, will serve.

Celeri à la Duchesse (Hot)

Cook some celery slowly in equal parts of milk and water, seasoned with salt and pepper; when cooked, lift out, cut it up, and place a layer of it in a fireproof dish, seasoning with salt and pepper, and moistening with some béchamel or any good white sauce, and continue these layers until the dish is full, taking care to raise it up in the centre; strew it rather thickly with grated Parmesan cheese; moisten it with some oiled butter, and put it into the oven for 10 minutes, to colour nicely.

Fried Celery (Hot)

Thoroughly wash three heads of celery, remove the leaves, and cut into 4 inch lengths, then put in a stewpan with ½ a pint of stock and a seasoning of pepper and salt. Simmer gently for a quarter of an hour. Let the celery cool, then take it out, dip it in egg and breadcrumb, and fry in butter. Serve very hot, and hand tomato sauce with it.

For the following vegetable dishes, _see 10s. a Head for Housebooks_:--

Potato Cakes, Ribbons, à la Maître d'Hôtel, Balls, Cones, Eggs au Gratin, Tomato Savoury, and Cabbage Cakes.

Cauliflower au Gratin, and Curried.

Seakale au Gratin, Curried, Fried, with White Sauce.

Onions en surprise.

Tomatoes, with Eggs, Roasted.

Vegetable Pie.

CHAPTER III

How to Cook Corn, Haricot Beans, and Lentils, and to Make Vegetable Soufflés.

Of all the cereals none, I think, yields a better result than corn--known to some people as green, and to others as Indian corn or maize. Freshly cut, boiled, and eaten with salt, pepper, and oiled butter, it is delicious; but every one, alas, does not grow it, and many folk have to be content with the tinned corn, which, nevertheless, is excellent. It may be bought in tins of two sizes, and is quite inexpensive.

To Cook Corn

Open a small tin of corn and strain off the liquid, and then simmer the corn until tender, but not “mashy,” in 3 tablespoonsful of milk, ½ oz. of butter, pepper and salt. About 10 minutes will suffice for the cooking.

Corn with Buttered Egg

Have ready the buttered egg, and pile it in the centre of a hot fireproof dish, surround with the cooked corn and garnish with small circles of fried bread.

Egg and Corn Toast

Prepare the egg and corn as before, stir them together and serve very hot on buttered toast.

Corn with Poached Eggs

Spread the cooked corn flat on a hot fireproof dish, and arrange the poached eggs neatly on it, and serve very hot.

Corn au Gratin

Cook the corn as before, and have ready a delicate white sauce as below. Heat a fireproof dish, butter it, and sprinkle with fine brown crumbs. Heat the corn in the sauce, and place it in the dish, cover with grated cheese and crumbs, and bake for 20 minutes in a hot oven.

White Sauce

Melt 2 oz. of fresh butter, and sprinkle into it 1½ oz. of dry sifted flour. Stir until the sauce will leave a clean place in the pan when lifted in the spoon. Add quite gradually ½ pint of milk, stirring all the time. Bring to the boil, and cook for 10 minutes. Season with salt and white pepper and a squeeze of lemon juice. Half water and half milk or stock may be used instead of all milk, and a spoonful or two of cream added just at the last is an improvement. If a

Cheese Sauce

is required add a piled-up tablespoonful of finely-grated cheese, stirring it in well so that it shall be smooth.

Corn au Gratin with Tomato Sauce

Prepare as before, using tomato sauce instead of white sauce.

Tomato Sauce

Take 6 small tomatoes, slice them and place in a pan with 1 oz. of butter, salt and pepper, and 1 pint of stock and water, or milk and water. Boil until soft, sieve, and thicken with 1 oz. of white roux (flour and butter cooked until smooth, as described in “White Sauce”). Stir until smooth and very hot.

Corn Fritters

½ tin of corn, 2 eggs, 2 tablespoonsful of flour, 1 tablespoonful finely-chopped parsley, seasoning to taste. Drain the corn into a bowl; stir in the flour carefully, add the parsley, season, and lastly, well beat the eggs, and stir those in. Have ready some boiling fat in a frying-pan, into which the batter should be dropped in dessertspoonsful. Drain on kitchen paper, and serve at once on a hot dish.

Corn Rissoles.

Take the cooked corn and beat it in white, cheese, or tomato sauce, and then leave until cold. Form into rissoles, egg and crumb and fry. Serve very hot, garnished with fried parsley.

Omelette with Corn

Prepare the omelette as usual, and have ready some corn heated in white sauce. Just before serving the omelette spread the inner portion with the hot corn.

Curried Corn.

Prepare the corn as before, and heat in a good curry sauce. Pile in the centre of a hot dish and surround with boiled rice garnished with sieved yolk of egg.

Curry Sauce

Slice an onion and ½ a small apple finely, and fry them in 2 oz. of clarified dripping or butter. Stir in ½ a dessertspoonful of curry powder and the same of flour. Salt to taste. Add ¼ pint of stock or milk, cook gently for 30 minutes, then put all through a sieve, add a few drops of lemon juice, and reheat.

“Humitas”

(_A Chili dish_)

Grate some fresh green corn, add a little sugar and red pepper.

Fry this slightly in clarified dripping. Arrange two leaves from the sugar-corn, the broad part lapping over the other. Fill this with about a tablespoonful of the mixture, then fold it up neatly in the leaves, tying it with a thin strip from another, and bake.

When the fresh corn is not in season, the corn in tins will answer the same purpose if cooked and passed through a wire sieve and wrapped in vine leaves.

Corn and Cheese Cream

Cook the corn, mix it into the cheese cream, and serve very hot on buttered toast. For the Cheese Cream _see_ page 71.

The serving of these recipes may be varied: for instance, instead of sending corn au gratin to table in one large dish, bake and serve it in small brown or green earthen pipkins, one to each person, or in the centre of a croûton of fried bread.

It is worth noting, too, that haricot beans may be substituted for corn in any of these recipes. They should be soaked for 2 to 4 hours, and then boiled in stock or water for 3 hours.

Haricot Beans

Haricot beans must be soaked for quite 12 hours in cold water, then put into a pan with cold water slightly salted, (½ oz. of salt to 1 gallon of water,) brought slowly to the boil, then drawn aside and simmered for about 2 hours.

Haricot Beans à la Milanaise (Hot)

Boil the beans as directed and serve with a covering of sauce à la Milanaise, which should be made in the following manner: Scald 4 onions for 5 minutes in boiling water, then dry them and cut them up, place them in a saucepan with a pinch of sugar, 1 oz. of butter, and a saltspoonful of salt. Boil a tablespoonful of rice, and when cooked add it to the onion; moisten with ½ pint of milk or water, cook slowly, stirring occasionally; when the onions are soft add 1 tablespoonful of finely-grated cheese. Mix well and pass through a sieve, add to this ½ pint of white sauce, mix thoroughly, repeat and pour over the beans.

Haricot Beans with Tomato Purée

Cook the beans as before and serve covered with tomato purée (_see_ page 18.)

Haricot Beans with Soubise (Onion) Sauce

Cook the haricots as before and serve with onion sauce poured over and croûtons of fried bread arranged round.

Soubise Sauce

Take 2 large onions, peel them and put them in boiling water for 5 minutes. Strain, slice, and place in a pan with 1 oz. of clarified dripping and stew until tender. Lift the pan from the fire and stir in ½ pint of melted butter sauce. Let it boil, stir for about 7 to 10 minutes, and then rub through a hair sieve.

Lentils

Soak the lentils for at least 12 hours in cold water. Then drain and place them in a pan with cold salted water (1 gallon of water to ½ oz. of salt), bring them to the boil, then draw aside the pan and simmer, until the lentils are quite soft, about 1 hour. After having been cooked like this they can be served in any of the methods advised, for haricot beans or plain, save for the addition of a pat of butter melting among them, a sprinkling of chopped parsley, and a shake of pepper and salt.

Lentils with Curry Sauce

Cook the lentils as before and serve with plenty of curried sauce poured over. For the curry sauce _see_ page 45.

Maigre Soufflés

There is no nicer way of serving such vegetables as cabbage, spinach, artichokes, or celery, than in the form of a soufflé, which may appear as an entrée or second course dish, or as a vegetable to accompany meat or poultry.

Savoury soufflés of rice and of macaroni are also delicious, and although all soufflés require care in the cooking, a cook of moderate abilities will soon master the art of making these delicious dishes.

Vegetable Soufflé

Have ready about ½ lb. of any carefully made and well-flavoured vegetable purée--spinach, cabbage, turnip tops, Brussels-sprouts, carrot, turnip (or both mixed) artichoke, tomato, or celery. Then put 1 gill of water and 1 oz. of butter into a pan with a pinch of salt. Directly this comes to the boil, stir in 1 oz. of flour, stirring it well with a wooden spoon for 2 or 3 minutes, put in the purée, and just remove the pan for a little, add the yolks of 2 eggs, 1 at a time, and 1 whole egg, and finally the whites of 2 eggs beaten to a stiff froth. Have ready a papered soufflé dish, fill it three-quarters of the way up, bake in a hot oven for 10 minutes, and serve at once, first removing the paper and wiping the dish.

The purée may be prepared at any time, but the eggs should only be added just before the soufflé is to be baked. The dish (china or tin) in which the soufflé is baked must be well greased and a greased paper tied round. The mixture rises so strenuously that if the dish is 3 parts full (and it should be to look well when served), the paper is required to prevent the mixture from falling over, as it rises just above the edges of the dish. When baking the soufflé do not bang the oven door, and open it very gently, and, by degrees when taking the soufflé out. If kept waiting the soufflé will fall and become tough. So with these dishes the diners must wait for the soufflé rather than the soufflé for the diners.

Vegetable Purée

This is merely the vegetable boiled in water or stock, and then put through a sieve so that it forms a preparation resembling a very thick custard. Spinach à la crême (page 20) and purée of watercress, lettuce, and turnip tops (pages 16 and 17) are excellent foundations for soufflés. Such vegetables as artichokes and celery should be treated as follows:--

Celery Soufflé (Hot)

Wash some celery well, and remove all the outside parts, cut up ½ lb., put it on in cold, salted water, bring this to the boil, take out the celery and drain. Put the celery into a pan with 1½ gills of milk, half a bayleaf, a blade of mace, a slice of onion, and boil it all till tender, then sieve the celery, and it is ready for the soufflé.

Savoury Rice Soufflé

Wash 2 oz. of rice and then place it in ¾ of a pint of boiling stock (fish or vegetable stock), and cook until the rice swells and is soft without being pulpy. Drain it and let it cool, and then stir into it 1 oz. of fresh butter, 2 or 3 tablespoonsful of tomato purée, salt and pepper the beaten yolks of 2 eggs and then the frothed whites. Bake in a soufflé dish prepared as already described.

Mushroom and Rice Soufflé

Proceed as before, but use stewed mushrooms instead of the tomato purée.

Rice and Cheese Soufflé

Proceed exactly as for Savoury Rice Soufflé but add 2 oz. of grated cheese.

Macaroni Soufflé

Proceed as for Rice Soufflé, using about the same bulk of cooked macaroni (cut into half inch lengths) as of cooked rice.

CHAPTER IV

DISHES MADE WITH MACARONI AND SPAGHETTI

Macaroni and Spaghetti

To Boil.--Macaroni or spaghetti should be boiled in the same way as rice, namely, thrown into boiling salted water, and should never under any circumstances be soaked or placed in cold water previously. They should be tested occasionally with a fork, and when tender a teacupful of cold water should be thrown into the pan to stop the boiling, the pan should then be lifted from the fire, the macaroni or spaghetti drained of all liquid and returned to the hot dry pan and kept hot until wanted. The time for boiling is from 20 to 30 minutes. The following dishes can be made of either preparation:--

Macaroni à la Napolitaine (Hot)

Boil 3 oz. of macaroni in the manner described above, and after it has been returned to the pan in which it was boiled, stir into it 2 oz. of Parmesan cheese finely grated and 1 oz. of butter. The cheese should be stirred in half at a time and well shaken amongst the macaroni. Season with black pepper and salt and serve at once very hot.

Macaroni à la Italienne (Hot)

Follow the preceding recipe for boiling the macaroni, and having returned it to the pan, stir into it 1 oz. of cheese finely grated, 1 oz. of butter, and then ½ pint of tomato purée (_see_ page 18). Mix well and serve very hot piled on a dish.

Macaroni au Gratin (Hot)

Boil the macaroni by the directions given above, then mix into it 1 oz. of grated cheese and 1 oz. of butter, stir well and place the mixture neatly in a fireproof dish, sprinkle over it ½ oz. of grated cheese and the same amount of dried breadcrumbs. Melt ½ oz. of butter and pour it over the whole. Place in the oven (until a light brown colour) for 10 minutes, then serve.

Macaroni Cheese (Hot)

Butter a fireproof dish and in it place 3 oz. of macaroni previously boiled, dust it with pepper and salt. Make a good white sauce and add to it 2 oz. of grated cheese. Pour this all over the macaroni and sprinkle the top with grated cheese and a few dried breadcrumbs. Place in the oven and cook until a golden brown and serve in the dish in which it is cooked.

Macaroni au Jus (made with Meat Stock) (Hot)

Boil 3 oz. of macaroni for 10 minutes, drain off the water and pour into the pan ½ to ¾ pint of brown stock, simmer the macaroni until tender, pour off the stock; but should the macaroni have absorbed it all, take enough to moisten the whole, thicken it in the usual way, and add browning to colour it. Place the macaroni on a hot dish--it should be kept hot in the pan while the sauce is making; pour the gravy over it and serve.

Buttered Macaroni (Hot)

Boil 2 oz. of macaroni and drain it well. Put 2 oz. of butter into a thoroughly warmed pie dish, put the macaroni on top of this, and mix it all well together with two forks, sprinkling in at the same time freshly-grated cheese and coralline pepper. When thoroughly mixed and the butter all absorbed, sprinkle it with more pepper and cheese, and serve at once.

Poached Eggs and Macaroni (Hot)

Break some macaroni up into inch pieces, rinse it well; put 2 oz. of butter into a fireproof dish, put the macaroni in, and pour enough milk over it to thoroughly cover it, stirring it now and again. When three-quarters cooked, lift it out, and put it into another dish, seasoning it well with pepper and salt, and pour over it ½ pint of good brown gravy, then put it back in the oven again and leave it till cooked. When ready lay some poached eggs on it, sprinkle liberally with Parmesan cheese, coralline pepper, and serve.

Macaroni Cutlets (Hot)

4 oz. macaroni, 4 oz. grated cheese, 1 oz. flour, ½ oz. flour, ½ pint of milk, 1 teaspoonful French mustard, breadcrumbs, 1 egg, cayenne and salt. Boil the macaroni in water until it is quite tender, then cut it into pieces of half an inch in length. Melt the butter in a stewpan, add the flour gradually, stirring until there are no lumps, add the milk and stir over the fire until the sauce thickens. Mix the macaroni, cheese, mustard, pinch of cayenne and salt to taste, with the sauce, then turn out on to a plate and leave until cold. Form into cutlets or small rolls, roll in breadcrumbs, then dip in beaten egg, and again roll in crumbs. Fry the cutlets in boiling fat until they are a golden brown colour, then serve with a garnish of fried parsley. If the mixture is formed into cutlet shape place a small piece of raw macaroni at the thin end to represent the bone.

Fish and Macaroni (Hot)

Cook the macaroni until quite tender, then cut it into small pieces; meanwhile flake ½ lb. of cooked fish, free from shin and bones, and make a good stock from the bones and trimmings of the fish. Melt 1 oz. of butter, stir into this ½ oz. of flour, strain in ½ pint of the fish stock, and bring it all to the boil; then put in the fish and macaroni, season to taste with salt and pepper, turn into a buttered fireproof dish, and bake in the oven for 10 minutes.

Macaroni with Tomatoes

Remove the stalks of the tomatoes, cut each one into four pieces, then put them into a saucepan with a little water, a bayleaf, and a sprig of basil, and season with pepper and salt to taste; now boil till thoroughly done, when you turn them out on to a hair sieve, allowing them to stand for a minute or so, in order that all the water may drain off and be thrown away; then pass the tomatoes through a sieve with a wooden spoon, heat up the pulp well with a good lump of butter, and then dress the previously-boiled macaroni with this, and plenty of grated Parmesan, or any good, strongly flavoured cheese which will grate well.

Italian Cake (Hot) (made with Suet)

Boil 2 oz. of macaroni till tender, drain well and cut into small pieces, then pound it with 2 eggs, 8 oz. of grated Parmesan cheese, 4 oz. mutton suet, and season to taste with pepper and salt; steam in a basin or mould for 70 minutes. Turn out and serve with tomato or any other savoury sauce to taste. 2 beaten yolks of egg may be substituted for the suet.

Spaghetti Pudding (Hot)

Cook 4 oz. of spaghetti as previously directed, drain it and place half of it in a pie dish, grate 2 oz. of cheese (a good cooking one should be chosen), and sprinkle some of it over the spaghetti, slice 4 or 5 small tomatoes and place them on the bed of macaroni, sprinkling them with cheese, pepper and salt, and finish with the remainder of the macaroni, placing the rest of the cheese on the top. Pour carefully over this ½ pint of milk and cover the dish with a plate or small dish, cook in a moderate oven. A fireproof dish with a fitting cover would be useful for this dish, but if not procurable a pie dish can quite well be used.

Baked Tomatoes and Macaroni (Hot)

Cut 4 or 5 tomatoes of the same size into halves and place them in a baking-tin with a small piece of butter on each and dust them with black pepper and nutmeg. Bake from 15 to 20 minutes. Have ready 6 oz. of macaroni boiled and hot, place this in a circle on a hot dish, arrange the tomatoes inside this and pour over the spaghetti a rich cheese sauce. Serve very hot.

Spaghetti à l'Indienne (Hot)

Make a curry sauce by slicing 2 small onions and frying them in butter until a light brown, add to them 2 teaspoonsful of curry powder and a tablespoonful of lemon juice or rather less of vinegar, a tablespoonful of sugar, a pinch of salt and two raw apples chopped very finely, stir in 1½ pints of water and simmer until the ingredients have become a pulp. Place ½ lb. of spaghetti in boiling water, and when partly cooked remove it, drain, and finish cooking it in the sauce. Serve very hot.

CHAPTER V

DISHES MADE WITH RICE

Rice

To Boil.--Place the rice in a pan of fast boiling water and be careful to choose one large enough for it. 1 to 1½ oz. of rice should be cooked in a quart pan, which should be three-parts full of water, and have ½ a teaspoonful of salt and a few drops of lemon juice in it, the latter to preserve the whiteness of the rice. Stir occasionally. Boil the rice for 10 to 15 minutes, but test it at the former time by pressing it between the finger and thumb. When the grains feel soft remove the saucepan from the fire at once and drain off the water; return the rice to the pan and set it on the corner of the stove to dry, shaking it occasionally. Some grains of rice will always stick to the pan, and to remove these put a small pat of butter in the pan, and as this melts the grains will fall away. The rice will take quite 10 minutes to dry and should never be served until the moisture has been got rid of and the grains separated. Remember always that rice swells very much in the cooking process, hence the necessity of the large pan and amount of water required. Carolina rice swells more than Patna and so requires rather more water than the latter. If the rice is boiled too slowly or for too long a time the result will be a sticky mass. A good plan is to pour in a pint of cold water when the rice is sufficiently cooked. This stops the boiling at once and helps to separate the grains; if put close to the stove when the rice is first put into the pan, the cook will be able to throw it into the pan the moment the rice is tender. If the rice is to be served with meat in place of a vegetable, the rice should only be partly cooked and the water all drained off, and then ½ pint to 1 pint of stock put in the pan. This should be simmered until quite cooked, drained and served.

Another method of boiling rice, though totally different to the foregoing, is equally successful. Place the rice in cold water and allow it to come to the boil. After boiling for a few minutes and when the grains are tender when pressed between the finger and thumb, throw in a jugful of cold water, remove the pan from the fire, and pour both rice and water on to a wire sieve, shake well, and when the water has run away sufficiently, place the sieve with the rice upon it in the oven to thoroughly dry it. The grains will fall away from each other and the rice is ready for use.

Rice is even better as a vegetable if it is cooked some time before being wanted, covered over, and reheated in the oven before use; the grains are drier than when only cooked and served at once.

Fried Rice

Served as a vegetable

Boil ½ lb. of rice as directed, and when it is thoroughly dried fry it in 1 oz. of butter until slightly browned. Dust with pepper and salt and serve piled in a dish.

Devilled Rice

Proceed as for Fried Rice, but mix in a pinch of curry powder with the hot liquid butter.

Rice à l'Italienne (Hot)

Boil the rice in the manner described on page 60, and to 4 oz. when cooked and drained, stir in 1 oz. of butter, dust with salt and pepper and stir well, mixing thoroughly; add sufficient tomato sauce to moisten the whole, and add 2 oz. of finely-grated cheese. Mix well and serve very hot.

Risotto à la Milanaise (Hot)

Fry 3 oz. of chopped onion in 2 oz. of butter or clarified dripping until of a golden brown colour, then add 6 oz. of rice, stir without stopping for 2 or 3 minutes, add by degrees 1 pint of stock, stir occasionally and simmer gently until the rice is just soft, add a very small amount of grated nutmeg and 1½ oz. of grated cheese before the rice is cooked; after this stir and cook for 3 or 4 minutes until the rice is quite soft. Take off the pan, add a small pat of butter, stir well and serve very hot.

Risotto, No. 1 (Hot)

Place in a saucepan ½ pint of milk, a small teacupful of raw rice, 4 small Portugal onions, 6 good-sized tomatoes, these latter ingredients chopped finely, pepper and salt to taste. Boil all together until soft, stirring occasionally, and just before serving stir in 1½ oz. of finely-grated cheese.

Risotto, No. 2, made with Stock (Hot)

Chop half an onion very finely and fry it in ½ oz. of butter. Place 4 oz. of rice in a saucepan with ½ pint of stock, add the onion and cook until the stock is absorbed. Stir in 1 oz. of grated Parmesan cheese, pepper and salt to taste. Make very hot and serve.

Stewed Rice and Cabbage, made with Stock (Hot)

Boil in the ordinary way separately equal quantities of rice and cabbage. The latter cut into small pieces before they are quite cooked, remove them from their respective pans and place them together in a stewpan with just as much stock as will cover them, simmer until quite cooked (probable time, 5 minutes), and serve with a covering of grated cheese.

Rice Savoury (Hot)

Boil 3 oz. of rice in ½ pint of milk, season with pepper and salt; butter a pie dish, lay in a layer of rice, sprinkle this with 1 oz. of grated cheese, add the rest of the rice, sprinkle with another ounce of cheese, dot some small pieces of butter all over the top; bake in a quick oven till nicely browned on the top.

Rice Balls (Hot)

Boil 4 oz. of rice in cold water, taking care to let it absorb all the liquid; to this add 1 tablespoonful of finely-grated cheese, 1 teaspoonful of chopped parsley, 1 oz. of finely-grated brown breadcrumbs, 1 tablespoonful of tomato sauce, pepper and salt to taste; bind all the ingredients with the yolks of 2 eggs, mixing thoroughly, form into balls, brush over with white of egg, roll in breadcrumbs and fry a golden brown.

Rice and Fish Toast (Hot)

Fry an onion, finely-sliced, in butter with a few shrimps or pieces of lobster, stir into it 1 dessertspoonful of mustard. When thoroughly hot, add a teacupful of rice previously boiled and dried and a tablespoonful of grated Parmesan cheese. Stir and serve very hot on rounds of buttered toast or fried croûtons.

Savoury Rice Pudding (Hot)

Simmer 2 tablespoonsful of rice in 1 pint of milk until nearly cooked, then add 1 oz. of finely-grated cheese, ½ oz. of butter, 1 teaspoonful of made mustard, a pinch of salt and a dust of cayenne pepper. Mix all together and pour into a buttered pie dish, sprinkle ½ oz. of finely-grated cheese on the top and bake in a moderate oven for ½ hour.

CHAPTER VI

CHEESE DISHES

Welsh Rarebit (Hot)

Note.--As a general rule where Parmesan cheese is mentioned, any well-dried and finely-grated cheese serves the purpose.

Slice down some good, rich cheese rather thinly, into a delicately clean stewpan, with some morsels of butter, and 2 or 3 spoonsful of porter, good ale, or new milk as you please, according to the quantity of the cheese; flavour to taste with freshly-ground black pepper and English mustard. Stir it all till thoroughly melted, pour it over hot buttered toast, browning the surface if you like with a hot shovel, and serve at once.

This requires careful watching, because if it be in the least over-cooked it will be leathery.

Irish Rarebit (Hot)

Add a few drops of vinegar and a finely-minced pickled gherkin to cheese treated as above, and serve very hot.

Baked Cheese Sandwiches (Hot)

Cut some slices of good, rich cheese about a third of an inch thick, season lightly with freshly-ground black pepper, and a drop or two of tarragon vinegar; then place them between two slices of brown bread and butter; trim these neatly, and set them in the oven, serving them directly the bread is toasted.

Parmesan Puffs (Hot)

Mix 4½ oz. of breadcrumbs, 4 oz. of Parmesan cheese, 2 oz. of butter, ½ a teaspoonful of cayenne pepper and salt, and 2 eggs; pound these all thoroughly in a mortar, bind them with a well-beaten egg, shape into balls about the size of a walnut, egg and breadcrumb them, and fry a golden brown in plenty of boiling fat. Drain well, and serve at once very hot, garnished with parsley.

Parmesan Eggs (Hot)

Take a flat fireproof dish and put into it the yolks of 2 eggs, a small pat of butter, some spice, and a tablespoonful of finely-grated Parmesan cheese. Stir over the stove. Then break into it five or six eggs and sprinkle the whole with grated cheese. Brown and serve.

Cheese Balls (Hot)

Put 1 pint of water into a pan with 1 oz. of butter when quite hot, dredge in 4 oz. of flour, and pepper and salt to taste, draw to one side and when cooled a little add the yolks of 4 eggs and 4 oz. of grated cheese. Have ready a pan of boiling fat, take the mixture up in tablespoonsful, drop in and fry a golden brown. Serve very hot.

Cheese Butterflies (Cold)

Take 2 oz. of flour, 1½ oz. of Parmesan cheese, 1 oz. of butter and the yolk of 1 egg. Make a pastry of the above ingredients and roll out thin. Then with a crinkled round cutter cut out double the number of rounds you require to use and bake a light brown. Allow them to become cold. Mix some grated cheese with a little whipped cream to a nice thick consistency, season with salt and cayenne pepper, pile lightly on the rounds of pastry. (Some of the rounds must be cut into halves _before baking_ to provide the wings for the butterflies.) Dip the crinkled edges of the halves into carmine to colour them, and arrange them as wings on the rounds of pastry. Put a piece of stalk of parsley to form each antennae; also arrange or ornament the back of each butterfly with a little of the green leaf of the parsley.

Cheese Pudding (Hot)

Place 1 pint of milk in a saucepan and let it become hot, then pour it on to 1 tablespoonful of ground rice previously mixed with a little cold milk, return to the pan and stir until the mixture thickens. Remove the pan from the fire and add 4 oz. of finely-grated

cheese, a pinch of salt and cayenne, the yolks of 2 eggs, and 2 oz. of butter. Mix all well together and then add the beaten whites of the eggs. Butter a pie dish and pour the mixture into it, and bake in a moderate oven for 20 minutes. Sprinkle grated cheese over the top before serving.

Cheese Aigrettes (Hot)

Place 1 oz. of butter in a pan with ½ pint of water; when boiling add 3 oz. of flour. Stir over the fire until the mixture leaves the sides of the pan quite clean. Remove the pan from the fire and when slightly cool add the yolks of 3 eggs and the whites of 2, cayenne and salt to taste. Stir in 2 oz. of grated Parmesan cheese, and place the mixture on a plate to cool. Take a small piece of the mixture in a spoon and drop it in hot fat and fry a golden brown; continue this until it is used up. Serve on a dish paper garnished with parsley and sprinkled with grated cheese.

Cheese Patties (Hot)

Line some patty pans with puff pastry and fill them three-parts full with the following mixture. Place 2 oz. of finely-grated breadcrumbs in a basin and mix into them 1 raw egg and a tablespoonful of milk; then add 2 tablespoonsful of finely-grated cheese and 2 teaspoonsful of butter, 1 teaspoonful of made mustard, ½ a teaspoonful of salt and the same of pepper. Mix very well. Place the patties in the oven and bake until a pale brown. The mixture will swell slightly in baking. Serve very hot.

Cheese Mushrooms (Hot)

Take ½ lb. of rich toasting cheese, slice it, place it on a soup plate. Cover it with flap mushrooms--on each mushroom a nut of butter and a dust of pepper and salt. Cover with another soup plate and bake in a moderate oven for half an hour. Dish up on buttered toast.

Cheese Custard Pudding (Hot or Cold)

Put 2 oz. of finely-grated cheese into a basin and add to it 2 well-beaten eggs and ¾ pint of milk. Trim the edge of a pie dish with cheese pastry and pour in the mixture. Place 2 or 3 pieces of butter on the top and bake in a quick oven (400 deg.) for 20 minutes.

Cheese Croûtons (Hot)

Take 6 rounds of bread ¾ inch thick and about the size of a five shilling piece, fry them a golden brown colour, sprinkle over them a dust of dry mustard, a layer of grated cheese, salt and pepper to taste. Place them in a quick oven until the cheese is cooked, then place a spoonful of hot rice on each, garnish with capers and serve very hot.

Cheese Canapés (Cold)

Grate 2 oz. of cheese and mix it smoothly in a basin with a dessertspoonful of mustard, the same of anchovy sauce, a shake of cayenne, a pinch of salt, a dessertspoonful of anchovy vinegar, a tablespoonful of fresh butter and the yolks of 2 hard-boiled eggs. Mix this until it is a smooth paste, then spread it on rounds of buttered white or brown bread. Chop the whites of the eggs finely or press them through a sieve on to the paste. Serve cold.

Little Cheese Custards (Hot)

Grate finely 3½ oz. of cheese and mix it with 1 egg, add ¼ pint of boiling milk, pour the mixture into small fireproof dishes and bake for 10 to 15 minutes. Serve hot in the dishes.

Cheese Patties (Hot)

Line the required number of patty pans with puff pastry. Boil 1 oz. of macaroni in just as much water as it will absorb. When soft cut it into tiny pieces, mix with it 1 oz. of finely-grated cheese, a pinch of salt, a pinch of cayenne, and bind the mixture with a little cream or cheese sauce. Bake for 10 minutes.

Tomato Cheese Croûtons (Hot)

Stew ½ lb. of tomatoes in butter until tender with onion cut up finely, put them through a sieve, adding a small quantity of cream, or milk if the former is not procurable. Replace the tomato in the pan and add to it enough grated cheese to make it like a thick cream, season with pepper and place a little of the mixture in croûtons of fried bread. Serve very hot.

Cream of Cheese

Make some squares of hot buttered toast, place on a hot dish and keep hot. Melt ½ lb. of cheese in a little saucepan with 1 oz. of butter and 3 tablespoonsful of cream (or milk), pepper and salt. When of the consistency of very thick custard pour it over the toast and serve.

For the following Cheese Dishes, _see 10s. a Head for House Books_:--

Cheese Balls, Biscuits (hot or cold), Creams, Croûstades, Croûtons, Egg Toast, Pastry, Pudding, Ramekins, Straws.

The Single-Handed Cook:--

Cheese and Potato Fritters, Cream Croûtons, Cream Tartlets, Custard, Fingers, Pufflets, Quenelles, Soufflé, Tartlets, Zephyrs.

CHAPTER VII

OMELETTES AND CURRIES

Omelette

Break two eggs into a basin, season with salt, pepper, minced parsley, and chives, etc., and beat these all together for about 1 minute. Melt 1 oz. of butter in an absolutely clean pan (it is best to keep a pan on purpose for omelettes), and when this smokes, pour in the eggs, and do not touch them for a few seconds, till the liquid has set a little at the bottom of the pan; tilt the pan a trifle to one side, and if there is a small puff of steam, lift the edge up carefully with a knife to allow as much of the liquid as possible to run underneath; repeat this till there is no more egg liquid left, and the top just set, slip a knife under the omelette, fold it over, and slip it at once on to a hot dish, and serve immediately. This can be varied, of course, to any extent, by, just before folding it over, slipping in any kind of vegetable mixture, such as mushrooms, chopped up and previously lightly fried in a little butter.

Potato Omelette

To 4 eggs add 2 tablespoonsful of very smoothly mashed potato, add a tablespoonful of cream, a small piece of butter, pepper and salt, whip all together and then fry as before.

Green Pea Omelette

Place between the omelette a few green peas, made very hot, and tossed in butter, salt and pepper.

Asparagus Omelette

Fold the omelette over a few cooked asparagus tops, which have been made hot.

Tomato Omelette

Make an ordinary omelette, and before serving pour this mixture into it. Take two or three tomatoes and cut them into pieces, cut an onion into very thin slices, melt a tablespoonful of butter into a saucepan and place the onion in it. Cook them, but do not brown, add pepper, salt and the pieces of tomato. Stir all together for 10 minutes, take out the mixture, pass it through a sieve, and return to the pan, thoroughly reheat and it is ready for use.

Cheese Omelette

Add an heaped-up tablespoonful of grated cheese to the ordinary omelette mixture, sprinkling some over it just before serving.

French Bean Omelette

Heat some cooked French beans in butter and place them between a plain omelette.

Recipes for omelette made with flour, anchovy, cheese, mushroom, and sardine omelettes will be found in _Savouries Simplified_, by Mrs. C. S. Peel.

Some Maigre Curries

There are, of course, many varieties of curry. The recipe for one of worth is given in my _10s. a Head Cookery Book_, and I here add another, but before giving detailed recipes let us deal with the broad rules for curry making, the most important of all being--

Do not attempt to make curry in a hurry.

2 hours is the least in which you can make a vegetable curry worthy of the name, and it is far wiser to allow 3 or 4 hours.

Do not ask your cook to make curry on a day when she is very busy with other matters, for it will take an hour or more of undivided attention as well as a certain amount of attention throughout the time of cooking.

There is, however, no reason that curry should not be made the day before it is wanted, for it improves by keeping, and by being reheated.

A Delicious Vegetable Curry

Weigh 5 oz. of butter (or if economy must be studied, 3 oz. of clarified dripping, and 2 oz. of butter). Choose four medium-sized onions, and chop them very fine. Melt the butter in a stewpan and add the onions and cook them until they are of a deep golden brown, stirring often. Meanwhile, put 1 tablespoonful of curry powder in a saucer in the oven for 10 minutes, then mix it to a smooth paste with a little cream, or if this cannot be allowed, some milk, and add it to the onion mixture, and stir well. Cook slowly, stirring frequently for 2 hours in all. During this time the onions will become quite pulpy, and the butter like oil, and the colour of the mixture will slowly deepen to a rich mustard yellow. While this “ghee,” as it is called, is cooking, take 1 small vegetable marrow, cut in squares; ½ lb. of French beans, strung and broken in half; 2 large tomatoes, quartered; ½ a small cucumber, peeled and sliced; 1 small apple, peeled and cored and sliced; ½ a small carrot, sliced. Boil the vegetables as usual, cooking the larger and firmer longer than those of a more delicate kind. Make the curry mixture given above, and add the vegetables during the last ½ hour of cooking. Serve with a border of rice.

This recipe does not make a sloppy curry, but one in which the solid ingredients are coated with the thick sauce.

Other dishes, not properly curries though flavoured with curry powder, are often termed curry. They provide a quick and easy method of serving various materials. For these a curry sauce is needed.

Curry Sauce

Chop an onion and a few slices of apple finely and fry them in 2 oz. of clarified dripping or butter. Stir in ½ a dessertspoonful of curry powder and the same of flour. Salt to taste. Add ¼ pint of stock or milk, cook gently for 30 minutes, then put all through a sieve, add a few drops of lemon juice, and reheat.

Curried Cabbage

Take all the outer leaves off a young cabbage and boil it until it is half cooked. Drain it and chop it finely, place it in a pan with some curry sauce and simmer it gently for 1 hour. Serve in a border of boiled rice.

Curried Potatoes

Slice some hot boiled potatoes and pour over them a curry sauce.

Curried Macaroni

Boil the quantity of macaroni required until tender, drain it and cut it into pieces 1 inch in length. Place it in the curry sauce already described for 10 minutes, and serve in a rice border.

Lentil Curry

Take the cooked lentils (_see_ page 47) and heat them in curry sauce. Serve very hot in a border of rice.

Haricot Bean Curry

Proceed as for Lentil Curry.

CHAPTER VIII

SALADS

The English salad is not as a rule a success, and undoubtedly the chief fault in its making lies in the inferior quality of the oil used.

Provided with good oil the next point of importance in a green salad is the condition of the material. If the lettuces, endive, cress or watercress are faded the salad is ruined. The lettuce, etc., should of course be freshly cut, if possible, but where this is not feasible it should be chosen with care, and at once put into water--not soused into a basin, but placed with its root only in water--as if it were a flower--in a cool place. In this way a lettuce will keep in perfect condition for two or three days, if needs be. Cress and endive should be treated likewise. Let us now consider the making of

French Salad

Choose crisp lettuces, cut off the stalk and remove the outer leaves (when well washed these may be used for lettuce purée), tear the lettuce in pieces (on no account cut it), and wash it in a bowl of cold water. Place it in a clean cloth and swing it round until dry. This method of drying by centrifugal force gets rid of the moisture and does not bruise the lettuce.

Now rub the salad bowl very thoroughly with a slice of onion, and if the flavour is liked place half a small peeled onion in the centre of the bowl. Mix in the bowl 1 dessertspoonful of the best wine vinegar and 2 tablespoonsful of oil, and add a little salt and a good dusting of freshly-ground black pepper. Stir the lettuce round lightly in the mixture and serve. This quantity of oil and vinegar is sufficient for about 2 medium lettuces, but only experience teaches the exact quantity to use. The lettuce should not be swimming in the mixture: the leaves should merely be coated with it, and no remains of it should be left at the bottom of the bowl when the salad is mixed.

The chief faults of the average salad, next to the use of inferior oil and flabby lettuce, are the excess of dressing, the excess of vinegar, and the use of pepper which is not freshly ground. A salad prepared in the manner described is as different as chalk is from cheese from the salad which is generally put before one, and no more difficult to make. Salads of endive, corn, Batavian lettuce, or cress, should be made in just the same manner.

For orange salad and orange and cherry salad a similar dressing is used, and I notice how these fruit salads are growing in favour.

Orange Salad

simply consists of the sections of oranges free from pith and skin, string and pips, arranged in a bowl and dressed with oil and vinegar.

Orange and Cherry Salad

consists of glacé cherries arranged in the centre of the bowl surrounded by sections of oranges, and dressed with the same mixture.

Another excellent salad, not very generally known, consists of sliced apple and shred celery; it is known as

Apple and Celery Salad,

and is dressed with mayonnaise sauce, or with whipped cream flavoured with salt and pepper. This

Cream Dressing

is newer than mayonnaise, and is generally appreciated. Another delicious salad on which it is used is

Nut Salad

This is made of Brazil nuts broken into pieces, shred celery, and tiny dice of bread and butter. This salad is equally good if dressed with cream or with mayonnaise sauce.

As mayonnaise is generally spoiled by too overpowering a use of vinegar, I give here an excellent recipe in which the special oil and vinegar already mentioned are employed.

Good Mayonnaise Sauce

To make mayonnaise sauce, first rinse the basin in very cold water, and make the sauce in a cool place, if possible keeping the basin on ice while you mix the sauce. See that the oil is perfectly good, and add it drop by drop. This is important, otherwise the sauce may curdle. Use the very best vinegar, as a very little of this will suffice and prevent the sauce from becoming thin. Put the yolks of 2 raw eggs in a basin, and add to them a pinch of salt, ½ a saltspoonful of white pepper, and ½ a teaspoonful of French and English mustard in the dry state, and a tiny pinch of cayenne. Work these together, then stir in drop by drop 3 gills of olive oil. When quite thick add ½ a teaspoonful of lemon juice, and 2 dessertspoonsful of the best vinegar drop by drop, and set in a cool place, or on ice, until required. In case the sauce curdles the yolk of another egg must be beaten up, and the curdled sauce added to it little by little.

Oil and Vinegar Dressing

Mix 1 saltspoonful of salt and a good pinch of black pepper with 1 tablespoonful of tarragon vinegar. Stir until the salt has dissolved, then add drop by drop 3 tablespoonsful of olive oil.

The other dressings generally used are sauce tartare, salad dressing and sauce vinaigrette, for which I give the following excellent recipes:--

Sauce Tartare

Chop 1 shallot very fine, with ½ a tablespoonful of chervil, the same of tarragon, and 12 capers, also finely minced. Place these ingredients in a bowl and add ½ a teaspoonful of mustard powder (English), the yolks of 2 raw eggs, and drop by drop 1 teaspoonful of vinegar; then a pinch of salt and ■ the quantity of pepper. Pour in by degrees, stirring all the time, a teacupful of oil. If too thick add drop by drop a little more vinegar, and if too salt a little more mustard and oil.

Salad Dressing

Beat the hard-boiled yolk of 2 eggs with 1 teaspoonful of dry mustard. When smooth add by slow degrees 8 dessertspoonsful of oil, 5 of vinegar, 1½ of sugar, and ½ a teacupful of cream. Beat together with a silver spoon until smooth. If bottled this dressing will keep for some days.

Sauce Vinaigrette

Mince very finely 1 shallot, 2 good sprigs of parsley and the same quantity of chervil and chives. Place with them about 1 tablespoonful of salt, 1 teaspoonful of fresh black pepper and 3 tablespoonsful of vinegar. Stir well together, add by degrees, stirring all the time, 4 tablespoonsful of oil.

In salads where chives, onion or garlic are mentioned, it is best, unless the taste of those about to partake of the dish is known, to omit them, and either to rub the salad bowl with onion or garlic or to prepare what is called a chapon:--

Chapon

Cut a neat square of crust from a French loaf, sprinkle it with salt and rub it with raw onion or with a clove of garlic. Put this at the bottom of the salad bowl, place the salad on it and mix thoroughly. Serve immediately.

Vegetable Marrow Salad

Boil or steam the marrow, drain, and when cold cut into neat pieces, place in a salad bowl with a dressing of oil and vinegar.

Artichoke Salad

Boil the number of Japanese artichokes required for 5 minutes, and when cold place in a salad bowl with slices of cold boiled beetroot and celery. Cover with mayonnaise sauce. Garnish with beetroot and celery.

French Bean Salad

Boil the beans whole, drain them, and dry them on a cloth, when quite cold place them in a bowl and pour over them some salad oil, shake some black pepper over them and a small amount of salt, then drop over them a few drops of the best wine vinegar, and if liked a sprinkling of very finely-minced tarragon and chives.

Lettuce Stalk Salad

Take the stalks from lettuces running to seed, and tie them in bundles, cutting them more or less the same size. Place in a saucepan and boil until tender, 10 to 15 minutes. Take out and drain them, and allow them to get quite cold. Then cut up into slices of the same size, place in a salad bowl and cover with mayonnaise sauce.

Nut and Celery Salad

Crack some Brazil nuts and cut the kernels into 3 or 4 pieces. Take an equal quantity of crisp cleanly-washed and shred celery. Mix together and dress with mayonnaise sauce. Pile in the centre of the salad bowl and garnish with sliced tomato or beetroot.

Winter Salad

Scald and then boil one or two large onions till soft. When cold, slice the onion, mix it with shred celery and sliced beetroot. Dress with oil, vinegar, salt and pepper.

Walnut and Celery Salad,

which is simply ■ celery to ■ walnuts tossed in mayonnaise sauce.

Russian Salad, No. 1

Cut up some beetroot into shapes, add to this a little chopped celery, some turnip, carrot, potato, all cooked and cut into dice; pour some mayonnaise over it all, mix well, and garnish with bunches of cress. If liked, a French vinaigrette dressing may be used instead of the mayonnaise.

Russian Salad, No. 2

Cut in thin slices a few small cold steamed potatoes, 1 small beetroot boiled, 1 small carrot, a few cold peas or French beans, 1 little pickled cabbage, 1 sardine filleted and chopped fine. Mix all well together. Rub the salad bowl with onion. For the dressing take a teaspoonful each of raw mustard and salt, a little coralline pepper, a pinch of curry powder, ½ a wineglass of sherry and the same of Lucca oil. Mix all well together and pour over the salad.

Haricot Bean Salad

Soak the haricots for 6 or 8 hours and then boil them until tender. Leave until cold. Pile them in the centre of a salad bowl and surround with shred tomato or beetroot and some shred celery. Cover with whipped cream flavoured with salt and white pepper. If liked dip the haricot in oil and vinegar in addition to the cream. Decorate the cream with a little coralline pepper, and arrange the beetroot so that it makes a red border to the white pyramid of cream.

Salade d'Estrées

Take some cold boiled roots of celeriac, some cold potatoes and beetroot. In the middle of the salad bowl make a heap of endive and blanched celery stalks, frizzed, in short lengths. Surround with the vegetables sliced. Pour over the whole a good mayonnaise sauce.

Garnished Salad, with Imperial Mayonnaise

Pound and press through a sieve 4 large anchovies (no bones), boil 6 eggs hard, halve them and neatly remove the yolks, which pound to a paste with butter, the powdered anchovies, ¼ teaspoonful of mace, a little pepper. Mix well, and roughly fill the egg cases. Fill almost to the top the salad bowl with finely-shred lettuce, endive, cooked beetroot, sliced (very thin) artichoke (cooked), and finally add some cucumber ribbons. Then arrange with care the egg baskets and pour round, but not over the halved eggs, the following dressing (imperial mayonnaise):--Put into a basin ½ pint of aspic, and add 1 tablespoonful of olive oil, 2 teaspoonsful of vinegar, and a trifle of salt and pepper. Beat with an egg whisk until all the ingredients are well blended. Set the salad in a pan of ice water if possible, or in a very cold place until served.

Celery Salad

Wash some fresh crisp celery and use only the inner sticks. Cut it in ½ inch lengths, place in a salad bowl which has been rubbed with onion and dress with mayonnaise sauce. Decorate with a little chopped truffle.

Salade d'Asperges à la d'Aumale

This is a way of using cold cooked asparagus with mousseline sauce. Put ½ gill of new milk into a pan with the yolks of 4 eggs, and 3 crushed long peppercorns; place this all in a bainmarie, or larger stewpan, half filled with boiling water, and whisk it all together well for a few minutes; now add 1 oz. of butter, adding it bit by bit, and only putting in another piece when the first is thoroughly melted and worked in. Season it as you whisk with a dust of salt and nutmeg, and a tiny squeeze of lemon juice at the last. When it is finished this sauce should look like frothed cream.

Another salad which is suitable for hot weather is

Lettuce and Tomato Salad

For this proceed exactly as for a plain lettuce salad, but add a ring of fresh tomato, peeled, and not too thinly sliced.

Other nice salads are--

French Tomato Salad

Take 6 ripe, sound tomatoes, wipe them, and place them in boiling water for a minute; drain, peel, let them cool, quarter them (this should be done while they are in the salad bowl, so that the juice is not wasted); add a teaspoonful of finely-chopped chives or a chapon; dress with oil and vinegar.

Tomato and Egg Salad

Proceed as before, but to each tomato add ½ a hard-boiled egg, quartered, and dress with mayonnaise sauce.

For the following salads _see_

ANCIENT EGYPTIAN, ASSYRIAN, AND PERSIAN COSTUMES AND DECORATIONS.

By =Mary G. Houston= and =Florence S. Hornblower=.

Containing 25 full-page illustrations, sixteen of them in colour, and 60 line diagrams in the text.

Small crown quarto.

In this volume the history of Costume is traced from the earliest ages. The illustrations (which are taken chiefly from the British Museum) are given in facsimile from the drawings of the artists of the period, and, where the drawing is too primitive to be easily understood, a garment is also shown drawn in modern style; in addition, every type of garment illustrated is accompanied by a flat pattern showing the _cut_. Information of this special character on Ancient Costume is usually very difficult to obtain, and it is anticipated that the volume will be of first-rate importance to dress designers, to theatrical designers, and also to the schools in which historical costume and the history of the progress of the human race are subjects for study.

“_Go, little booke; God send thee good passage_”

TO MY MOTHER

NOTE

The Author’s thanks are due to the owners of the pieces of embroidery illustrated in this book who kindly lent them to her for reproduction:--Miss Beatrice Brooks, Miss Marion Boyd, Miss Janetta S. Gillespie, Miss Mary A. Gill, Miss Martha Stevenson, Miss Elspeth Stewart, Miss Jessie Gibson (students of the Glasgow School of Art); also to Miss Kay, Parkhurst, Cedars, Derby, for the loan of three pieces worked by her pupils.

FOREWORD

Now that many of our busy working people have better regulations as regards the hours of the day's work, there is great need to provide occupation for the day's leisure; and needlework, as a leisure craft, is one of the most refreshing and pleasant and profitable sources of entertainment--provided always, that those who undertake it realise that, with right thought and consideration on the part of every worker, each should become, as it were, a law unto herself, so that she should realise also that she need, under no circumstance, be the slave of old traditions, if she can give fitting reasons for making a change which is to the purpose of her work.

To be in a healthy and living state, our art should be constantly changing its fashion; if it stands still, it is retrograde, and for some few generations we may say this of British embroidery. What changes it has undergone are due almost entirely to the commercial enterprise of manufacturers of printed patterns--usually foreign ones. The importation became very considerable with the introduction of so-called Berlin woolwork, and since that period the British needlewoman has set aside her own ingenious arrangements and follows blindly where the merchant leads, and British design for needlework, as an expression of its people, is almost a dead thing.

Most people have a superstition that in knowledge of a multitude of stitches lies the whole mystery of needlework. This is emphatically not the case. There really is no mystery about stitches; they are but the letters of the needleworker's alphabet, and the words of her language--to be used according to her own ideas. One may embroider poems; another may embroider prayers and praises for her church; another may beautify a fair woman's garment or sing a little song in stitches for a baby's robe; yet another may be like a treatise on surgery, repairing and restoring that which has been damaged. But needlework does not exist for the stitches. It is the stitches which--as they are well or ill-used--express the worker, and, if she is a wise worker, she can find out for herself most of the stitches she needs. Nor is it necessary to be at great expense in needlework, indeed, for those who take it up as a recreative craft half the interest may lie in the fact that no material is too common or too homely to be made into something fitting and, therefore, beautiful--since the truest art is to make a thing pleasing to the eye and yet entirely suited to the purpose.

The commonest failing of the designers of this country is that they think that beauty lies in the elaboration of ornament, and this is why the fashions of British dressmakers fall short of those abroad. It is the little simple contrivances, that are almost no more than a sort of loving finish to the actual construction of a piece of work, that give the highest standard of style in garments: and the best training a needlewoman can have is to make her seams, hems, openings and fastenings of garments or household fitments things of beauty, while, at the same time, she considers the uses and purpose of her work. It is as a piece of engineering we should consider the construction of our household hangings and covers of our garments--planning that decoration should be coarse or fine, as fits the material, and taking thought also for the washing and wearing of it.

The fashions of to-day show a very marked tendency to decorative construction, due in great measure to a change in the needlework for school children introduced a few years ago. The tendency shows most interesting results, especially in the fact that the shaping of clothing has become very simple and that garments depend almost entirely on stitchery for their decoration, rather than on manufactured braids and trimmings; and the styles and shapes are infinitely less stereotyped, so that clothing for women tends to express more nearly the personality of the wearer than it has done for many generations.

The work of the hand--as apart from that of the machine--is more and more in demand, and decorative needlework, even in our shops, is becoming more to be desired, for unique and personal characteristics and expression, than it has been for a very long period. This being the case, let our needlewoman take courage and realise that in each mind there are possibilities of new ideas and new inventions--that all materials open up new opportunities, and that with little labour she may greatly enhance and beautify the things she works and find appreciative opening for her skill. Never was there such universal demand for handwork of every kind, and for such household fittings, which tend towards economy and labour saving in particular, the need is almost unlimited. Some of the most interesting embroideries done during the last few years have been planned and carried out in some of our Scottish schools by untrained workers--designs so simple that the workers do not realise that they are designing at all--since they draw largely with needle and thread alone, and have little assistance from chalk and other markings. And it is this type of work, usually sewn in coarse yarns and on rough canvas, flannel or homespun, that is perhaps the most happy and most stimulating for a designer of needlework to begin on. The work is so quickly achieved--so gallant and bright in colour--so utilitarian in purpose and of so little cost in outlay, that it is above all others to be recommended. It needs no experience in stitchery to work in bright wools, if the material is firm and strong, and the writer has pleasant experience of maid-servants and village wives in the north country making admirable rugs, garments, and other embroideries, which command good prices at the Artificers' Guilds and other places where a high artistic standard of design is required.

It is only by means of such counter attractions in stimulating leisure crafts, which pay their way as well as give pleasure to the workers, that we can contend with the spirit of restless excitement and craving for mere pleasure-giving that is so marked a sign of the early days of peace, and reconstruction can only come by countering this mischievous tendency in young people by giving them something that gives stimulus to their longing for brightness and yet does not unduly tax those whose days may be occupied in strenuous employment.

How desirable it is that such gatherings of women and girls as church sewing meetings, guilds and clubs, should take up such new ideas in needlework and apply for a competent instructor. How almost more desirable is it that men might realise the pleasure a needle can give if applied to bold construction and original work.

It is by no means universal over the world that needlework is a women's craft; in many countries it is done quite as much, if not more, by the men, and it is probable that if our men took up this craft, it would show a very marked tendency to individual and original expression.

The power of invention is so great and serious a factor, that it is almost too big a thing to touch upon here. We do not exaggerate its importance when we say that this faculty in human beings is what we can justly call the Holy Ghost, for it is that in us which comes, not of ourselves, but from direct inspiration, and the first principle of education ought to be to open our minds to it, in howsoever small and humble a fashion it comes, and to make clear the way for its development and growth towards greater things.

AN EMBROIDERY BOOK

CHAPTER I

INTRODUCTORY

“Give her of the fruit of her hands; and let her own works praise her in the gates.”

Needlework, as an artistic and practical craft, is highly interesting from a decorative point of view, and well within the scope of any intelligent worker. It has distinct advantages over most crafts--it neither requires great initial outlay for apparatus or materials, nor does it demand a special workshop; thus, as a domestic art, it commends itself to many of us on account of its adaptability to the conditions of life, as well as for its decorative value--as a means of adding grace and beauty to our daily surroundings.

During the thirteenth and fourteenth centuries England was famed for the beauty and magnificence of its ecclesiastical embroideries. These wonderful works found their way into many countries and were eagerly sought after by patrons of the beautiful; many pieces still exist, preserved in our museums, churches, or in private collections, to show us what extraordinary ability and invention these ancient embroiderers must have had. After the Reformation, when there was no longer the great demand for ecclesiastical work--embroiderers turned their attention to the decoration of garments to be worn by the wealthier classes. In the “Golden Days of Good Queen Bess,” and for some time later, all the ingenuity and skill formerly applied solely to church work was bestowed on the decoration and beautifying of personal clothing--dresses, cloaks, coats, waistcoats, caps, gloves, etc.; neither time, labour, nor expense was spared, the worker’s ideal evidently being to obtain the highest result of which he or she was capable. Some of the quaint pattern books of those days still exist, and they consist mostly of elements--dainty flower sprays, sprigs, fruits, birds, animals, fishes, border patterns and geometrical forms--all intended to assist the workers in the composition and building up of their designs and patterns.

In the busy world of nowadays, we cannot hope ever to attain to such perfection, nor to regain for embroidery the high position it once held in this country; but we still have many clever needlewomen who could produce beautiful work provided they had a better knowledge of how to set about it.

This book has been planned with the hope that it may be of use to many, and that it may create in both girls and women the desire to construct and decorate for themselves those simple articles of daily use which cost so much to buy and which can be made and embroidered, in simple patterns, with a little knowledge of construction and stitchery, at a moderate expenditure of time and money.

Perhaps the reason why so many workers buy their materials already stamped with a design, which often proves unsuitable to the purpose for which it is intended, and which gives small satisfaction when embroidered, is because of a certain distrust of themselves, a want of knowledge of their own powers of invention and ingenuity; or it may be a lack of energy and initiative, a reluctance to plan and create for themselves, due to the fact that they have never been taught to express their own ideas, but rather to depend on those of others. Nevertheless, the sense of beauty is, in a greater or less degree, common to us all. Why, therefore, should a needleworker not develop her own ideas rather than those of other workers? The designer, for example, who may have as little knowledge of stitchery as the needlewoman has of design, and who, therefore, cannot realise the labour involved in its execution, may lose much of his effect and may waste the time of the embroiderer. It is generally agreed that no two people have the same ideas; it is surely, then, of considerable importance that each one should at least make some attempt to express his or her own. If scope is given to the creative and inventive powers they, like other faculties, will grow in a most inspiriting manner; new ideas, inherent instincts, perhaps dormant hitherto, will spring up like flowers to encourage the beginner on the upward path, and as interest becomes keener and confidence grows, difficulties which at first appeared insurmountable will quietly disappear as the worker plans and thinks out a piece of embroidery from the foundation. How interesting and attractive it will be to execute such a piece of work, which will express the personality of the worker in all parts, design, colour and stitchery. Greater technical excellence, as well as charm, must accrue; the embroideress will work with more judgment and understanding, and because it has gained so much in interest to her, she will be able to express herself more freely, and her work will convey and suggest more to others.

CHAPTER II

THE ART AND CRAFT OF EMBROIDERY--THE SIX POINTS

“Chaires, Stooles and Screen, the same, all of Satten Stitch done in Worsteads.”

We shall now consider the six important points of design.

=Art and Craft.=--Many women have an inherent instinct for needlework--that is, the craft of the needle--for the knowledge of how to use a needle and thread is generally easily acquired; but it is quite otherwise when the design, the artistic or imaginative part, has to be carried out, as it ought to be, by the worker. Then all sorts of difficulties arise, mostly imaginary, as those who make an attempt may find.

Let us here consider the design as a necessary part of the workmanship. We shall be ambitious enough to study embroidery from an artistic point, for the art and the craft ought surely to go hand in hand.

=The Habit of Design.=--A special knowledge of drawing is not essential for pattern making--a child will make delightful patterns--nor for simple designs composed of straight lines and geometrical forms, such as might be happily applied to borders for articles of daily household use or for personal wear. A ruler, a compass and a sheet of squared paper are sufficient for initial efforts: and once the habit of simple designing is acquired it can become a wonderfully absorbing pastime, for eyes that are opened to see will find designs on every side.

=Good Taste and Common Sense.=--To carry out a piece of work successfully, however, the embroideress must possess good taste and common sense; these are indeed important qualities, the possession of which will help the beginner enormously: add to these an eye for colour and form, a practical knowledge of the stitches commonly in use, some acquaintance with materials, their utility and adaptability, and the worker will find herself fairly well equipped to start her design.

=The Six Points.=--There are about six points to be considered in connection with a piece of embroidery:--

The Object and its Use.--We must decide this, bearing in mind the position the work will occupy when finished; choosing a material suitable for the purpose, and with due regard to the restrictions of economy.

The Colour Scheme.--Consider the environment, and let the scheme be in harmony with or in contrast to the background and surroundings.

The Construction.--Plan carefully and arrange for the decoration, which should never interfere with the usefulness of the finished work.

The Building up of the Pattern.--This should always be done with a view to the limitations of the material.

The Stitchery.--This must also be adapted to the material--with bold, effective types for the coarser woven stuffs, and daintier, closer stitchery for the firmly woven textiles.

Finishing Touches.--A beginner rarely realises the importance of these, yet it is well worth while bestowing thought on them; interest may be considerably heightened by such additions or an otherwise good piece of work rendered less attractive by lack of care and thought at the final stages.

It will now be seen that the design--the least mention of which strikes terror to the soul of the uninitiated--does not consist in the drawing or the making up of the pattern alone, and that there are important preliminary stages to be gone through. Indeed the design is well on its way by the time the worker reaches the fourth point, _i.e._, the building up of the pattern.

THE FIRST POINT: ON THE CHOOSING OF MATERIALS, THREADS, TOOLS, ETC.

=Materials.=--Materials, threads, and needles are important items, and should be chosen carefully; to spend time and labour on embroidery on a poor foundation is an extravagance rather than an economy--the tendency being to make up for the poorness of the quality by the profuseness of the decoration. Materials need not be costly, but they should be good of their kind.

=Homely Materials.=--Charming things can be made out of homely cloths, remnants and oddments. Texture, tone and colour should be considered, both from a practical and an artistic point of view; a background that is pleasant to work upon is always an advantage. Linens, of varying quality and texture, can be relied upon for domestic purposes--they make for good stitchery, they wash well, and are very durable. (Plate VII.) Some unbleached materials are extremely economical.

=Greenhouse Shading.=--A soft creamy netting used for greenhouse shading, which may be obtained from any of the large seed merchants, is made in different widths from 54 inches to 72 inches. It has an open mesh and lends itself to all types of darning and needle-weaving--the narrow widths make excellent semi-transparent sash curtains, which may be brightened by applied bands of coloured linen or chintz, and finished with rows of simple running or tacking stitch in wools or in some of the coarser makes of embroidery cottons. (Plate VIII.) The thicker quality has a closer mesh and is admirable for coverlets and hangings. These, when edged and decorated with lines of bright-coloured washing braids, and wide borders of coloured cretonnes--which again may be connected with bars of needle-weaving or darning, or any simple stitchery--make charming and economical articles, such as any housewife might well be proud to possess. (Plates V. and VI.) Covers and runners to match might complete the set. This would be a pleasant and instructive work for a girl’s leisure hours; she might make just such a set for her bedroom, with the addition of chair covers and cushions, adorning them beautifully with some simple design and a colour scheme of her own choosing.

=Damask and Huckaback.=--Damask linens, with simple-patterned backgrounds, twilled sheetings, of various makes, and huckabacks, can be used most effectively for runners, mats, and luncheon sets; the soft, warm, creamy tone of the unbleached material blends harmoniously with bright-coloured threads and wools.

=Titian Canvas.=--Many coarser and more loosely woven textures make most charming and desirable backgrounds for bands of needle-weaving. (Plate VI.) Coarse canvas in various colourings, woollen hopsacks, floor-cloths, etc., are adaptable for many household articles.

=Russian Crash.=--A common roller towelling, or Russian crash, as it is also called, is a delightful material (Plate III.), and may be had in narrow widths, varying from 12 inches to 24 inches; it is woven by the Russian peasantry in small handlooms and varies considerably in texture and quality--but in all cases it is a most durable and suitable linen for domestic purposes.

=The Scottish Blanket.=--Another pleasing material for wool decoration is the well-washed, worn-out Scottish blanket; with the smaller pieces one can make hassocks and cushions which look wonderfully well in strong colours in any flat stitch; the larger single blanket can be used for coverlets or hangings--with applied decoration where the material is too frail for general hard wear. Decorated with edgings of woollen braids, etc., these will look almost new, and certainly will give immense satisfaction to the worker.

Threads are to be had in great variety and in different makes, many of which are excellent for embroidery. Cottons and flaxes in various sizes and thicknesses in a large range of colours can be combined most successfully.

=Embroidery Wools.=--Wools and yarns, particularly the types known as fingering, in three, four, and five-ply, are reliable both in colour and quality. It is always advisable to shrink wools before using them for embroidery if they are to be applied to articles which require frequent washing. Crewel and tapestry wools, to be had in hanks, “white heather” mending in balls, are very convenient for needle-weaving and canvas work, and they may be had in beautiful colours.

=Silks.=--Silks of different makes, embroidery or knitting, filosel, filo-floss and a soft, thick variety known as “Tyrian,” are all good for various purposes. The latter is particularly useful for couching lines; filo-floss--a bright, glossy silk with no twist in it--requires some skill in the manipulating of it, therefore filosel or mallard floss, each of which has a slight twist on it, is better for the less-skilled worker. Carpet chenilles in colours, both cotton and woollen, applied to coarse canvas or sacking, are used for the making of mats and rugs. Woollen and mohair, cotton and brush braids of the common skirt type, carpet and binding braids, cords and French tapes, coloured and washing gimps, all may be used with advantage for embroidery. It is better to shrink some of the loosely woven skirt and carpet braids before applying them to the material, or they are apt to pucker the material after washing.

Good needles should always be used, with well-drilled, good-sized eyes. Care should be taken to choose them so that they may be exactly suited to the thread and to the material; the eye should be large enough to hold the thread easily, in which case it will make a hole in the foundation of a sufficient size to allow the thread being pulled through without roughening it. Scientific sharps are very pleasant to use--numbers four, five and six, are suitable for cotton and flaxes, crewel and chenille, and long-eyed sharps for general embroidery and needle-weaving. For openwork backgrounds such as are shown in Plate XI, H, I, J, K, L, where no threads are withdrawn from the material, a special needle with a large thick stem and a small eye is used; it separates the threads of the material and makes them easier to gather into groups by means of the tightened thread.

In working on loosely woven materials--such as canvases--and for weaving patterns, tapestry, chenille, or rug needles with blunt points are the most comfortable to use; if these are not to hand, work with the eye of the needle foremost.

A well-fitting thimble, preferably vulcanite or silver lined with steel, is necessary. It should be deeply pitted to catch the eye of the needle and well finished, so as not to roughen the thread. Scissors of different sizes are required: a large pair with one sharp and one rounded point--these for the cutting and preparing of the material; a small sharply pointed pair for the snipping of threads; a special pair with a little square knob on the one blade and a sharp point on the other for cutting out threads and sections between embroidered and openworked parts; these are a safeguard and prevent the snipping of the work.

Frames are not necessary for the simpler types of work, but for wide borders in needle-weaving, particularly for the novice, a frame will fix the warp threads by keeping them taut, and prevent puckering of the material--little tambour frames which consist of a couple of rings, the one fitting into the other, will serve the purpose.

Finally, a small emery cushion, for polishing the needle should it get sticky or rusty, a piece of beeswax is useful for flax threads, a stiletto for piercing eyelet holes, a yard measure, a bodkin, and some small pins, are all necessary items, which should always be at hand when wanted.

THE SECOND POINT: THE COLOUR SCHEME.

Colour lends an inexpressible charm to our daily life--it is in nature that it exists in greatest beauty. The wonderful robe of colour which she displays for us throughout all seasons and in all countries, through the flowers and fruits, trees and foliage, sea and sky, the birds, animal and insect life, all under different aspects and ever-varying circumstances, increase our admiration and pleasure. We reflect and gratify our need for colour in our intimate surroundings--dress, hangings, furniture, carpets, pottery and pictures. The embroideress who has a fine instinct for colour will arrange a scheme wherein beautiful combinations of hues, tints, and shades will mingle and produce a harmonious whole. It is for those less favoured that the following hints are given. A knowledge of the principles of colour will serve as a guide, while the use of a chromatic circle, _i.e._, a colour circle, will be invaluable to the beginner. This convenient arrangement wherein successive strips of all the colours are placed concentrically in their due proportions--as in the prismatic spectrum--will enable her to study the varieties, the relations and the peculiarities of colour and help her to arrange and select those hues, tints and shades which will combine well together; it will aid her to obtain happy effects with some appreciation of its harmonies and contrasts.

The three primary colours, green, red and blue--green being now generally accepted as a primary instead of yellow--offer the greatest contrast to each other. They are the strongest and most powerful and exercise a greater influence on the mind than any of the others; add to these, orange, yellow, violet, white and black--the sum of these six colours constitutes white, and the absence of all, black--and we have the eight from which all the other colours and their modifications can be made, easily and systematically.

=Red= (=Complementary Colour, Bluish-Green=).--Red, the strongest and most powerful, excites and stimulates the eye. It was the first colour to be used for decorative purposes by primitive man, and the first to receive a name: it is the most predominant of the warm colours, and on account of its fresh, bright, cheerful character, is much used by beginners; but this very assertive quality makes it rather difficult to combine with other hues, therefore it is well to use it in small quantities for general purposes. Red, in different hues, has always been the symbol of power and distinction. Scarlet has been used for regal robes and state ceremonials, as well as for military purposes--it indicates bloodshed and war, fierceness and courage. Red of a rosy hue signifies divine love. It has been a favourite colour with the poets from the days of Homer to our own time. The complementary of red is bluish-green.

=Blue= (=Complementary Colour, Yellow=).--Blue followed red--it is of a quiet retiring nature, soft and soothing in effect, imparting the same quality to all the hues in which it predominates. It is one of the cool colours and is symbolically emblematical of heaven, piety, and intelligence. The complementary of blue is yellow.

=Green= (=Complementary Colour, Purple=).--Green, the most prevalent colour in nature, and the least stimulating, has a remarkably distinct and striking effect on the eye. It is highly refreshing as well as soothing, and is the necessary restful colour, the opposite of red. Yet the nervous power of the eye is sooner exhausted by strong greens than by any other hue; thus, a piece of work with a preponderance of green is not so pleasing to look at constantly as the piece where blue predominates. Symbolically, green is the emblem of bountifulness, youth, happiness and prosperity. The complementary of green is purple (violet-red).

=Yellow= (=Complementary Colour, Blue=).--Yellow approaches white, and is therefore a brilliant and advancing colour. It possesses the greatest power of reflecting light; is rather difficult to combine unless modified. Bright yellow has been used emblematically, to express charity, joyousness, plenteousness and old age--greenish-yellow is the symbol of jealousy and envy. Its complementary is blue.

=Orange= (=Complementary Colour, Greenish-blue=).--Orange, coming between red and yellow, partakes of the nature of both--it expresses warmth, fruitfulness and wealth. The complementary colour is blue with a tinge of green.

=Purple= (=Complementary Colour, Green=).--Purple is the quietest of the rich colours, being composed of red and blue. It varies in tone according to the amount of its constituents. When blue is predominant it is symbolical of mourning, expressive of sorrow, sadness, and is called violet; when inclining to red it becomes warmer and richer. It expresses dignity, pomp, and regal power. Its complementary colour is green.

These six bright colours, when used in conjunction with black and white, with each other, or with their complementaries, will strengthen, intensify and enrich each other without altering their true value--when such vivid effects and sharp contrasts offend the taste of the worker, when they appear too crude, too conspicuous and too obtrusive--which they are apt to do--they may be harmonised quite simply, either by modifying the complementaries or by using a tint or a shade, that is, a lighter or a darker tone of the same colour. The strength and potency of these startling contrasts are in this way tempered; they become less glaring, less assertive, pleasanter and simpler to arrange, and lose the jarring effect they might have if used in their full brilliancy. For simple household articles with little decoration these bright colours may be used with charming effect. It is well to remember, in choosing the tints and shades of a colour, that the foundation material will have a considerable influence on them. On a white ground they will appear stronger and brighter, their tone being heightened by the white or light background, while on a black ground they appear more distinct and brilliant, particularly light ones, the contrast being greater. Dull hues gain in brightness when used with black and lose accordingly when combined with white.

=Juxtaposition of Colour.=--Colours, then, when associated, influence each other simultaneously in various ways, darkening and lightening, adding to or detracting from, as the case may be--thus, by placing a light and dark one in contact, for example, black and white, the former looks blacker, intenser, while the latter looks more startlingly white on account of its dark neighbour.

It is advisable, also, in arranging the colour scheme--after taking materials and positions into consideration--to determine at the very outset what the leading features are to be, and to have _one_ colour in the scheme more predominant than the others, either in intensity or in area. There should be some central point or points of interest which will attract the eye to certain parts of the

construction.

=A Dominant Colour.=--A liberal use of a dominant colour, by conveying a definite impression, will give decision of character as well as beauty of tone to the work, while a vague, uncertain, or too equally distributed arrangement will leave an unsatisfied and indefinite impression on the mind.

[Illustration: PLATE II.

SOME USEFUL STITCHES (_See p. 29_)]

There are abundant suggestions to be had from fields, hedgerows, flowers, plumage of birds, etc., for the embroideress who can adapt them to her purpose, but a simpler plan for the beginner is to choose her colour scheme from a good picture, a coloured illustration, a piece of chintz, cretonne or good brocade, or, when possible, to study the various pieces of old embroidery preserved in our museums, as a record of the time when we could compete with other countries, when embroidery was almost the sole occupation of women of rank, as it was of the occupants of the convents.

=Green.=--If we were to use one of the primaries as a dominating colour, say green, a bluish-green, we might have as a background a deep pomegranate red, the design could be worked out in bluish-greens, grey-greens, soft blues and purples, with touches of pale chamois yellow here and there; all the colours should have a tinge of bluish-green, the combining colour.

=Blue.=--Or we might choose blue, the pleasantest, simplest and most harmonious combining colour, and select as a background a warm white or cream. The decoration could be carried out in various tones of blue, deep rich blue, turquoise, deep and pale orange, and a blue grey--much would depend on the tones used in combination and the manner in which they were employed. Always avoid a spotty effect, and do not contrast colours too suddenly in an endeavour to emphasise special points.

=Red.=--Red, when used as the predominant or combining colour, looks best on a dark blue or a cream background. With a dark blue ground, white or cream, bright greens and a touch of dull orange will work in well with the reds, the former combining to make the latter less assertive. With a white ground and the same colours, the work becomes suggestive of some of the beautiful Bokhara embroideries in which reds, greens, blues and yellows--the latter used sparingly--are combined so gaily and instinctively.

CHAPTER III

CONSTRUCTION AND DESIGN

“A cunning workman, an embroiderer in blue and in purple and in fine linen.”

We shall now discuss the decorative points.

The construction and the building up of the pattern may be taken together.

=A Simple Pattern in Needle-weaving.=--The simplest design for an initial effort should be one which could be executed in needle-weaving such as is illustrated in Plate I. Here the spaces for the decoration are marked off on the material, there being no necessity to put any design on to paper--the weaving may be done in any simple primitive pattern, or from some of the more interesting darning pattern samplers, or it may follow some idea or fanciful invention of the worker. It should be more or less symmetrical in colour and form, and provided that sufficient thought is taken in arranging the colour scheme and that the technique is good, the result should be both pleasing and decorative. (See Chapter V. on needle-weaving.) Supposing the material and the colour scheme to have been already decided, and that a loosely woven texture--which demands a simple conventional pattern with bold stitchery and bright colour effects--has been chosen (let it be a runner, table cover or any article suitable for household use). It would be best, as simplicity must be the keynote, to have a marginal or border design, built up entirely on straight lines and geometrical forms. First plan out the material and arrange for the decoration; decide whether the pattern is to be placed on to a wide hem, or inside a narrow one, or whether it is to be applied as wide bars at the ends and edges of the runner. The limited space at the disposal of the designer will often aid and suggest the pattern.

The decoration should, when possible, strengthen the construction. Be careful at all times to place it where it will not interfere with the usefulness of the object. A cushion, for example, ornamented with raised embroidery or with large beads, conveys the idea of _dis_comfort rather than of comfort, which is, after all, the _raison d’être_ of a cushion, the addition to a room, by means of colour and decoration, being a secondary point.

In the early days, when decoration was so freely applied by primitive peoples to seams, hems, shoulder-straps, indeed to all objects, it was their aim to increase the usefulness of the article rather than to decorate it.

=A Border Pattern.=--When the above-mentioned points have been decided, take squared paper, ruler, and pencil, and draw a few nicely spaced lines; duplicate the outer ones to give weight to the edges. All these lines crossing at the corners will form the framework of the design. Regularity and order are as essential in needlework as in most crafts, therefore the care and precision taken in the earlier stages will aid in the working of the later.

=The Construction.=--Plan carefully and arrange for the decoration, which should never interfere with the usefulness of the finished work.

=The Corners.=--The treatment of the corners presents the greatest difficulty. In a frame they are structurally the weakest parts; for this reason the ornamentation is placed at these parts to bind and strengthen, as well as to decorate them. In a piece of needlework with a simple border design they are again the most important. One expects to find unity, enrichment and massiveness there where the lines cross; we add, therefore, a few extra lines or chequers to the corners. By this means we enlarge them, and by so doing append dignity and importance. Still greater emphasis and the necessary note of interest will be given by the colour and the stitchery--the treatment of which should always be in the foreground of the mind of the designer.

=Principle of Repetition.=--Do not aim at great variety of form; repetition is one of the first principles of design. The beginner will save herself much worry and labour if she keeps this principle before her, instead of striving--as she invariably does--after variety. She should make her form--a square, an oblong, or whatever simple element she may have chosen--recur at regular intervals, and all corners should be alike.

=Masses connected by Lines.=--Masses should be joined by connecting lines and the spacing so arranged as to give value to the rest of the work.

=Value of Spaces.=--A form or element should never be cramped into a space nor stretched out unduly in order to fill one; it should be planned and balanced to look as if it just belonged to it. A design is well balanced when the elements are so adjusted that they are neither too monotonous by over repetition nor confused by too much variation.

=Diagonal Lines.=--It is safer at the earlier stages to avoid diagonal lines, or forms made up of such lines, for several reasons: they give a restless effect which should be avoided if possible, they present to the embroideress considerable difficulty of manipulation--coming, as they must, on the bias of the material, which may easily be tightened, puckered or pulled out of shape in the working by the inexperienced hand.

=The Game of Design.=--There is really no limit to the possible patterns which may be built up on straight lines and geometrical forms. The needlewoman has only to try with a ruler, pencil and squared paper in order to discover that she may, after some little practice, make most elaborate designs with interesting results. There are, of course, certain fundamental principles which will help her, but they are not many, and with the suggestions already given she should be able to arrange many simple designs suitable for her own use. It might be quite a pleasant occupation for the younger members of a household, on a winter’s evening, to start and play at design. A time limit, perhaps a quarter of an hour for the first effort, and a longer period as the patterns became more elaborate, might be given; afterwards all the designs could be exchanged, compared, criticised, and then judged by an older member. In this way a “habit” of pattern making might be cultivated. Many of the designs should prove valuable to the craft worker as well as interesting to the youngsters.

=Circles.=--From the making of patterns with straight lines we go on to circular forms, with radiating lines. This opens up a wide field to the embroideress, allowing her to extend and vary her simple designs indefinitely.

With this new element, the circle, she can formulate some of the more definite floral shapes, and arranging them in an orderly manner, symmetrically, can make a geometrical pattern suitable to her purpose; she can make use of compasses, or if these instruments are not at hand, any circular form, such as a plate or a coin, will suit admirably. Should these prove too small, there is always the simple device of the fixed pin encircled by a thread, with the pencil at the opposite end, which, when the pin is held firmly in the centre of the space--as the thread must remain taut--will form a circle, the size being fixed by the length of the thread.

Circles at once suggest natural forms and growth, but to begin with the young designer must keep to the geometrical side of Nature; natural floral forms will come later. If she examines carefully a number of the flowers of the field or hedgerow she will find

that many of these beautiful forms are built up on a geometrical basis--she will note the radiating lines of the flowers, the sepals, petals and stamens, the venation of leaves, the manner in which the mid-rib gives off, gradually, the beautiful curving lines which flow into the outer edges, and the wonderful orderliness of the little seeds clinging to the sides or centre of the seed vessel, and thus she will realise that all curving lines are but segments, or parts of circles of various sizes.

To aid the designer in her first efforts let her turn to an elementary text-book on botany--she will probably find there a number of diagrams of horizontal sections of the commoner wild flowers. These give the plan of each flower typical of the family to which it belongs--all the parts are arranged symmetrically in circles or whorls, and show how the flower is built up. The embroideress should find these sections full of suggestions; she might take the simpler forms to begin with and elaborate them, adding fresh details where necessary for the development of her design. By comparing the sections of one flower with another--of the wild rose with the poppy, the purple loosestrife with the forget-me-not, the primrose with the daffodil--she will be able to obtain variety with simplicity and balance; then she will connect and join all the masses with straight or curved lines, and thus give completeness to her design.

With increased knowledge of the structure of flowers the embroideress will gain a keener sense of observation which will be of great value when she studies the natural forms.

Setting forth once more on the high adventure of making her own design, she will bring to her aid the principles already learnt in the making of straight lines while she was building up her patterns and designs.

THE FIFTH POINT: THE STITCHERY.

We express ourselves and our ideas in embroidery by means of stitches and colour.

To have pleasure in the craft, the needlewoman must have a fairly accurate knowledge of the technique. Stitchery should at all times be as simple as possible, and carefully adapted to the material and the design.

=Simpler Types of Stitchery.=--The commoner types, those which by experience and long use have been proved to be the most beautiful or the most practical, are the best. All the more complicated forms are merely modifications or combinations of these simple types, many of which are used in “plain” needlework. There are, in fact, few stitches which a careful worker cannot master in a very short time.

=Stitchery not the Most Important.=--It is wise to remember that stitchery is not the most important factor, but only one of the many which go to the making of good and artistic work. Beauty, in needlework, consists, not in the variation and elaboration of stitch, but in the harmony of material and technique, as well as of form and colour.

=Unity of Stitch.=--Where coloured threads are used it will often be found advantageous to adopt one stitch only. Many of the charming pieces of embroidery stored up in our museums give us an idea of what can be done in this way, and though we lack, perhaps, both time and patience nowadays, there is no reason why we should not, by cultivation of our tastes, raise the level of the art considerably above its present standard and prove that we can still produce embroidery--of the modest, reticent type--adapted to our own conditions of life, which will reveal both refinement and artistic delight.

To execute a piece of work in one stitch would be excellent practice for the young embroideress, whereby she would learn to know and use a stitch in all its varied aspects. She need not fear monotony--the coloured threads will give sufficient variety. Let her take the simplest of all stitches to begin with--the tacking or basting stitch--and keeping it and its many varieties in her mind when planning out the pattern, she will find that she has many delightful ways of executing it. Tacking or basting stitch, worked in rows, becomes simple darning, a background stitch with which she may make charming patterns and fillings, _ad libitum_. (Plates II. and XII.) Worked closer, it is a running stitch, wherewith braids may be tacked in place (Plate IV.), frills gathered up, seams of frocks connected, or smocking prepared. Finally, when worked with the same quantity of thread on the under and upper surfaces of the material, it attains a new dignity, and becomes satin stitch--the stitch beloved of the young modern needlewoman, who is generally inspired and stimulated by the wonderful skill and precision of the Eastern needleworkers.

=White Backgrounds.=--White backgrounds, when embroidered in white or with only a little colour, may have much greater variation in stitchery; it is a relief to the worker and an improvement to the work--indeed, should the embroideress feel so disposed, she has here the opportunity of displaying her knowledge of stitchery to a considerable extent, always keeping, of course, within the limits of good taste.

She should endeavour to suit the stitchery to the work, to produce the desired effect without too much labour--not that work should ever be done in a hasty or untidy manner--but, as said before, she should adapt it to its purpose. It is well to remember that large pieces of embroidery, generally seen from a distance, demand bold, effective treatment; detail is lost, so can be omitted; smaller pieces, seen at closer range, should bear inspection, therefore more delicate treatment may be applied; detail and finer stitches can be seen to advantage. (See Chapter XII. for stitches and the method of working.)

THE SIXTH POINT: THE FINISHINGS.

The aim of the embroideress is to make her work beautiful, as well as suitable for her purpose. If she has the gift of originality she will also make it distinctive, possibly unconsciously, by adding here and there those little touches of individuality which will mark the work as characteristic of herself.

It is in the finishings that she has most scope for these dainty devices; for by their means she may add interest and artistic detail to the simple garment or article of domestic use and render them charming things to look at. She may attain this end, not by obtaining expensive fitments, rich cords and silk tassels, such as are sometimes applied, most unsuitably, to embroidered cushions, table squares, and other objects that require frequent washing, but by the use of braids (Plate VI.), and bindings (Plate VIII.), and bands (Plate IV.), hand-made cords and tassels, linings, edges, fringes, beads and buttons, raffia and plaited straw.

Thus, the amateur will find it well worth while giving some thought to the making-up and finishing off of her embroidery. She will soon realise, too, the possibilities of making many of these ingenious devices herself wherewith to adorn her work, and she will feel well repaid in the end when she has contrived some simple embellishment at little extra cost.

Hand-made cords and tassels (Figs. 38A and 41), fringes and edgings (Figs. 34 and 42), may soon be made by skilful fingers; bright-coloured skirt braids and carpet bindings and hand-made cords of dyed string or wool give a decorative effect to hems and borders--a wide hem looks well with a heading of brush braid or a piping of coloured galoon or narrow Russian braid oversewn with wool, or a narrow band of needle-weaving. Material and edges may be joined, chair backs and runners may be brightened, dress fitments may be completed simply, artistically and economically, by means of these braids, connected with dainty joining stitches (Figs. 26 and 29).

Wools of various qualities may be brought into service to make fringes and cords for cushions, etc.; seams may be decorated and joined with insertion stitches, worked by hand (Fig. 25), or by the crochet needle (Fig. 63); fastenings may be secured by latchets of wool, thread, or silk, or cord, all of which are easy of manipulation and much prettier than machine-made articles.

By referring to Plate XIII., it may be seen that much may be achieved by means of braid in the decoration of a useful bag; for description, see page 153.

Charming hand-made braids which may be used for many purposes, such as waist cords, latchets, ties, belts, hat bands (Fig. 40), may be made by means of an embroidery frame, a lace cushion or a small hand loom.

For the handles and joinings of bags, see chapter on needle-weaving.

Beads and buttons are useful for ornamentation--they give richness and weight wherever they may be placed; and as an addition to fringes (Fig. 35), tassels and ties, they are most effective. Flat beads and buttons may be applied to embroidery provided they do not interfere with the use of the object; this they would do if it were in such constant use as to require frequent washing.

Small beads may often take the place of French knots, giving much the same appearance to a border or hem.

Washing galoons and gimps, bindings and trimmings, may be effectively applied to dainty little tea and luncheon sets, as well as to children’s dresses and overalls, they may be further embellished with narrow borders of needle-weaving worked in coloured cottons or in flax threads.

For method of making fringes, tassels and braids, etc., see Chapter XI.

CHAPTER IV

DARNING STITCHES--BACKGROUNDS AND FILLINGS

“The needle’s work pleased her, and she graced it.”

There is an infinite variety of pattern to be made with darning stitches, and fortunately many needlewomen have sufficient originality to invent little variations to suit their work and material. Most of the patterns on Plate II. are intended to be worked on a loosely woven foundation where the threads are easily counted, such as some of the coarser linens, single thread canvases, greenhouse shading, and tammy cloth for finer work. These darning patterns are better worked with a blunt needle and a long thread, as it is rather awkward, at times, to join new threads in the middle of a pattern, especially an openwork one (see Fig. H). Simple fillings like these may greatly enhance the effect of a piece of embroidery. It will be seen by referring to Plate II. that they might be worked so as to form quite a number of patterns in straight lines (Fig. A), in waves or chevron pattern (Fig. C), in clusters or stars (Fig. F), in lines of slanting stitches (Fig. D), in groups of squares or chequers (Fig. E), in vandykes (Fig. G), or in any of the openwork stitches as Figs. J and L.

=A Simple Openwork Filling.=--Fig. J is a pretty little pattern suitable for a border, for the foot of a child's frock, for a jumper, for table mats, or for any article where a dainty openwork appearance is wanted. It consists of straight lines in a vertical overcast stitch, worked in rows, from left to right and from right to left.

These upright stitches are in groups of two, worked over four threads of the material; each row is separated from the other by two strands of the material.

=To Work Fig. J.=--Unfortunately the Fig. J does not show this filling to advantage. When the pattern is worked it will be seen that the intervening strands, in conjunction with the open spaces, form tiny little crosses, which add transparency to the work.

A filling more tedious to work, but with a more open appearance, is got by overcasting every stitch on the advancing row, and on the return row working the upper part of each stitch into the lower space of the row above, thus leaving no strands between the stitches or rows.

=Vandyke Border, Fig. G.=--This pointed pattern, worked in a single row, makes a good finish for a border or hem.

To work as Fig. G, each group requires seven stitches to form it, the shortest covering four threads and the longest twelve; the last stitch of each group forms the first of the next one.

=Pyramid Filling.=--The size of the groups may vary; large and small vandykes may alternate. Another filling somewhat similar may be made by taking the stitches horizontally instead of vertically; in this way groups of little pyramids are formed. Each row should be worked with alternating pyramids. The simplest method is to begin at the top with a short stitch over two threads, work five more horizontal stitches, increasing in width, right and left, by one thread, so that the sixth stitch covers twelve threads of the material. Work in oblique rows.

Strips of vandyke pattern may be worked over large backgrounds with good effect. Make five horizontal stitches over five strands of canvas, each stitch being below the other, but one thread to the right of the last; then work four stitches beneath these, each stitch being this time one thread to the left of the one above it; continue for length required. Start the second row on a level with the first and six or seven strands to the right of it.

=Fig. B, Arrow-head Filling.=--This is a useful stitch for covering the ground quickly. The three stitches are here formed over six vertical and ten horizontal threads, but, of course, the number must always depend upon the quality of the material. The vertical stitch is worked first, then the left slanting stitch, followed by the right. In working with loosely woven cloth, it is necessary to carry the working thread up behind the material to the top to start each stitch. This uses rather more thread, but the stitches lie better and the work is not puckered.

=Fig. F, Star Filling.=--Here, a number of stars are worked in successive rows. To make them quite regular, each one should be begun at the same point. In the Fig. F they are worked over sixteen strands: start at the top left corner with a double stitch, then make the horizontal stitch below, and so on till complete. By tightening the working thread a little a hole is formed at each corner, and in the centre of each star, which makes the pattern an open one, provided the working thread is not too thick, in which case it would fill up the hole.

An equally good background for a firmer material is to work stars in two rows, diagonally, one up, one down, leaving always an equal number of strands between each star. In this way the material itself is formed into little diamond-shaped panels or lozenges.

=Fig. C, Wave Pattern.=--This is one of the more elaborate darning patterns. It makes a more solid filling and takes rather longer to work than some of the others. Many pleasing variations may be formed with darning stitches, where the background weft or warp threads are utilised to form the pattern.

=Damask Darning.=--Materials may be repaired by a linen, twill, or damask darn, in which case the weft threads have to be put in first by the worker before the pattern can be woven.

Work Fig. C by lifting two weft threads in descending rows and passing over seven; after working six rows the pattern is changed by the two weft threads being lifted in ascending rows, the last of the descending counting as the first of the ascending row.

In a twill darn, the pattern of weft threads descends all the time in regular diagonal lines.

It is quite worth while copying some of these damask patterns from table napery, and reproducing them on a larger scale in bright colours--in order to see what effective designs they are; they might well be utilised as fillings for squares, stools, or cushions.

[Illustration: PLATE III.

A RUNNER IN CRASH (_See p. 63_)]

=Fig. A, Single Darning.=--A simple grounding pattern, such as that of Fig. A, is useful; it is quickly worked, too, a number of threads being lifted by the needle at each stitch. Start at the left corner; pass over four and lift two weft threads alternately for the first two rows; for the next two rows, lift the two weft threads in a line with the centre of the long stitch, and so on.

=Basket Pattern.=--A basket or brick pattern may be got by working four rows with the lifted threads in a line, instead of two, as Fig. A, before changing the stitch. This pattern looks very well when the chequers are worked with contrasting colours. Work four vertical stitches first, in lines, and in one colour, over eight strands; then take the contrasting colour and fill in all the horizontal stitches. If one colour only is used these squares may be worked in rows, the vertical and horizontal sections alternately.

=Fig. H.=--This type of work makes a rather more open background than some of the others; it is very suitable for filling in small spaces, for handkerchief sachets, nightdress bags or borders for collars or handkerchiefs.

It should be worked with a fine coloured or white lace thread, sufficiently strong to draw the strands firmly together, yet fine enough to leave the spaces as clear as possible. As a filling it is easily and quickly worked, as no threads are drawn out, which is a recommendation.

The pattern is worked over six threads both ways--with the exception of the first stitch--and in two horizontal lines. It will be noted that the stitches are not quite vertical, being inclined towards each other in twos.

=A Good Filling.=--To form the first stitches, bring the needle out at the top left corner; count down over six strands and three to the right; insert the needle and take a horizontal stitch under six strands to the right. The slanting stitch is now formed by inserting the needle into the hole on the upper line made by the first stitch, and taking a horizontal stitch under six strands to the right on that line--the upper one; proceed in this way to the end of the space. The next row is worked from right to left. The thread should be tightened after each stitch to increase the open space.

=Fig. D, Diagonal Filling.=--This grounding pattern consists of rows of slanting stitches, worked downwards over six strands of material; the working thread is taken across from corner to corner of a square, each successive stitch being taken three strands below the upper one; a strand of the material forms a mid-rib between the inverted rows. If preferred, these rows might be separated by a line of backstitching, in which case two threads should divide each row of slanting stitches; this gives a clear line for the backstitching.

These backgrounds and darning stitches described above are well suited for working on coarse materials with thick threads--as well as with finer ones; although the patterns for the majority of workers are too laborious for very fine stuffs, they may be used for small spaces in linen embroidery such as fillings for flowers, or initials.

Charming open groundings may be worked without removing the threads of the foundation material, but by drawing them in clusters tightly together, by means of stitches. Compare Plate II., where the fillings, Figs. H, I, B, K, L, and M, are worked in this way.

These patterns can be only shown properly on a loosely woven cloth, such as canvas, linen, or cambric. For fine material a fine lace thread is required.

=Fig. I.=--This pattern consists of little squares and crosses. In Fig. I it has been worked with a thick thread and the strands have not been pulled together--in order to show the method of working; but as already explained, it requires a fine thread and tightened strands to show to advantage.

=A Filling in Squares.=--Begin the pattern with vertical stitches, in horizontal rows over six strands, exactly as in Fig. 10, until the required space is filled, drawing each group of threads tightly together; then work the horizontal stitches over five strands to complete the squares, tightening them also, but not to such an extent as to pucker the material. The squares may be made smaller and the open spaces larger if each stitch is worked over twice with a very fine thread.

=Fig. K, Squares and Stars.=--Here, each square takes up sixteen strands of linen, and each one is completed before going on to the next. Work by overcasting all round the outside of the square over four strands, and make an inner square, as Fig. I, with a cross stitch in the centre, taking care to finish with the needle in a position to begin the next square.

=Fig. L, Square Stitch and Rhodian Embroidery.=--This pattern is made up of rows of square stitches separated by vertical ones. It is usually worked without removing any threads from the material, although with a very firm cloth it is rather an advantage to do so when an insertion is wanted; in the latter case the vertical threads connecting the rows of square stitch are left out.

This is a stitch one frequently finds in old linen embroideries, particularly of old German and Italian work--where it is used either as a border or insertion, or as a separating line between squared or diamond-shaped forms; there is a similarity in the working of it to the stitches used by the people of the Island of Rhodes--latterly known as Rhodes embroidery or punch work--the only difference being that it covers the entire background in Rhodian embroideries and the threads are more closely drawn together. In these Rhodian embroideries the rose is frequently to be met with. It is the symbol which invariably accompanies the head of Helios on its coins, and to which the classic isle owes its name. Square stitch can be worked in straight or in slanting lines, see Fig. M--the former is the simpler, as each square is completed in one row, while the latter requires two rows to complete it.

To work on horizontal lines, Fig. L, begin at the right-hand side and make an upright stitch over six threads; take a slanting stitch at the back and bring the needle out six threads to the left at the base. Take a horizontal stitch to the right, inserting the needle at the foot of the vertical stitch; take an upwards slanting stitch at the back to the left and insert the needle into the top of the first stitch. This forms three sides of the square. Now bring the needle out in position to start as for the first upright stitch. If properly worked, the reverse side forms a series of crosses. Fig. L has a row of these square stitches with an alternate row of upright stitches worked from left to right between them. This is a pretty and unusual combination of stitches, and it makes a charming border worked in colour on a loosely textured material for a collar or other small article. Another variation of the same type, and still more open, is to have double rows of square stitch between each row of vertical stitches, the lower row of little squares coming between those of the upper row.

=Fig. I, Square Stitch in Slanting Lines.=--To work this stitch in slanting lines is rather a slower process. The first row forms a series of zig-zags or little steps on the right side, while on the wrong side it forms two single lines on the bias of the material. Begin at the right-hand side of the work; take a horizontal stitch from left to right over six threads; a slanting stitch at the back to the left brings the needle out six threads below the starting-point. Take an upright stitch and put the needle into this point--two sides of the square are now formed. Take a slanting stitch at the back and bring the needle out six threads to the left of the base of the upright stitch and continue for the distance required. This slanting line of square stitch is easily acquired if the worker remembers the appearance of the stitch, on the “wrong” side as well as the right.

=A Table Scarf in Russian Crash.=--This design is another of the direct type in which the needle-woven border forms the principal subject. The material is very pleasant to work--it is of a soft greyish-cream colour, which combines well with the wools and braids, and the texture is sufficiently open to allow of the threads being easily removed, which is a recommendation when preparing for the needle-weaving and the fringe. The stitchery is all done in wools, and the colours are dark heliotrope with two lighter tints, blues (two tones), greens, a dark and light emerald, and deep orange. The broad braid is of soft blue, the narrow of straw colour. The design forms a deep border divided into panels by bands of braid; the bands are tacked into place by short button-hole stitches in the darker shade of emerald green, between which are tiny little loop stitches (Fig. 3), in orange. The centre panel has a wide band of needle-weaving, about three inches deep, which is divided up into five groups; the groups are worked from the outside, inwards, as in Plate I., and the various colours are introduced into them. The most prominent colour in the scheme is blue, accentuated in this case by the blue braid, the blue edging, and the second and fourth groups of weaving, which are worked in two shades of blue. The first and fifth groups are woven in heliotrope with orange in the centre; the middle group has light heliotrope on the outer parts

and pale green on the inner. This same green is worked in oriental stitch on each side of the central 3-inch bar, while the stitchery between the rows of wide blue braid is in the lightest tint of heliotrope, tacked down with tiny stitches of the darkest shade. The two side panels are worked in satin stitch in two tones of heliotrope, each row of chequers being connected by small chequers in light green--they also are worked in satin stitch. The lines of straw-coloured braid are sewn down with French knots in heliotrope (Figs. 22A, 22B). The pattern of the stitching on the bands of braid which border the design is worked in the same way as loop or oriental stitch; the needle is brought out on one side of the braid and inserted on the other side, just opposite, then brought out again in the centre to the right, where the wool is tacked down with a tiny stitch; the needle is again brought out on the edge of the braid, about half an inch further on, inserted on the lower edge and brought out in the middle again in order to tack the wool down. These two stitches reversed give the diamond shape of the insertion; three satin stitches in orange give a bright little note to the edging. These looped or petal stitches worked in different ways can be used to form many pretty headings. The narrow edging on the selvedges between the lines of blue braid is charming; it consists of two loops of heliotrope in two shades--the one worked within the other--with a closed looped stitch in orange between each pair. When all the embroidery is finished, the weft threads are withdrawn from the remaining ends of the material, which have been left for the fringe. Sometimes a fringe of a closer texture or of a different type is worked, or the material may be too short to allow of one--in all of which cases a strip of cloth could be inserted under the braid and sewn down with the pattern, then fringed.

It is generally advisable when working with narrow braids to take the ends through the material where they can be stitched firmly in place; wider ones are often tied at the ends to prevent spreading, then turned in and stitched.

CHAPTER V

NEEDLE-WEAVING--RUSSIAN OPEN-WORK--LINKED STITCHES

“A web made fair in the weaving.”

Needle-weaving is a form of decoration common to all countries; it was practised by primitive peoples and must have preceded embroidery. It was a means of adding richness and colour much in favour with t This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located in the United States, you will have to check the laws of the country where you are located before using this eBook.

FOREWORD

In this volume is presented what we confidently believe to be the most complete collection of authoritative information on the subject of personal beauty and the best methods of acquiring and preserving it ever offered to the public in compact, handy, inexpensive form.

All the newest and best ways of helping a woman to retain her youthful charm for an indefinite period are clearly described in these pages, and with them are given more than one thousand tested recipes which will be found of the greatest assistance in attaining the desired end.

Every statement made in this book is based on long and thorough practical experience; every recipe has the endorsement of the greatest living authorities on aids to beauty. Madame Lina Cavalieri herself has followed the advice which she here generously passes on to other women. The preparations for which recipes are given are all ones the famous prima donna herself uses, and to their use she owes the fact that for so many years she has been acclaimed the most beautiful woman on earth.

The woman who owns this book will be freed forever from dependence upon unreliable “beauty doctors” and expensive cosmetics of doubtful value. Here she has all the best advice the world affords to help her make the most out of the skin, the hair, the eyes, the teeth, the figure and all the other charms with which Nature has endowed her.

Most of the thousand and more recipes this volume contains can be easily prepared at small expense right in your own home. And no one need have the slightest hesitation about using any of them. Not only are they personally recommended by Madame Cavalieri but they have the endorsement of all the greatest beauty specialists of both America and Europe.

Great pains has been taken in their selection and any whose value seemed doubtful or which might by any possibility have harmful effects have been rigidly excluded.

The world to-day places a higher valuation upon personal appearance than ever before. And this is why a book like this, which explains just how to make the most of your physical self, is certain of a warm welcome from the public.

THE PUBLISHERS.

MY SECRETS OF BEAUTY

CHAPTER I

THE CARE OF THE COMPLEXION

For every woman--or, for that matter, every man--who wants to have and retain a good complexion, the one thorough toilet of the day should be made in the evening. This done, the other toilets throughout the day may be brief and more or less perfunctory.

The real housecleaning, particularly of the face and neck, should take place at night. The reason for this is apparent. The skin has been in contact with the dust and smoke and countless other soiling agents out of doors. At night, immured in the bedroom and swathed in bed clothes, there is slight chance of vagrant dust settling on the skin.

Another reason is that if the day's grime is allowed to remain upon the face or neck, it becomes imbedded in the pores, and a part of it, at least, is taken into the circulation, and thus carried through the body.

Wash the face most thoroughly at night. First, with a coat of cold cream which may be wiped away after leaving it on for a few minutes. Second, with tepid water and a mild soap. If you use a face cloth, let it be of soft silk or muslin or cheesecloth, but personally I prefer just the palms of the hands.

Do not rub the face hard. A hard rubbing loosens the skin, causes the muscles to sag and makes wrinkles form.

Last of all, give the face its cold cream bath. This is indispensable to the person who would have a good complexion. A skin food such as lanolin may be used instead of cold cream for the face bath if preferred. A cold cream that is excellent for softening and cleansing the skin is made as follows:

Cocoa butter, 32 grams; spermaceti, 32 grams; oil of sweet almonds, 160 grams; white wax, 16 grams.

A more elaborate and expensive cream that is also a helpful skin food is compounded as follows:

Lanolin, 2½ ounces; spermaceti, ¼ ounce; oil of sweet almonds, 2 ounces; fresh mutton tallow, 2½ ounces, cocoanut oil, 2 ounces; tincture of benzoin, ½ dram; Portugal extract, 2 ounces; oil of neroli, 10 drops.

Almond milk is an old-fashioned favorite still in use in some of the best formulae for complexion emollients and bleaches. A good astringent cream that both bleaches and softens the skin is this:

Almond milk from 50 crushed almonds; rosewater, 1 pint.

If the mixture is not smooth, it should be strained through a cheesecloth or soft silk before using. In this form it is softening and whitening. With the addition of ½ ounce of alum it is strongly astringent besides.

With the cold cream or the skin food massage away the wrinkles made by a hard day. With rotary motion, massage away from the corners of the eyes to the hair line. In the same way, with the tips of the fingers, iron out the lines which concentration has written between the eyebrows. With the tips of the middle fingers, massage the lines upward from the corners of the lips to the nostrils, and try to eradicate the ugly little lines in front of the ears by rubbing gently upward.

[Illustration: MARY GARDEN The author of "My Secrets of Beauty" selects the famous prima donna as one of the best examples of the "well rounded" woman.]

The care of the complexion in Winter differs considerably from that in Summer. For example, to counteract the coarsening, drying effect of the Winter winds, I use more than the Summer quantity of cold cream. Winter, too, is a greater promoter of wrinkles than Summer, because it dries the skin, and the wrinkled skin is always a dry skin. The following formula will be found a valuable aid when the skin shows a tendency to dryness:

Oil of sweet almonds, 60 grams; cocoa butter, 12 grams; white wax, 6 grams; spermaceti, 12 grams.

For a few complexions cocoa butter is an irritant. For these I would recommend this cream as more soothing:

Oil of sweet almonds, 100 grams; white wax, 20 grams; spermaceti, 100 grams; rosewater, 10 grams.

Whatever cream is used it should be well rubbed into the skin, after which what remains--all that the pores will not take up--should be wiped off with a soft cloth. The skin that is much exposed to the cold air should be especially well fed.

In Winter, more than Summer, the face marred by unsightly red blotches shows its unlovely bent. First, I should try for this internal remedies of a cooling, laxative nature. Sour or buttermilk drunk in large quantities, say six glasses a day, is much used at present to that end. It has the effect of cooling the blood and is milder than many such agents.

Another help in clearing a mottled skin is the complexion mask. There are many mask pastes of various sorts which are admirable for this purpose. From them I select this one as the most worthy and effective of all:

Liquid honey, 1 ounce; barley meal, 2 ounces; white of one egg.

After thoroughly cleansing the skin at night, first with cold cream, then with warm water and a mild soap, apply the paste, spreading it smoothly and evenly with the fingers upon the cheeks, nose and forehead. In the morning add ten drops of tincture of benzoin to a quart of warm water and with this remove whatever paste remains on the skin.

It is easy to do the complexion irreparable injury in Summer. One too long fishing jaunt, one automobile dash with the skin ill protected against the burning sun; a too long dawdling on the toasting sands, and the evil is done. The once beautiful complexion has become a memory. In its place is only a dry, withered remnant of what was once a fresh, soft, rose-like skin.

How to prevent such a tragedy to beauty--for no woman was ever beautiful without a good complexion, and no woman with a good complexion can be less than attractive--I shall try to tell you. First and last and always, vigilance.

First prepare your skin for an outing. It is best never to use hot water on the skin. But if you insist upon that pernicious habit, at least do not use it shortly before going out, for the hot water renders the skin acutely sensitive to any new influence. The wind cuts more deeply into it. The sun’s rays burn farther. They reach the danger line to which I have referred, and that really exists.

To prepare the skin for its battle with the elements of a long Summer day, the face should be cleansed with tepid water and almond meal instead of soap. The action of the almond meal upon the face is soothing and cooling. Before going out into the heat dust the face lightly with rice powder, which will adhere better if a very light coat of cold cream has first been administered.

This famous old English cream is one of the best for the purpose:

Cocoa butter, 2 ounces; lanolin, 2 ounces; glycerine, 2 ounces; rosewater, 3 ounces; elderflower water, 1½ ounces.

If sweet cream is available, bathe the face freely with it. If this doesn’t quickly allay the burning, try this cucumber cream:

Almond oil, 1 ounce; olive oil, 1 ounce; white wax, 1 ounce; spermaceti, 1 ounce; essence of cucumber, 2 ounces.

If, as may happen in a country resort, this excellent milk of cucumbers cannot be procured, follow the face bath of sweet cream with one composed of:

Slices of one cucumber; sweet milk, 1 pint.

If the case is not hopeless but obstinate, this “honey balm” should relieve the brown hue of tan that follows a deep but not irremediable skin burning:

Orange flower water, 3 ounces; strained honey, 1 ounce; cold cream, 2 ounces; white almonds (pounded to paste), 1½ ounces.

If the hands have suffered equally with the face this lotion is effectual in reducing the unlovely redness:

Lemon juice, 1 ounce; strained honey, 1 ounce; cologne, 1 ounce.

Should the unusual exposure result in freckles the application with a small sponge or bit of cotton, of either of these I recommend:

Powdered borax, ½ dram; sugar, ½ dram; lemon juice, 1 ounce.

Another application that may be used is made of:

Muriate of ammonia, ■ dram; lavender water, 1 dram; distilled water, 4 ounces.

If the case is less severe, I recommend for freckles this:

Peroxide of hydrogen, 1 ounce; ammonia, 10 drops.

These may all be more deftly applied with a camel’s-hair brush than in any other way.

Strawberry water, which was the bath of some of the court beauties of an extravagant age, may be used in season by American beauties for the freshening of the facial skin discolored by tan or withered by too great exposure or by lack of care after that

exposure to sun or wind. It is made thus:

Crushed strawberries, 2 pounds; alcohol (95 per cent.), 1 pint.

Before retiring it is well to give the face three baths, first with pure cold cream to remove the coarser dust; second, with tepid, if possible, distilled water--if not, water softened with borax or benzoin--and, last, a light coat of cold cream.

If the danger line has not been reached, nor even approached, these applications should restore the complexion to its former delicacy in a few days. If the case is not hopeless but obstinate, this paste should relieve the brown hue of tan that follows a deep but not irremediable skin burning. I have given to this, which I have often used after an automobile tour, the fitting name, “Honey Balm”:

Orange flower water, 3 ounces; strained honey, 1 ounce; cold cream, 2 ounces; white almonds (pounded to paste), 1½ ounces.

This is one of the cooling creams desirable for use in summer.

Oil of almonds, 1 pint; olive oil, 1 ounce; cucumber juice, 1 pint; white wax, 1 ounce; spermaceti, 1 ounce; cucumber juice (which has been boiled, skimmed and strained), 2 ounces.

Excellent for freckles, tan and other discolorations is this:

Sour milk, 1 cupful; horseradish, 1 teaspoonful. Scrape the horseradish into fine shreds and let stand in the sour milk for six hours before using. Then wash the face freely in it.

Fresh buttermilk is a cleansing, freshening, tan and freckle removing face bath to be taken at night.

This, too, is a lotion which has been recommended by many:

Citrine ointment, 1 dram; oil of almonds, 1 dram; spermaceti ointment, 6 drams; attar of roses, 3 drops.

For either freckles or liver spots this has been in many instances curative:

Solution of ammonia, 1 ounce; bay rum, 1 ounce; rosewater, 1 ounce; powdered borax, 1 ounce; glycerine, ½ ounce; distilled water, 10 drops.

Still another formula for freckles and tan is this, which has a great popularity:

Ammonium chloride, 1 dram; distilled water, 4 ounces.

Some faces, otherwise pretty, are disfigured by a greasy or oily skin in the summer. The need is met by this lotion, which is at once cleansing, cooling and drying. It should be used as a face bath twice or oftener a day, according to need:

Rosewater, 5½ ounces; alcohol, ½ ounce; boric acid, ½ dram.

After using any tan or freckle lotion containing acid, cool the skin by massage with a pure cold cream.

For sunburn I would suggest, as an old and tried remedy:

Equal parts of oxide of zinc ointment and cosmoline.

Cooling for the sunburned surfaces is rosewater or a solution of bicarbonate of soda. Apply them with a sponge or bit of cotton, using them repeatedly until the burning sensation disappears.

For the removal of freckles these have been recommended after much use:

A solution of powdered niter, or a solution of bicarbonate of soda. These should be applied to the face night and morning.

Once after motoring on the Italian Riviera, I saw some most unwelcome spots on my nose--light, yellow, obtrusive--resembling the dots with which a turkey egg is flecked. A chauffeuse sent me this prescription, which I have since used many times, always successfully:

Lactic acid, 4 ounces; glycerine, 1 ounce; rosewater, ½ ounce.

This also is as efficacious as it is simple:

Glycerine, 1 ounce; juice of ½ lemon.

For the excessive and odorous perspiration that troubles many in summer, I recommend this formula for a dusting powder. Its use should be preceded by a sponge bath of the affected portions. Afterward apply the powder with a soft cloth or powder puff:

Powdered alum, ½ ounce; powdered boric acid, ½ ounce; oil of eucalyptus, 20 drops; subnitrate of bismuth, 1 ounce; oil of verbena or orange, 5 drops.

For a refreshing bath in mid-summer this lotion, either sprinkled freely into the bath or splashed upon the body by handfuls immediately after leaving the bath, is my choice among a score of such recipes:

Strong vinegar, 200 grams; tincture of benzoin, 200 grams; tincture of red roses, 200 grams.

My favorite cold cream is this, which I have prepared under my eye:

Lanoline, 10 grams; oil of almonds, 100 grams; rosewater, 100 grams; white wax, 5 grams; spermaceti, 5 grams; oil of rose geranium, 5 grams. Melt the lanoline and white wax and spermaceti. Add the oil of almonds. Warm again and add the rosewater, little by little, stirring all the time.

This is my favorite face powder:

Best talcum powder, ½ pound; boracic acid, ½ dram; calcine magnesia, 1 dram; powdered Florentine orris root, 1-5 ounce.

This skin lotion I have used in the summer with much benefit to my complexion. I have found it cooling and healing:

Bitter almond water, 6 ounces; orange flower water, 4 ounces; glycerine, 2 ounces; boracic acid, 1 dram.

This is excellent for sunburn:

Sweet milk, 1 teacupful; juice of 1 lemon. Squeeze the juice of the lemon into the milk and let it stand in a cool place until it curdles. On retiring apply the mixture to the face with a silk sponge or a bit of cotton.

A face bath every night of buttermilk is helpful. Like the preceding it should be washed off with tepid water after it has been on the face for a half hour. If the sunburn is deep and obstinate better try one of the milk baths several times a day.

Another good treatment for sunburn is the application of a stiff paste made of Fuller’s earth and rosewater.

This is a cooling face lotion, preventive and cure as well of sunburned skin:

Orange flower water, 2 ounces; rosewater, 2 ounces; tincture of benzoin, ½ ounce; borax, 1¼ drams.

For freckles this simple preparation is one of the best I have ever known.

Horseradish root, 1 ounce; borax (powdered), 2 drams; hot water, 1 pint.

This more complex mixture is effective for blackheads and tan as well as freckles:

Ammonia water, 1 ounce; bay rum, 1 ounce; rosewater, 1 ounce; powdered borax, 1 ounce; glycerine, ½ ounce; distilled water, 10 ounces.

For the cornerstone of the care of my complexion I depend upon the body bath. We who would be beautiful get many hints from our physician, who is himself not at all beautiful, but who, if we obey him, can make us so. He talks about “local treatment” and “general treatment,” and he tells you that in most cases general treatment is far more thorough than local.

That is the reason that I depend upon the body bath more than anything else for my care of the complexion. It is general treatment, while massage and the application of lotions and creams are local treatment. Both are needful, but the daily body bath is indispensable.

To make the bath tonic stimulant and agreeable I have made many experiments. The most successful I have found to be this:

To a tub half full of water add one pound of table salt and one pint of violet ammonia.

The bath should be prepared ten minutes before one enters it, for the salt should be thoroughly dissolved and the ammonia should have been thoroughly mixed with the bath.

This I vary by the use of one pound of sea salt and half a pint of aromatic vinegar.

These preparations being of an astringent nature should not be used every day. Three times a week are enough for their tonic effect. For a soothing bath I leave off the salt and pour into the tub:

One ounce of tincture of benzoin and two bath pastilles, scented to your taste, but never colored.

This is the way I take it. As soon as I rise in the morning I plunge into my tepid bath. The temperature I take myself, to be sure that my maid has made no mistake. When the thermometer which I thrust into the water registers about 98 degrees Fahrenheit I am satisfied. If higher, it is too warm. If lower, it is too cold.

I permit myself just twenty minutes in the tub. More than that is weakening. While in the tub I play about as joyfully as a young porpoise. I plunge and flounder and toss up a shower of water with my hands; for to lie lazily in a tub of water is to invite rheumatism and neuralgia. I rub upon the brush quantities of the purest scented soap I can get. I try first this, then that soap. I am always trying to find something I like better than the last. I scrub my body vigorously--as vigorously as the women of the Loire pound their clothes upon the stones on the river.

I rise, streaming with rills of soapy water, and take a cold shower bath upon my shoulders. Perhaps I use the hose attached to the bath. Perhaps I catch the water as it flows from the cold faucet in my hands and throw it over my shoulders. Perhaps my maid dips a sponge in the cold water and dabs the upper part of my body quickly with it. Then out of the tub I spring upon my bath mat and give to myself, or my maid gives me, a quick rub with eau de cologne. Thus the three purposes of my bath are fulfilled. The warm water is cleansing. No one but an Englishman believes that a cold tub cleanses the body. It merely galvanizes it. To be clean we must use warm or hot water, and hot water weakens the bather.

From the tepid water I am clean. It has left the pores open as so many hungry mouths. The dash of cold water closes them. It shocks and stimulates the skin, making the blood, which has rushed to the centers of the body, bound back again to the surface. The eau de cologne rubbed slowly opens the sealed pores again. Then comes the fourth and final stage of my bath. It is the exercise.

The exercise may be running about my bedroom a dozen times, taking the sun bath. The body is too much clothed. This is the only time that it ever drinks in the sunlight. To take the sun bath at any other time would be dangerous; but immediately after the tub it is beneficial. If the day be a cloudy one I take, instead of the sun bath, my breathing exercises.

Twenty-five times I raise my arms slowly in front of me until they are stretched straight and high over my head. Then slowly I drop them again heavily, as though my hands were of lead, at my sides. This at a distance of about three feet from the open window. I am wrapped in a woolen bathrobe. Always a woolen bathrobe.

Thus for the general treatment. Now for the local. I sit in my dressing chair, which has a back reaching halfway to my shoulders. If the back were higher it would prevent a free movement of my body when I brush my hair or massage my face.

While I have been in the tub I have not washed my face. It is now to have its first bath. The bath is still not a liquid one. It is of cold cream. I give you here one of my favorite recipes:

Rosewater, 500 grams; oil of sweet almonds, 500 grams; white beeswax, 20 grams; spermaceti, 20 grams; oil of rose, 3 grams.

All these articles should be absolutely pure. If you do not trust your druggist, send them to a chemist to be analyzed. It is expensive, but it never pays to economize in the complexion. Let me tell you how to prepare the cold cream:

Place the beeswax and the spermaceti in a steamer. The steamer should not be placed upon the stove, for the fire would be too harsh for it and would taint the cream with its odors. Place the steamer, instead, in a pan of hot water and let the mixture be gently heated. With a long-handled wooden spoon stir in slowly the oil of sweet almonds. Drop the rosewater, little by little, into the mixture and stir again. When it is thoroughly mixed, pour it into a stone jar or a china vessel, and when it has cooled add three drops of oil of rose. If you use the oil of rose before the mixture has cooled, the perfume will evaporate.

You will have when you have done this an ounce less than a pound, or fifteen ounces, of absolutely pure cold cream, which will last for many months if not wasted.

I massage my face sitting before the mirror of my dressing table. This, I have found, is far better than the lazy way of massaging it while in a reclining position. I want light for massage. I want a stream of it over my shoulder, my left shoulder preferably, falling upon the mirror and showing me any line that I might have acquired since the morning before. Sitting there before the mirror I give my face vigorous inspection. I mercilessly scrutinize it. Wherever there is the slightest tracery upon the smooth surface, upon that spot I concentrate. I massage my face for ten minutes, always keeping in mind the purpose of the massage.

That is, that wrinkles are caused by defective circulation in one spot, and that the way to remove them is to increase the circulation in that spot. Sending a fresh supply of blood to the sunken region will tend to fill out and plump it.

Therefore, I concentrate on the region from the corners of the lips to the nostrils, that region where the ugly diagonal lines come and hint of ill temper or illness or old age; on the space between the eyebrows where the lines of worry form; on the area about the outer corners of the eyes, an area corrugated by too much laughter; all these and the rest of the face I massage by quick, light pats of the cushions of the ends of the fingers--light, but firm.

Always with a motion round and round. A lengthwise motion causes the muscles to sag and pulls the skin loose from the muscles. It is very bad. After the rotary movement I go over the face with quick, light, but stinging slaps. With a square of thin, soft linen I remove any surplus of grease that has not been absorbed in the pores.

For the skin that becomes overheated and looks feverish after massage, this cooling, soothing lotion may be used:

Extract of violet, 350 grams; extract of rose, 35 grams; tincture of orris, 80 grams.

Dashed upon the face after the morning massage, it is deliciously cooling and refreshing. If you do not care for the liquid face bath, fluffing daintily over the face a powder puff dipped in rice powder is sufficient.

To the window I go, hand mirror in hand, for a further inspection before applying the rice powder. I see, perhaps, acne, a bit of what you in this country call “blackhead,” at the side of my nose. I hasten to remove it. How? Not by pressing it out. No, no. That leaves an ugly hole in the skin. It is a mutilation of the face. No; I search for a match or a wooden toothpick. Then I take from my toilet table one of two preparations--each is good:

Rose water, ½ wineglass; peroxide of hydrogen, ½ wineglass. Shake well in a glass. Dip the match into the mixture and press the dampened end upon the blackhead. It does not remove it, but cleanses its color to white.

Or I use this, which I think is milder:

Rosewater, 2-3 wineglass; ammonia, 1-3 wineglass. Shake well together in a tumbler. Dip the end of the toothpick or match in it and use as other preparation. Like the other this cleanses without removing the acne.

If my plans for the day include a railway journey or an automobile spin, I prepare my complexion for the ordeal. Before going out I massage the face again with cold cream and dust it once more with rice powder. This fortifies the face for the whirlwind of smoke or dust it encounters. When I return, to thoroughly cleanse the face, I steam it. Into my stationary wash bowl I pour two quarts of boiling water and one ounce of tincture of benzoin. I bend forward and place my face as close to this as possible. I wrap about my head a towel and swathe the towel--a big, Turkish one--about my shoulders and the edge of the bowl, so that no steam can escape. So I remain until I feel that my face drips with perspiration and until I am nearly suffocated by steam. Then, sitting up straight, I dab one of the linen squares about my face and cool it by a hand bath of eau de cologne.

Or, if the journey has been taken in summer, and I am tanned or freckled in consequence, I apply this:

One wineglass full of rosewater; fifteen drops peroxide of hydrogen.

I bathe the face with this preparation and leave it on the skin for fifteen minutes, then remove it by massaging the face with the cold cream for which I have given a prescription, or with rosewater. The peroxide is drastic, and should only be used in emergencies.

And now the day is passed and I am ready to retire. Again I think of my complexion. For the first time that day I really wash my face.

First, it has its bath of soap and water. I use plenty of soap, but make a lather of it in the bowl, instead of placing it directly on my face. Plunging my hands into the soapy water, I bathe my face with the palms of my hands. Never do I use anything else. A sponge or a cloth is too harsh. There is nothing softer than the palms of a woman's hands. They are softer than silk, and because they are the softest objects I know I bathe the delicate skin of the face with them. After the warm water face bath I rinse the bowl and the face with cool, not cold, water. Cold water is too severe.

Then, again, the ten minutes of massage, with the cold cream. Then to bed. I feel that I have done for my complexion the duty I owe it. I owe it but one more, to sleep for eight hours in a room where the windows are as wide open as possible, my bed being out of the draught and myself well covered with blankets, for to be cold is to commit a crime against the complexion.

One other precaution I may take if the morning inspection has revealed that there are pimples on the face. It is a remedy, most simple, but efficacious.

In the morning bath a handful of starch. Before retiring a paste spread over the face and made thus:

One tumbler half full of water. The remainder filled with starch. Stir to a thick paste.

Every woman who gives her complexion the right care has to spend many hours at her dressing table. This should be low, so that you can sit before it with comfort. It should be wide, and long, and flat, so that it may hold all of those accessories of the toilet which a woman wants within reach as she sits before her mirror.

It should have a large mirror, and a good one, a just mirror, but not a merciful one, that will reveal every blemish, but will not exaggerate it. The faults of our faces trouble us enough without being exaggerated by our mirrors. Money spent for a good mirror will yield you a good return in honestly showing you how you look. If you know exactly how you look, you can build upon that foundation of knowledge a new and better appearance.

Being sure that your mirror is reliable place it where it will have the best light in the room. This should be opposite, if possible, but certainly near to the window. The best light for writing is the best light for dressing. The light should fall over the left shoulder. Arrange your electric lights, or candles, or lamps, or gas jets, whatever are your lighting facilities, so that the light will fall in that direction. Don't dress by a poor light any more than you would read or write by a poor light.

The mirror should be as large as possible and should be adjustable. Attached to supports on the table it should be easily swung back and forth, according to the angle of view you wish to get upon yourself.

Even if the table be of the plainest sort, of home manufacture, the table and mirror frame should be white. The effect of daintiness and cleanliness is given by a white table and mirror frame. Spots and stains can be more easily removed from it. Some young women have a fancy for draping their dressing tables in muslin or silk tied back with ribbons, or in silk finished by tassels of the same shade, each to match the curtains at the windows and the draperies of the bed. Personally I prefer the white painted or enameled dressing table to any other. Draperies are elegant, but besides their elegance I always see their other significance--that of dust traps. In furnishing rooms I try to put the money into rich woods and rugs, and shun draperies.

If the owner's means permit it a duplex or triple mirror is better than a single one. I would allow the young woman at her toilet literally to see herself as others see her. She would study her profile and note whether her cheeks were growing too plump or too thin. She could see whether the line of her coiffure is as becoming to the sides as in front. She could study her shoulders and learn whether they are too lean and need fattening, or too fat and require thinning. Having once dressed before a duplex or triple mirror you will set about getting one.

But if yours is a good single mirror you can still make your toilet very satisfactorily with the aid of a hand mirror. This will in a little longer time enable you to scrutinize your profile and back successively, instead of seeing all three views of your head at once.

On most dressing tables we see a brush and comb. This is the worst possible place for them. Perhaps they are there merely for ornament, to complete a handsome ivory, or silver, or gold set and give the spectator a sense of the completeness of the table furnishings. But the comb and brush that are in use should be carefully kept in a drawer of the dressing table or in a toilet closet, or in one of the medicine chests with which bathrooms are now supplied. After using them, and before putting them away, be sure to cleanse them. If you neglect this your combing and brushing might almost as well not have been done, for the dust in your hair has merely been shifted to your comb and brush, and unless removed by cleansing, will be merely transferred again to the hair.

A brush can be cleaned by rubbing it briskly upon a towel. A comb can be wiped thus or with a piece of tissue paper. But they should be dipped every fortnight at least in soapy water, into which a teaspoonful of ammonia has been sprinkled.

The toilet table should be furnished also with a tray or box containing the manicure utensils. The orange wood stick should be ready for cleansing the nails and pushing back the skin that is anxious to encroach upon the nails. In a drawer there should be a package of medicated cotton. In a flask on the toilet table there should be a little peroxide of hydrogen. This not to “touch up the hair,” but to serve two worthier purposes. The orange wood stick wrapped round with a bit of the cotton and dipped into the peroxide--or better, the peroxide poured upon it--will quickly cleanse the end of the nail that has been darkened by dust. The peroxide is also valuable for a gargle, or to give the mouth one of the frequently necessary baths.

In one of the little silver or ivory or enameled boxes, of which a toilet table cannot have too many, there should be a little powdered pumice stone. When the daily scrutiny reveals dark stains upon or between the teeth, apply this pumice stone by dipping an orange wood stick or a hard round toothpick into it and gently rubbing with them the stained surface. Never use a toothpick for this purpose, for this would scratch the tooth and erode the enamel.

One of the toilet bottles on my dressing table I always keep filled with rosewater. This is soothing when the face is fevered, and is always grateful and healing to the skin. In another bottle I keep a strong toilet vinegar to inhale or to sprinkle about my neck to revive me when I am fatigued. This vinegar beauties of the time of Louis XV used to brighten their complexions by sprinkling it upon their faces when they were fatigued or indisposed. It is composed of:

Honey, 6 ounces; vinegar made of white wine, 1 quart; isinglass, 3 drams; nutmeg, ½ ounce; shredded red sandalwood, 1 dram. Place all these in a bain marie and allow the mixture to simmer, but not boil, for a half-hour. Cool, and strain through silk or cheesecloth. It is well to use this lotion after giving the face a bath of cream or of warm water. It is an excellent preparation for an evening toilet, but is too strong to leave on the skin over night.

This also is agreeable:

Rosewater, 1 quart; tincture of opopanax, 20 grams; tincture of benzoin, 20 grams; tincture of myrrh, 20 grams; essence of lemon, 8 grams.

In one of the little boxes I keep also these pastilles to freshen the mouth that has grown feverish:

Pulverized licorice, 7 drams; vanilla sugar, 3 drams; gum arabic, 5 drams.

This, if there be a tendency to sores in the membranes of the mouth, will allay them and purify the mouth:

Oxide of zinc, 60 grains; spermaceti ointment, 1 ounce; attar of rose, 2 drops.

A powder box or jar should always be kept tightly closed to keep out intruding dust that might easily slip beneath a carelessly placed lid. This powder, recommended by the famous Dr. Vaucaire, is admirable:

Rice flour, 3 ounces; rice starch, 3 ounces; carbonate of magnesia, 1½ ounces; powdered boric acid, ¼ ounce; orris root, ½ ounce; essence of bergamot, 15 drops; essence of citron, 8 drops.

No toilet table is complete without a nasal atomizer to be used night and morning, if you desire, but certainly whenever a cold approaches or is in progress. This should be filled with strong salt water or borax water in the proportions of:

Water, 2 ounces; borax, ½ ounce.

Your dressing table should be supplied with the creams and other remedies which personal experience has taught you are best suited for your skin. One of my favorite face creams was the invention of the famous Queen Elizabeth of Hungary. It is made like this:

Oil of rosemary, ½ ounce; oil of lavender, 2 drams; oil of petit grain, 30 drops; tincture of tolu, 4 drams; orange flower water, ½ pint; rectified spirits of wine, ½ pint.

Mme. Sarah Bernhardt long used this skin tonic. It was adapted to that wonderfully preserved woman’s naturally moist and oily skin. For a skin that is dry and inclined to eruptive blemishes it might prove irritating. It was composed of:

Boiling water, 1 quart; sea salt, 5 ounces; alcohol, ½ pint; spirits of camphor, 2 ounces; spirits of ammonia, 2 ounces.

This, used by the beauties of the deposed Sultan's harem, gave a complexion said to be the most beautiful in Europe:

Sweet almond oil, 4 ounces; white wax, 320 grains; spermaceti, 320 grains; powdered benzoin, 100 grains; tincture of ambergris, 60 grains; pulverized rice, 320 grains.

Adelina Patti, whose complexion has survived her voice, was long presumed, because of someone's misquotation of her words, to never use soap. The truth is, as I very well know, that she used a mild soap every night to wash her face before retiring. She insists that her face could not be really clean without it. During the day she cleanses it from dust by the use of any pure cold cream that is available.

Mrs. Langtry, too, is an advocate of soap for the complexion. A pure, simple soap she uses at least once a day, sometimes oftener.

Turkish women believe in the free use of soap. It was a princess, wife of the physician of the present Sultan, who gave me this recipe for a soap that will cleanse and soften and whiten the skin. The women of the harem regard it as the first aid to a beautiful complexion:

Shave very fine one pound of white olive (Castile) soap. Place in a porcelain kettle, covering it with cold water. When the soap has been softened by the heat and mixed with the water stir into it one-half pound of oatmeal. Mix this well. When thoroughly blended take it off the stove and when the mixture has cooled, form with the hands soap balls as large as a walnut. Or the soap can be used warm in its liquid state.

This face lotion is a favorite of the harem:

Juice of 3 lemons; glycerine, 50 grams; cologne water, 10 grams.

Egyptian women believe that the face should be bathed three times a day with hot water. The Chinese women, singularly, produce the same effect of a smooth skin by the use of cold face baths. The American habit of cleansing the face simply by cold cream had its origin in India, where women cleanse the face with vegetable oils.

A princess of the Khedive's court in Egypt told me that hot water ablutions, followed by an application of this liquid, would keep any skin fair and smooth. Certainly the clear brown of her complexion was a recommendation of the habit. The recipe is this:

Rose water, 100 grams; tincture of benzoin, 10 grams.

The women of China, Turkey and Egypt have faith in the efficacy of the juice of the beet. While in all those countries it is used as a paint many of the women have told me that they bathe their faces in it for the tonic effect of what they term the blood of the beet. They then remove the stain with tepid water.

Dust is one of the worst enemies of beauty. It settles in a dim, dingy veil upon the face, causing it to look ill kept, in a word, dirty.

To keep the face cleansed from dust keep always a bottle of olive oil and a companion bottle of witch hazel on your dressing table or toilet shelf.

Before going out pass a bit of cotton or a piece of soft linen that has been moistened in the oil over the face. Protect the face further by dusting it with rice powder.

Returning from out of doors remove the powder and dust by washing the face with yet more olive oil applied in the same way. The danger of the olive oil turning the skin yellow--for that fear exists in many minds influenced by the adage "Yellow makes yellow"--can be removed by adding to two ounces of olive oil, one half ounce of almond oil and twenty drops of tincture of benzoin. Before retiring the face should have another of these oil baths, unless you prefer to use the cold cream which is more unwieldy and so less quickly cleanses.

Strong salt water or a mixture of bicarbonate of soda in the proportions of a teaspoonful of bicarbonate of soda to a glassful of water, are admirable throat cleansers.

To keep the nails guiltless of the gray or black rim that so offends the sight, it is not enough to wrap cotton about the point of an orange stick and remove the accumulated dust. The hands must be washed often, even though not soiled, to remove the dust from beneath the nails. And if the nails have become ragged beneath the edge, which causes the dust to thickly and obstinately collect there, thrust them into soap jelly into which you have poured a half dozen drops of ammonia, or into a cake of soap well softened by

lying in the water and allow this to remain under the nails for a few minutes to do the work of cleansing.

Perhaps the skin of your face is very pale, as though every drop of blood had been drained from it, and the fact that your stock of vigor is below par is shown by the dry texture and loose condition of your skin.

Refresh it by giving it a cologne bath. Pour a few drops of cologne over a piece of gauze and pat the face lightly with it. This will coax the blood quickly to the surface. Or soak a square piece of flannel in olive oil and place it over the face. The skin absorbs this oil, and in a short time looks much fresher.

Should you, despite your tired, bloodless aspect, have to be seen in public, bathe the face in tepid water, using handfuls of almond meal, wet with a few drops of benzoin instead of soap. Then dash cold water upon the face. This soon calls back the color that has forsaken the visage.

Many Englishwomen follow the sensible practice of “giving the face a drink.” For proof of the efficacy of this carry to your bathroom a drooping, dying plant. Turn upon it with the rubber spray a shower of cool water. Instantly the fainting plant revives.

Just as grateful as was this plant for its needed draught is the skin that is parched, in the first stage of the dreaded, withering process, for its “drink.” The English woman closes her eyes, holds her breath and thrusts her face deep into a bowl of cool water. She keeps it thus submerged as long as she is able. Then, raising her head, she breathes deeply and again thrusts her face into the water. She repeats this face drink five or six times, keeping her face in the water as long as her suspended breath will permit. Wiping the moisture off with a soft cloth, she is amazed to see the response of her complexion to the treatment. Her skin seems transformed from a brownish white parchment, crossed and criss-crossed by the faint etchings that portend wrinkles, to a smooth pink and white silken surface.

Your skin should be one of the livest things in your entire makeup, yet it is that part of you which oftenest looks lifeless. A “dead” skin, as specialists know it, is pale and withered looking. It is seamed with fine lines and looks absolutely devoid of moisture.

There are many methods of remedying this regrettable appearance, which adds many years to a woman’s apparent age, and which must, by some means, be avoided.

The fundamental remedy is a change of diet. A father’s advice in a recent play, “Eat two apples and drink a glass of water before going to bed” was laughed at as old-fashioned, yet there is no better beauty rule, having the skin in mind. It gives nature prompt and powerful aid in cleansing the interior of our bodies, and without this unclogged interior there can be no clear, live skin. A mottled, pimpled skin is an infallible sign of an unclean interior.

But the apples eaten at night are not enough. Drink lemon juice slightly diluted with water in the morning. The juice of an entire lemon pressed into the glass and diluted with the same quantity of water will cleanse the stomach and aid in clearing the skin.

A remedy for a dead looking mottled skin is a teaspoonful of grape juice with the same quantity of olive oil night and morning.

A French remedy for a faded skin is to eat a small plateful of water cress with salt every day. The beauties of the harems of Constantinople rely upon any green salad eaten at breakfast with much salt for the same purpose.

Sometimes these internal remedies must be supplemented by external aids. One of the best is to moisten coarse cornmeal with milk and, filling the hands with it, scrub the face gently yet with vigor. The friction opens the pores and relieves the muddy looking skin of the poison which has choked them.

A woman whose skin at fifty is as fresh as a girl’s told me that she would as lief retire without saying her prayers as without ironing her face with ice. This causes the blood to flow to the surface, refreshing and feeding the skin.

Cold cream is needful for most complexions but not for every one. A good test of your needs is to pat cold cream into the skin and note whether it quickly absorbs it. If so the skin is hungry and requires daily feeding.

Cocoanut oil, if secured in its purest state is an admirable skin food. Olive oil feeds the skin well but there is a deep rooted objection to its too frequent use because it is charged with making the skin yellow. The owner of one of the best complexions I know, a lovely French woman, feeds her skin by nightly baths of the following:

Olive oil, 3 ounces; almond oil, ½ ounce; benzoin, ½ ounce.

In this case the olive oil's tendency to make the skin yellow, if such a tendency lies in this greatly remedial oil, is neutralized by the presence of the benzoin, which is a whitener. The benzoin has still another office useful to those whose skins have become flabby. It is an astringent drawing the relaxed skin up into the desired tightness.

Primarily the cause of most facial blemishes is indigestion. To remove an effect, one should always try first to remove the cause. Most women have some form of indigestion, and it is due to one or both of two bad habits. One is eating harmful things. The other is not drinking enough water.

Here are ten things I beg women never to eat: Sausages, dried fish, pies, bonbons, puddings, ice cream, beef, except when well roasted, pork, especially ham, oysters, unless one is absolutely certain of their freshness, hot bread, as usually made in America. I am opposed to the practice of drinking hot water. Instead of being an aid to digestion, it is a hindrance. Granted after a heavy dinner, when the sense of overfulness oppresses us, a cup of hot water, slowly sipped, aids digestion. But this should be used only in emergencies. The regular habit of drinking a great deal of hot water is harmful, for when the stomach is flooded with it the gastric juices go on strike. Finding the intruders there they refuse to do their work and retire. And the hot water is left to do the work, ineffectively and alone. So the hot-water habit seems to me a distinctly bad one.

Light foods, as chicken, fresh fish, beans, spinach and beets, containing iron, and stewed fruit, slowly eaten and well masticated, are excellent for the complexion.

Three quarts of water a day should be drunk to keep one well, which state a good complexion always follows. Drink three tumblerfuls on rising, and while you are about your morning toilet. Sip, do not gulp, it. If you are not thirsty, drink it anyway. That morning bath for the stomach is imperative. At each meal it is permissible to drink one glass of water, slowly sipping it.

For the work of cleansing the stomach I should advise a half teaspoonful of soda taken in a wine glass of water every morning. If the disorder is very pronounced I should repeat the dose after each meal for three or four days. Bicarbonate of soda, like other good things, may become a bad thing if used in excess. I am grateful to the Paris pharmacist who gave me this warning.

Pulverized charcoal is also an excellent corrective for the stomach which is tired or rebellious. One teaspoonful every morning and one after each meal is as good as a broom in the stomach.

Large, red splotches appear upon the face sometimes, seeming to try to burn their way out. This literally they are trying to do. An excess of uric acid causes this condition, and it is best to consult a physician about a cure, for it is the parent of rheumatism. If a consultation is not convenient, then diet, diet, diet.

Eat no more fruit in the morning. Eat it only at noon and night. Let the breakfast be most simple, of some coarse cereal, or crusts of coarse bread; and avoid rare meats, especially beef.

But a beauty complains that there are spots on her face and yet she must shine at a ball to-morrow. There is no time for diet, for consulting a physician, for any of the thorough roads by which one arrives at the goal of a good complexion. What she does must be quickly done.

Very well, then. A pimple mars the curve of her lovely chin. What shall be done? Use acetone.

Acetone is a colorless, ethereal liquid. It has been used chiefly to dissolve fat and resins. It is effective for asthma. Under the form of a fifty per cent. solution, with two per cent. of iodide of potassium, it has been much used in hay fever and similar irritable conditions of the respiratory tract.

Into a one-ounce bottle of acetone dip the wooden end of a match and press it upon the pimple. Then with a silk sponge or bit of absorbent cotton saturated with alcohol press the spot to disinfect it and neutralize the acetone.

Another of the hasty remedies which I would recommend is:

White zinc, 1 ounce; a pure cold cream, 1 ounce. Mix these thoroughly together and apply with a bit of cotton cloth to the pimple.

For blackheads, I have successfully used an entire face bath of a four per cent. solution of borax, wiping it off soon after and giving it a second bath of rosewater to soften the skin.

An ointment prescribed by a great French physician, whose specialty was treatment of the skin, is made up of the following ingredients:

Ergotine, 3 grams; oxide of zinc, 7 grams; vaseline, 30 grams.

Another that is quickly efficacious is:

Precipitate of sulphur, 1 dram; tincture of camphor, 1 dram; glycerine, 1 dram; rosewater, 4 ounces.

A third, that is more agreeable in its action than the last, consists of:

Bicarbonate of soda, 36 grains; distilled water, 8 ounces; essence of roses, 6 drops.

I have seen pimples removed by a half dozen applications of bicarbonate of soda, dampened slightly, and placed with the tip of the finger upon the irritated surface.

Another simple remedy for splotches or pimples is this:

Bicarbonate of soda, 36 grains; glycerine, 1 dram; spermaceti ointment, 1 ounce.

This should be applied with absorbent cotton, allowed to remain on the affected part for a quarter of an hour, and removed.

For the blotched condition of the skin, which is caused by sun in summer and wind in winter, if the skin be delicate, I recommend this:

Borax, ½ dram; glycerine, 1 ounce; elder flower water, 7 ounces.

Steaming is often recommended for cleansing the face. I do not use it because I think its tendency is to make the skin too delicate, to detach it from the muscles and to cause premature wrinkles.

I am often asked how to remove moles. I answer, “Do not remove them. In the time of Marie Antoinette they were regarded as marks of beauty. Let them alone.” But if anyone insists, I say then go to a physician and be by him guided. Probably he will remove them by electricity, but I am afraid--afraid.

Indigestion is the great foe to the complexion within. The foe to be feared without is the careless use of powders. Powder judiciously used, especially at night, is an aid to beauty. Its use in the evening is an indication of refinement. And a dainty powder fluffed upon the face before going out, especially if cold cream has first been applied, is an excellent protection from the cold or heat or from a high wind. But it is absolutely necessary that the powder be pure. Rice powder is harmless to the skin. It protects the complexion as would a fine veil. And it removes the disagreeable “shine” upon the skin that makes the best-groomed woman look vulgar at night.

This powder I have found most valuable:

Rice flour, 6 ounces; rice starch, 6 ounces; carbonate of magnesia, 3 ounces; boric acid, 1½ ounces; powdered orris root, 1½ drams; essence of bergamot, 10 drops; essence of citron, 15 drops.

CHAPTER II

HOW TO MAKE YOUR NECK BEAUTIFUL

It is a most decided advantage to be born with a beautiful neck, as it is to be born with beautiful features, a beautiful figure or beautiful hair. It is one of the compensations of being overplump that the woman of too ample lines has a beautiful throat and arms. While the thin woman, whose features are well defined, not being blanketed by superfluous layers of flesh, and whose figure is more elegant because not swathed by adipose tissue, has, as a rule, a scrawny neck and whip-like arms.

The neck to be beautiful must be neither too long nor too short, too fat nor too lean. It must be shapely; that is, evenly developed. The skin must be soft and white.

The length of the neck is one of the fixed quantities of nature. One cannot change it, but we can learn the lesson of illusion from the stage, and try to make it seem longer or shorter than it is. The best aid to this is the poise of the head. The woman whose chin is carried well up, whose poise of the head is habitually high, gives the impression that her neck is at least an inch longer than it is. Also the manner of the trimming of her high-neck gown and the line at which the low-cut gown is finished determine whether the neck looks longer than it is or shorter.

If the neck is short the collar should be of solid colors or be trimmed with perpendicular lines. The low-necked gown should be cut lower than that of the woman with the long neck, for the neck is more dependent upon its surroundings for its effect than is any other part of the body. If there is a wide sweep of the shoulders the long line from the point of the shoulder to the chin will lend itself to the neck and make the neck seem longer than it would if the gown were merely one of the collarless sort with a line of cloth defining where the neck actually begins.

If the neck is long the problem is an easier one, especially at times when much dressing for the neck is in vogue. Even an ostrich's neck could be so wrapped about with laces, with collars and ties of a contrasting color which would cut the apparent length, that it would be far less conspicuous than unadorned. I should say it could be made to look a foot shorter. The human neck can be dressed to make a proportionate change of appearance. The extremely low décolletage is less becoming to the woman with the long neck. If she must adopt it, or thinks she must, she should wear her jewels or a band of ribbon about her neck to make her neck seem shorter. The drooping Madonna poise of the head may be becomingly affected by the woman with the long neck, especially when sitting for her photographs.

The neck, I have before said, must be neither too fat nor too lean. To correct either too much or too little flesh upon the neck we must summon the aid of that lieutenant to beauty, massage. On the beautiful neck the flesh is evenly distributed. The neck should be, save for the two parallel lines about an inch apart which encircle the neck and are seen on the necks even of babes, perfectly smooth. If the flesh be uneven, persistent, skillful and gentle massage should redistribute the disproportionate bulk of flesh.

There is always a possibility that the neck will be flat in front and display thick layers of fat at the sides and back. This can be corrected by patient and careful massage. The front of the neck should be made plumper by massage. Olive oil or a pure cold cream should be freely rubbed into the skin by the first three fingers of each hand, massaging first on the right side of the neck with the right hand, then on the left with the left hand, then with both hands together. The motion should be a rotary one, always the best movement for rebuilding tissue because it induces circulation, which feeds the starved, atrophied portions.

To reduce the bulk of the back and side of the neck a reducing lotion should be applied by long, sweeping, downward strokes, the effect of which strokes is to melt the flesh downward into the larger masses of flesh on the shoulders. A lotion I have known to be used with success for the melting away of too ponderous flesh about the neck is this:

Tincture of iodine, 30 minims; iodide of potassium, 60 grains; hyposulphite of soda, 20 grains; distilled water, 7 ounces; aniseed water, 170 minims.

Be careful not to tamper with and so enlarge the large glands in the neck. Enlarging them may permanently disfigure a beautiful neck. They are the danger points of the manipulation. It is they and the gorged veins that give to a neck that aged, withered appearance which we describe by the word "ropey." Once these glands are enlarged and the veins swollen there is no art in beauty lore to diminish them. Perhaps a physician can reduce their size, but I have never known it to be achieved.

For the "aged neck" there is almost no hope. Mme. Sarah Bernhardt realized this, and while combating all the other signs of her increasing years, yielded to the demands of the neck that was no longer young, and covered it. The collarless gown is not for her. Always she wears a high-necked gown, or, if circumstances require, a costume décolleté, she wears a ribbon of velvet or a collar of jewels about her throat.

For battling against the ageing neck I can give no better recipe than this for a massage cream, which should be plentifully applied night and morning:

Glycerine, 5 ounces; mutton tallow, 1 pound; tincture of benzoin, 2 drams; spirits of camphor, 1 dram; powdered alum, ½ dram; orange flower water, 1 dram; Russian isinglass, 2 ounces.

If the neck is thin, but the veins and glands are not enlarged, there is hope. The skin must be fed by cold creams and the circulation promoted by massage. The rotary motion with the first three fingers of each hand is the desirable one. Fifteen minutes should be spent night and morning in this massage. One nourishing massage cream especially excellent for the neck is this:

Oil of sweet almonds, 10 grams; lanolin, 15 grams; tannin, ½ gram.

A successful fattening cream for the neck contains:

Alcohol (95 per cent.), 20 grams; lard or cocoa butter, 100 grams; essence of rosemary, 12 drops; essence of bergamot, 12 drops.

A third and most important essential is that the skin of the neck be white and soft. To secure this effect one must, as you say in America, “start right.” First prevent stains upon the neck.

A stained neck is always a revolting sight. A dark, shadowy rim about the neck may have been caused by dark collars and there may have been valiant efforts to remove it, but if they have not been successful I beseech you wear only high-necked collars until the stain is removed. The casual observer at a dinner or a ball will make no allowance for the cause, the stain-communicating collar of colored net or some other fabric. To him your neck will be soiled. That is all and that is very much.

To prevent such stains avoid wearing dark colors next to the neck. If the dark collar is unavoidable then line it with something soft and white, old muslin or part of an old silk handkerchief.

But, having acquired the dark, shadowy look about the neck that is so repellent remove it as soon as possible. A thorough sponging with peroxide of hydrogen, full strength, followed immediately by another bath of rose water, I have found excellent.

Or there may be frequent baths with this preparation, which is admirable for bleaching:

Glycerine, 1 ounce; rosewater, 1 ounce; carbolic acid, 10 drops; tincture of benzoin, 10 drops.

This home remedy is useful when less drastic remedies are not at hand:

One-half lemon; one small tumbler of water. Squeeze the lemon juice into the glass. Bathe the neck frequently with the mixture.

For those, and there are many, among them experts, who do not wish to use the peroxide of hydrogen full strength, I would recommend:

Peroxide of hydrogen, ½ wineglass; witchhazel, ½ wineglass.

To bleach a neck that is too oily this used once a day for three successive days is helpful:

Rosewater, ½ wineglass; ammonia, 5 drops. Use this sparingly, for the action of ammonia upon the skin is to make it exceedingly dry.

The woman who would have a beautiful neck must consider it even in repose. She should never use a high pillow, preferably no pillow at all. For when the head rests upon the pillow, the chin falls upon the breast. The muscles of the neck are contracted, wrinkles are formed and muscles become flabby. Lying on the back is the best posture for sleeping. The muscles of the neck are thus given full play and rest.

Many times I am asked “If you had a mole on the neck what would you do?” I would let it remain there, and be thankful that I had a distinguishing mark, a beauty spot. But if you insist upon removing it a physician might try electricity.

I have been asked how to remove superfluous hair from the neck. I should not remove it, for I should not regard it as superfluous. Why do American women so dislike hair upon the face and neck? There should be a fine covering of hair. It is beautiful. It is like down upon the peach.

Sometimes the collar supporter, or a pin or hook used for fastening the collar, scratches the neck. For these or any other bruises of the neck I should first bathe the injured part with absorbent cotton dipped into peroxide of hydrogen. If the bruise is severe I would apply collodion or court plaster to protect it from air-floating germs, while healing. I would remove these by moistening them with alcohol. If this precaution is not taken a bit of the skin or flesh might adhere to the application, so causing a scar. When the new skin is formed, covering the wound, and it is no longer very sensitive, I would massage it gently once a day. This relieves the congestion and gradually removes the disfiguring red line that might remain as a trophy of the adventure.

A traveling companion of mine once scraped her neck against a deck railing while the ship tossed. She treated it as I have advised and when there still remained a broad pink stain as a souvenir of the accident she massaged it very lightly every day for a fortnight, when the pink stain utterly disappeared.

If your neck is suffering from wearing a too high collar I recommend one of the following recipes:

Equal parts of peroxide of hydrogen and water. In extreme cases there is no objection to a neck bath of pure peroxide of hydrogen.

Equal parts of alcohol (95 per cent.) and water.

Equal parts of lemon juice and water.

Water, ½ pint; ammonia, 1 dram.

Still another remedy is to scrub the neck with a soft complexion brush dipped into a warm lather of Castile soap with a few drops of ammonia added.

In summer when the neck becomes tanned and blistered by the sun massage it with a pure, cold cream and bathe it frequently with a mild solution of peroxide of hydrogen.

CHAPTER III

THINGS TO DO FOR THE EYES, EARS AND NOSE

As with all other parts of the body, the beauty of the eyes depends upon their health, and their health depends upon care. The eyes have two arch enemies. They are fatigue and dust. To keep the eyes beautiful one must avoid the one and shun the other.

Do not read too much. I never read at night. Artificial light destroys the luster of the eyes. At night we constantly strain the eyes to get more light, and the strain makes a network of fine lines about the eyes. Never read on the train, no matter how long the journey. It is five days from New York to San Francisco, and many persons make that journey several times a year. But if they have regard for the beauty of their eyes they take no magazines or books on the train with them and they buy none on the way. It is quite as good a mental exercise to spend the time on a railroad journey thinking of what you have read, and of what you have learned in reading the book of life, as to read something new, and it is a thousand times better for the eyes. At its best a railway journey is a severe tax upon the eyes as upon the nerves and the complexion. I spend as much of the time as possible in a reclining position with my eyes closed.

When the journey is at its end I send at once for a solution of adrenalin. The proportions and quantity of the solution I always leave to the druggist. I would not take the responsibility of prescribing the amount for myself, and so will not for another. Adrenalin is derived from the supra-renal glands of animals. A solution of it applied frequently to the eyes rests them after a severe strain. I know of nothing more refreshing and immediately rejuvenating, but I insist that it must be used only after a physician has prescribed, or by the advice of the pharmacist, who will tell you what under the circumstances is a safe solution.

I said I do not read too much. An hour and a half a day, and that at two or three sittings, instead of continuously, is enough. Close study of a printed page is dangerous to the eyes and to other attractive features of a woman’s face.

For the sake of the beauty of the eyes--and there is no greater beauty--I utter now a different warning. If you would have beautiful eyes don’t drink too much. A glass and a half of wine at a meal is enough. A pint of wine a day is all that any woman who wishes to be beautiful should permit herself, and that only if she has been accustomed to drinking wine. Too much drinking makes the eyes bloodshot. It congests the blood vessels in them, causing disfiguring little red streaks in the whites of the eyes. It causes also a congested condition that inflames the lining of the lids.

When the eyes are tired the thing to do is to rest. Go to your room. Loosen your clothes. Lie upon your back and place upon your eyes a hot compress. Make the compress in this way:

One gill rosewater; one gill witch hazel. Heat this mixture and when it is nearly at the boiling point dip into it a bandage of soft linen, or of absorbent cotton, and press this upon the eyes.

Sometimes a friend of mine points to her yellow eyeballs and says: “What shall I do to make them white?” I answer: “You are bilious. You must cleanse the liver and the stomach. A physician or a pharmacist can best tell you how to do this. But if you do not wish to go to either try a semi-fast. Eat only half as much at each meal as you have been doing, and drink water freely. We need three quarts of water a day to keep the body in health. If the system has reached such a condition that the eyeballs are yellow then that quantity should be increased by one-half. Water drinking is a necessity that should become a fixed habit.

Every morning at rising we should drink at least two glassfuls of cold, but not ice water. If the stomach is very delicate it would be better that the water were warm. If cold it should be sipped, not tossed off at a draught, because by the time it reaches the stomach it should be as warm as the lining of the stomach itself, to prevent chilling that important organ. Throughout the day a good deal could be drunk and the remainder should be drunk in a leisurely way at night. It is well under the most ordinary circumstances to

drink two or three glasses of water before retiring. For the woman with the yellow eyeballs a half teaspoonful of bicarbonate of soda or of pulverized charcoal could be taken to advantage in a glass of the water at morning or night. Also I should advise for this woman exercise out of doors.

For the daily care of the eyes there should be two baths. The body must have its bath. The face must have its cleansing. Why not the eye, especially as the eye, with its thick lid and the fringe of eyelashes, is a dust trap, and the slightest speck of dust allowed to remain beneath the lid may cause inflammation of the lid and irritation of the eye.

For the eye's daily bath I offer you the choice of several lotions. My favorite is:

Ten ounces purest rosewater. Apply with an eyecup, turning the eyecup upside down so that the half open eye is completely washed by the contents of the cup. Hold it thus for thirty seconds, or, if not uncomfortable, a full minute. Throw away this rosewater. Rinse the glass and give the eye a second bath. If the eyes are irritated the bath can be repeated several times. Ordinarily a bath in the morning on rising and another at night on retiring are enough.

One ounce elderflower water. Some of my friends who have beautiful eyes prefer this to rosewater. It is equally good. Apply it in the same way.

Another excellent eyebath is:

One-half ounce witch hazel; one-half ounce distilled water. Shake well in bottle and apply with an eyecup.

One other bath is excellent:

Six drops boracic acid; one wineglass distilled water. Shake well before applying.

Salt has its advocates. Certainly salt is stimulating to tired eyes, but I would only use it in emergencies. Then once a day, before retiring as follows:

A pinch of salt in an eyecup of cold water. Use with the eyecup. Also bathe the lids with a bit of cotton dipped into the salt water.

A bath of borax water is beneficial and has the advantage of always being convenient. Even while traveling one may carry a box of borax. Futhermore, it is safe, because borax will only form a four per cent. solution, that is, four per cent. of it only will be absorbed by water. A borax bath is strengthening. If the eyes be delicate or the person so prejudiced against experiments that she is not willing to introduce this substance into the eyes, a silk sponge or a soft cloth dipped into borax water and pressed upon the eyelids is efficacious, soothing.

The old fashioned home remedy of cold tea leaves pressed upon the lids has value, not from the tea leaves intrinsically, but from the cool, moist contact. Cloths dipped in water are quite as good.

Whatever reduces the fever and inflammation in eyelids makes for the beauty of the eyes. And here a word of warning. If the lids become granular, that is, if tiny lumps form inside the lining of the eyelid, don't attempt to cure them yourself. Give yourself over to a physician's care.

There is nothing more disfiguring or dangerous to the eyes than these irritating little lumps. They are caused by eye strain and if the strain be removed the granules are likely to disappear. If, however, the case is far advanced it needs medical treatment.

As the greatest enemy of the beauty of the eyes is strain, so the greatest friend is rest. If my eyes were losing their brightness I should first of all rest. But rest may be taken, to use the druggist's phrase, "in small doses." If I am too much engaged to go into a dark room and rest for days I can at least rest my eyes by taking extra sleep. From the standpoint of beauty every one should retire before twelve, to give the eyes sufficient rest.

And there are twenty chances a day to close the eyes for a few minutes. Say five minutes at a time, and twenty times. There we have one hundred minutes. Those chances can be taken on the Subway, the "L" trains or in the surface cars. Often have I seen a man on a train admire a young woman for the demure, downcast glance of her eye. He thinks that is one of her individual lures. Silly man. The girl doesn't know he exists. She is merely taking an eye rest. When you are bathing your face, when you are massaging it, when you are brushing your hair, while you are being manicured or pedicured--there are countless opportunities to give the eyes the rest they need. Try it for three days and the results will amaze you.

Never use preparations in or upon the eyes, unless you have them analyzed. Do not count the cost of analysis. What are a few American dollars or French francs or Italian lire compared with beauty!

Never use any toilet article without such analysis. And even after you have used the preparation for a time it is wise to again submit it to another analysis, for when an article has secured its vogue through excellence I am sorry to say that manufacturers oftentimes increase their profits by cheapening the ingredients and adulterating the article.

The surroundings of the eyes are as important as the eyes themselves. Keep lines away from the eyes by keeping them well rested. Also massage lightly about them for four or five minutes. Never longer, because too much massage will tire the exceedingly delicate muscles about the eyes and cause them to sag. Massage them at retiring with any good cold cream.

Rub with light rotary motion, with the tips of the second and third fingers, outward and away from the corners of the eyes. With the same fingers stroke the muscles that lie along the upper edge of the cheekbone. The stroke should be a slow, sweeping one from the lower corner of the eye to the edge of the hair line. Never touch the soft, flabby skin beneath the eyes. It will make wrinkles. A third, valuable stroke is above and along the upper edge of the eyebrows. It is most soothing and restful.

The eyelashes depend for their length and beauty upon the condition of the eyelids. Do not allow them to become inflamed. If they are irritated the lashes will be weakened and will stop growing, or will fall out. To make them grow long and evenly they should be clipped two or three times a year.

If the eyelashes grow thin or unevenly it may be because the eyes are strained and the lids inflamed. To remedy such a condition I recommend either of the following prescriptions:

Rosewater, 1-3 glass; witch hazel, ½ glass. Warm and apply by opening the eye when covered by the glassful of the mixture, thus giving the eye a thorough bath.

Camphor water, 1 ounce; powdered borax, 3 grains; infusion of sassafras-pith, 2 ounces. Apply with an eye-dropper, the glass tube with rubber bulb that can be obtained in any drug store. Apply as frequently as is needed to allay the inflammation.

The growth of the eyelashes can also be promoted by frequent brushing with an eyelash brush, also by carefully clipping the ends twice a year. Brush the lashes upward and the brows toward the temples, training the arch to be high and piquant. For eyebrows that are weak and thin this lotion is excellent and should be applied frequently:

Sulphate of quinine, 10 grains; oil of sweet almonds, 2 ounces.

The eyebrows should be kept clean by brushing with a tiny eyebrow brush. A half dozen strokes upon each eyebrow is enough. The lashes should be brushed upward. That makes them curly. Sometimes eyebrows grow unevenly. They begin well, but end drearily, in a straggling line of sparse hairs or in no hairs at all. Massaging the scant parts of the eyebrow with lanolin will improve them.

Here is a most excellent tonic for the brows, and indeed for the hair. Applied three times a week it will give the hair a fine stimulus toward growth. You can get from the druggist a smaller quantity than I describe but the proportions should be as follows:

Tincture of vanilla, 6 grams; tincture of carnation, 10 grams; Peruvian balsam, O.65 grains; alcohol, 450 grams; oil of bergamot, O.45 grams; oil of lemon, O.90 grams; quinine, 0.40 grams; infusion of civet, O.10 grams; infusion of musk, 0.10 grams.

Sometimes the eyelashes show a bothersome tendency to curve inward, usually on the lower lid. To insure comfort and avoid dangerous irritation of the eyes they should be removed by careful manipulation of hair forceps especially made for the purpose.

Girls often ask me how to make their eyelashes darker. There are dyes or stains for eyelashes, but I do not recommend them. In themselves hair dyes are likely to be injurious. The application of one of them to the eyelashes by an unsteady hand might permanently injure the eyes.

Eyelashes are often too light because they are faded. To restore them to their original color, clipping the ends carefully and slightly every two months may strengthen and stimulate and so darken them. This pomade is in common use in France:

Red vaseline, 1 ounce; tincture of cantharides, ½ dram; oil of lavender, 8 drops; oil of rosemary, 8 drops. _Apply with the utmost care so that none of it gets into the eyes._

If your eyelids are encrusted when you wake up in the morning don't attempt to remove the incrustations until you have moistened them with a lotion from your eye cup. The best one for this purpose is made by dissolving an ounce of boracic acid in a pint of rosewater.

Styes are ugly and disfiguring. In their first stages they can be removed by applying ethereal collodion with a camel's hair brush. If the condition has progressed far, a tiny flaxseed poultice soon brings it to the "ripe" stage, after which it can be lanced by an ordinary needle, that has been sterilized, by passing it through fire.

If your eyebrows are straggly and uneven, and in places very thin, use an eyebrow brush twice a day. Every morning and evening brush the brows, giving them at least twenty-five strokes each and being careful to brush in the direction you want them to grow. In this way you can do much to cultivate the beautiful arch. It will also remove the dandruff that is likely to accumulate about the eyebrows. Massaging the brows at night with lanolin is also helpful.

The greatest menace to a business girl's beauty is that of eye strain. The danger that this eye strain will produce wrinkles between her eyebrows, will inflame the lids and cause the eyelashes to fall out, and will dim the brightness of the eyes and produce the tired expression of the old or of those who are devitalized by age or overwork is great.

These tendencies she must balance by greater care than the woman in her home gives to her eyes. Since the strain during business hours is excessive she should not add to that the further strain of reading on trains or by lamplight. This will cause some intellectuals to cry out: "La Cavalieri would empty our girls' heads." No, but the purpose of these articles is to reveal beauty secrets, and one of the secrets of beauty is to keep the eyes clear, bright and untired. Therefore, I repeat that the beauty in business must not read on the moving train. Nor must she read by lamplight. The best use she can make of her eyes for beauty's sake while upon a train is to close them, and her brothers or sisters would better read to her at night.

She can save the strain upon her eyes by closing them for a few seconds at a time several times a day. They as well as her face must have their daily bath, better two daily baths, one in the morning and one in the evening. The baths may be of equal parts of witch hazel and warm water, or of warm water into which a half dozen grains of boric acid have been sprinkled, or a full cupful of rose water.

And the girl who would keep her eyes beautiful must have plenty of sleep. She should sleep at least eight hours a day, more if her system requires it. If she can take a quarter or half an hour's nap after coming home from business and before her evening meal or before going to the theater or a dance, she will find her tired eyes have regained much of their luster.

Before I finish my advice about the eyes I must not forget to give still another formula which is excellent for bathing them:

Salt, ½ grain; sulphate of zinc, ½ grain; rosewater, 4 ounces. Mix with an equal quantity of water and apply with an eye cup.

The eyes tire most easily in summer and that is when they should be given an extra amount of rest and attention. Rest them from the glare of white country roads by wearing smoked glasses. Rest them by giving up the distractingly becoming but eyes-torturing, crossbarred, myriad dotted veil. Read little. Persuade your beaux, your little sisters or your maids or poor relations to read to you. Close your eyes while you listen. Don't read in a hammock nor on a lounge. Don't read on a train. Don't read in a room dimly lighted "so that it will keep cool." Rest the tired eyes by plenty of sleep at night and an afternoon nap.

Bathe the eyes night and morning with witch hazel and warm water, mixed in equal parts; or with an ounce of boracic acid in a pint of rose water.

Use an eye cup, turning the eye upward and opening it so that it will be laved by the contents of the cup. When wiping the eyes use a soft cloth, oil linen or silk, and wipe the lids toward, not away, from the nose. This will help to prevent the wrinkles about the eyes, also the wrinkling of the eyelids themselves.

For hot, tired eyes Mme. Recamier used to apply a lotion made by pouring over dried rose leaves a quantity of water of twice their bulk. If the eyes are very inflamed washing them in equal parts of witch hazel and camphor water will be found beneficial.

For granular lids many pastes have been recommended. My advice is to seek out a reliable physician and have the eyes examined and his prescription filled.

A "cold" in the eye is most annoying and liable to be expensive. You get up in the morning, look in the glass, and find that one of your eyes--or maybe both--looks much inflamed. If you do nothing about it, the condition may not pass away for a number of days,

and meanwhile you are more or less disabled.

Very possibly, in some alarm, you go to see the oculist. He frightens you at once by telling you that it is “conjunctivitis”--a long word which means simply inflammation of the membrane that covers the eye. He puts some drops in the eye, and tells you to come back the next day. You are finally cured, and the bill comes to $15 or $25.

That is well enough. Perhaps you don’t mind the bill, or the trouble of going to the doctor’s. But it is likely that you would be less satisfied if you knew that you could easily have cured yourself much quicker and without any expense at all.

If you have a “cold” in your eye, you can get rid of it within a few hours by bathing the eye freely and often with a solution made by putting _two drops_ of formaline into a teacupful of water. The formaline you can buy at any drugstore. It may be used with an eye-dropper or an eye-bath--either of which can be had from the drugstore. But it is even more effective to allow somebody else to pour it into the eye by squeezing again and again a rag or piece of cotton saturated with it.

A “cold” in the eye is nothing in the world but a germ infection. Formaline kills the germs. But don’t use formaline in any stronger solution than two drops to the teacupful. If you get it into your eye in a pure state, you might destroy the sight. At the least, you would suffer frightful pain.

Incidentally it may be said that the best eye-water known to oculists for the treatment of sore eyes or lids is made by mixing ten grains of boracic acid and five grains of tannic acid with one drachm of camphor water and enough ordinary water to make a total of one ounce. The ingredients are cheap, purchased from the apothecary, and you can prepare them yourself if you care to.

When not due to over indulgence in alcohol an excessively red nose is usually the result of indigestion or clothing that is too tight. In the first stages of the trouble Parisians bathe the unfortunate feature frequently with this, recommended by Dr. Vigier:

Distilled water, 50 grams; rosewater, 50 grams; tincture of benzoin, 1 gram; sulphate of potassium, 1 gram.

If it has become chronic, this, massaged freely into the affected organ, is recommended by M. Andres-Valdes:

Rectified alcohol, 8 grams; pure glycerine, 8 grams; precipitated chalk, 8 grams; cherry laurel water, 8 grams; precipitate of sulphur, 8 grams.

The ear is the most neglected part of the head. That a pair of ears stand out unduly from the face, making what one of your American artists term the accessories of the face, more prominent than the countenance itself, most parents regard as a wise visitation of Providence, or ignore it. Or if the ears are so jammed against the head that one can not see them without an effort, that, too, is liable to be overlooked by parents, not by anyone else who sees the child who is a victim to the malformation.

Be as careful to frame your child’s face well as you are to frame a picture, so that its colors are best thrown into relief. Some mothers are artists in the matter of the arrangement of the child’s hair, and when this is becomingly done they think their duty done. The ears are neglected.

If they stand out prominently from the head they can be trained, especially in childhood, back into the relation they should bear to the head. An ear harness made of strong cotton tape is made for this purpose and should be worn at night by children or adults who need it. It is far better, of course, to use it in childhood, when the cartilage that forms the outer part of the ear is more plastic, but it is more or less efficacious after you have reached your full growth. It is certainly well worth trying.

If the ear is packed closely against the head train it outward by gentle massage and light pulling, done by yourself. You are the best judge of whether the pulling hurts. If it does, stop. If the ears are less than the normal size they can be enlarged by the same process.

An earache that cannot be quickly relieved by placing loose, warm bandages over it should be brought at once to the doctor’s attention, for a persistent earache is often the forerunner of serious conditions, especially of deafness.

If your ears are delicate, riding in the tunnels may be permanently injurious to them. The greatly increased pressure of air under the rivers is a menace to the eardrum; may cause it to burst and bring about incurable deafness.

You do not know, perhaps, that chronic and severe diseases of the ear often begin in the nose or throat. Wherefore you are taking care of the ear when you keep the throat and the nasal passages free from obstacles. Gargling the throat every morning is a measure for health and cleanliness that no one should neglect. A tablespoonful of salt in a glass of warm water, or a pinch of borax

in the same quantity of water, will serve well. But I am inclined to the later belief that no one should douche the nose except by the doctor's order. The liquid you use for the douche might carry germs of disease into the back of the head and cause a general infection, while they might disappear in the natural way if there were no interference with nature's plan of carrying away invaders of the head. If the nose is in healthy condition it secretes a pint of liquid every day and is nature's adequate channel for clearing the head.

But the ear must not be encouraged nor allowed long to "run." A chronic discharge from the ear is a serious condition and may have a fatal end. Hasten with it to a physician. Life insurance companies, knowing how serious this is, will never insure the lives of persons with running ears.

Doctors generally advise us not to try to remove the wax from the ears. They say that if we let the ear alone the wax will finally form into a hard little ball and drop out without assistance. They advise us not to put cotton into the ears unless specially advised to by a reliable physician, who will never give the advice unless the need is imperative. They forbid poulticing or syringing the ears without special advice, and they are quite right in warning against the indiscriminate use of ear drops. Better regard the inner part of the ear as inviolate. So, too, the outer, except for keeping the folds clean. In the cleaning do not handle the ear roughly. Remove the dust from the folds of the ear with a soft cloth, soap and water. Be careful to immediately and thoroughly dry them. If you leave the neck or hair about the ears wet or chilled the earache or neuralgia that will follow may lead to deafness.

Never box a child's ears; it may cause a rupture. Do not pull a child's ears, lest injury follow. Be sure to have the adenoids removed. Adenoids in children are a cause of ear troubles, among many others. Physicians now believe that sea-sickness is due to ear disturbances.

CHAPTER IV

KEEPING THE HANDS, ARMS AND SHOULDERS YOUNG

If I were to summarize my experience and the advice I wish to give about the hands in one sentence I would say: "Never let the hands get cold." The advice is very comprehensive, and in a sense sufficient. If you never let your hands grow cold they will be soft and white and retain their natural shape and size.

For example, the fresh air curists travel the radical road to the point of keeping their bathrooms cool or cold. That is absurd. The bathroom should be kept at an unvarying temperature of 68 degrees Fahrenheit. The bather should step from tepid water into surrounding air two or three degrees warmer. Yet I have seen a famous beauty step from an ice cold tub of water upon her bath mat and shiveringly towel herself dry in a bathroom whose window opened for six inches above and below upon a court where the air was at zero. And she wondered why the skin of her hands and face were rough and purplish.

Another friend, an athletic beauty, disliked carrying a muff, and December and January found her swinging along Fifth Avenue, her pretty hands covered only with a pair of cold, thin, cramping kid gloves. She called at my atelier and showed me her hands. They were shockingly red and rough. Both she and my friend of the cold bath room had violated the first command of the care of the hands: "Always keep them warm."

For each of them I prescribed first changing their habits. "Always wash your hands in tepid or hot water," I said to the first. "Carry your muff from October to April," I said to the second. And when they had promised, I having sternly exacted that essential thing, I set about removing the ugliness. The first aid was to show them the right way to wash their hands. Not one person in fifty knows how to wash the hands.

The water should be tepid. If it is what is known as "hard water" it may be softened with a little borax, say one teaspoonful to a quart of water. Or, if possible, it would be well to use distilled water, since borax must be used with discretion.

Then dip into the water a cake of the best soap. A scented soap is not necessarily a bad soap. So I try various kinds, liking one, but seeking another that is better. When I have dipped the soap into the water long enough to make a dainty lather I plunge my hands into it.

Then I dry them, but only partly, upon a soft linen towel. Before the hands have time to dry, and especially before they have time to chill, I take from my toilet shelf or medicine chest a bottle of my favorite hand cleanser. The bottle may be large or small, but the proportions of the mixture I keep always the same. Here is how it is made:

Hydrated glycerine (glycerine mixed with water), 1 tablespoonful; any favorite perfume (mine is Italian pink), 3 drops.

Rub the hands thoroughly with this. Rub is not a strong enough word for the process. It does not suggest the thoroughness of the process. Say rather, wash your hands in it. Ten minutes is none too long for washing the hands. Five minutes should be given to the water, five to the glycerine bath. Then dry thoroughly with a towel. Observe how soft your hands are after such a bath and you will be surprised and delighted with this treatment.

[Illustration: ANNA HELD The fascinating beauty of her eyes is famous the world over.]

I am aware that there is some prejudice against glycerine. Would-be authorities will rise and say that glycerine burns an exceedingly delicate skin--that it is an irritant in some cases. So it is. The person who uses it must be a judge of that herself. It has always “agreed” with my hands, making them soft and white and supple. But for those whose hands burn and itch after using it there is this lotion for occasional, not regular, use, for I am opposed to a too free use of peroxide of hydrogen:

Peroxide of hydrogen, ¼ wineglass; witch hazel, ¾ wineglass; always shake well before using.

I should not advise this oftener than three times a week, at most. And I should vary it with rubbing with olive oil, which is of especial value to thin hands. A few weeks of using it will result in a perceptible plumpening of them.

Or, to whiten and soften the hands, this has many advocates, and I see no objection to its occasional use. Ammonia is too powerful for regular use:

Olive oil, 1 wineglass; ammonia, 6 drops.

But to assure beautiful hands, and that in the shortest possible time, massage them with a simple cold cream and wear rubber gloves at night. But the gloves should be at least two sizes larger than the 5¾ or 6 you wear in kids, and they should be punctured as freely as the top of a pepper box. Ventilation is necessary to the health of the hands and of the owner of the hands.

For a cold cream for the hands for the night toilet I should advise this mixture:

Spermaceti, 2 ounces; white wax, 1 ounce; almond oil, 2 gills.

There are two pastes that are excellent to be used as a night cosmetic with gloves:

Rosewater, 6 ounces; honey, 4 ounces; yellow beeswax, 2 ounces; myrrh, 1 ounce.

This can be prepared at home, if you desire. Melt the wax. Stir the powdered myrrh while hot. Add the honey and rosewater, drop by drop. If the preparation seems to be a bit too thick to handle comfortably thin it with a few drops of hydrated glycerine.

Another delightful paste has the following ingredients:

Tincture of benzoin, 2 drams; fresh yolks of eggs, 2 drams; rice flour, 1 dram; rose water, 1 ounce; oil of sweet almonds, 2 drams; glycerine, 1 dram.

This is a home preparation and because of the perishable nature of the eggs can only be kept for a few days.

Now as to how to massage the hands. For the face a rotary motion, but for the hands a lengthwise one. I can best describe the massage for the hands by summoning your imagination. Fancy that you are wearing a pair of gloves for the first time. That you have accurately fitted the fingers and that you have now only to see that the glove fits smoothly upon the back of the hands. You stroke the back of the right hand gently, but firmly, with the fingers of the left, and the left hand with the fingers of the right. Do this at least twenty times for each hand. Then lightly pinch the ends of each finger, pressing the sides of the fingers between the thumb and second finger.

Some excessively nervous or anæmic persons are annoyed by cold, moist, clammy hands. This is a remedy that is safe and efficacious:

Tannic acid, 10 grains; tincture of benzoin, ½ ounce; elder flower water, 3 ounces; rosewater, 6 ounces.

If there is a strong objection to soap, try the liquid sort. If your objection persists then substitute fine almond meal, a handful for one cleansing of the hands. Tincture of benzoin is also a good softening agent for the water, and its odor is refreshing. Four drops to a

quart of tepid water are sufficient.

“How can I have nice, white hands, though I do my own work?” This is the problem many housewives continually face. By wearing loose gloves as much as possible about your work. By thoroughly drying your hands after washing them, or, better still, by washing them again before they are dried, in:

Glycerine, 1 ounce; lemon juice, 1 ounce.

The beauty of the hands suffers in different ways at different times of year. In winter the cold winds frequently chap them. For this disagreeable condition I have used with good results a lotion made as follows:

Glycerine, 1 ounce; spirits of wine, 1 ounce; violet extract, 1 ounce. Pour over the hands after washing.

If the chapping has made the hands too sensitive to bear the glycerine try this:

Oil of almonds, 1 ounce; lime water, 1 fluid ounce; borax, 6 grains.

In summer the hands and arms often suffer as much if not more than the face from the sun’s burning rays. Here is a lotion which will cool them and reduce their unlovely redness:

Lemon juice, 1 ounce; strained honey, 1 ounce; cologne, 1 ounce.

If the sunburn results in freckles apply with a small sponge or a bit of absorbent cotton or a camel’s hair brush the following:

Powdered borax, ½ dram; sugar, ½ dram; lemon juice, 1 ounce.

Here is still another remedy which answers the purpose as well as the ones just described:

Muriate of ammonia, ■ dram; lavender water, 1 ounce; distilled water, 4 ounces.

For a mild case of freckles here is a simple remedy that will often prove sufficient:

Peroxide of hydrogen, 1 ounce; ammonia, 10 drops. Apply with a camel’s hair brush.

Of no part of the body is it quite so true that curves are the lines of beauty as it is of the arms and shoulders. A lovely woman in an evening gown always reminds me of a beautiful bouquet rising out of a vase. The woman’s head and shoulders and arms are the flowers, the gown and the rest of her body the vase. Fancy a bouquet with one fresh, purple pansy in the center and all about it withered yellow flowers. It is not a pleasant picture even in fancy, but that is precisely how the woman with a charming face and unlovely arms and shoulders looks.

Beautiful shoulders must first of all be symmetrical shoulders. They must be just broad enough to balance finely the figure. If the figure which they surmount be slender the shoulders also should be slender. But they should never be thin. For beauty’s sake they must be soft, not muscular. They must be overlaid with a veiling of firm flesh. They must slope gently into the lines of the arms and bust and back by almost imperceptible degrees. While they are plump in front they should be thin at the back. A roll of flesh between the shoulder blades is unsightly and gives the appearance of age.

After shapeliness of the shoulders in importance comes whiteness. Shoulders well cared for should be the whitest part of a woman’s body.

A third important element in the beauty of the shoulders is the texture of the skin. It should be of satin fineness.

To attain shapely shoulders begin with the chest. The woman with a high chest always has beautifully shaped shoulders. Form the habit of breathing deeply. A shop girl in one of New York’s department stores had so fine a development of chest and shoulders that I asked her how she achieved it. Her figure was so slender that I knew she must have built up those shoulders and the chest by some wise system of exercise.

“Yes, haven’t I done fine?” she answered. “Two years ago I was the scrawniest thing you ever saw. My neck and shoulders looked like a wood pile that had tumbled over itself. I was all sharp corners. I heard of this new deep breathing and I tried it. Most of it I did on the platforms of the “L” trains. Winter and summer I rode downtown from Harlem to work, and instead of sitting in the car I stood on the platform. At first it made me tired, but after I got used to it I began to look forward to feeling the clear, cool air rush through

my lungs. Now it's the best treat of the day. Maybe I would have got lazy and not kept it up, but I saw the flesh beginning to pad all the corners of my neck and shoulders. My chest lost its caved-in look. You just bet that deep breathing pays."

Deep breathing does pay. It pays a large dividend in health and beauty.

But next in importance comes massage. Give me an excellent masseuse and I could dispense with a doctor, except in some tremendous emergency. Thin shoulders can be plumped and fat shoulders can be reduced by massage.

If they are thin a light massage, using a rotary movement of the palms of the hands, applying olive oil copiously, will gradually plumpen them. If they are fat the massage should be much deeper and more vigorous. The masseuse should knead as near the bone as possible.

For this massage a cream may be applied to feed the tissues. Here is a good one:

Oil of sweet almonds, 20 grams; lanolin, 30 grams; tannin, ½ gram.

Yet another cream that is an excellent builder of flesh is this, so commonly in use in Europe as to be almost a household article:

Lard, 50 grams; alcohol (95 per cent.), 10 grams; oil of rosemary, 6 drops; oil of bergamot or orange, 6 drops.

If the shoulders are fat the massage should be much deeper and more vigorous. The masseuse should get as near to the bone as possible. She should use neither oils nor cream, but instead some astringent lotion, as, for instance, this:

Rosewater, 12 ounces; tincture of benzoin, 1 ounce; tannic acid, 20 grains; elder flower water, 4 ounces.

Shoulders should be white. Normally they are, and if not the general health should be looked to as a corrective. Are the shoulders yellow? Probably their owner is bilious and requires a change from a heavy meat and sweets diet to a lighter one in which cereals and green vegetables and salads predominate. The system should be irrigated by much water drinking. Try to remember that the amount of food for a day's sustenance has been estimated in the proportion of five parts to seven parts water. Are her shoulders marred by pimples or acne? Again she should look to her diet, eating less rich food. A thorough scrubbing of the shoulders with warm water and pure soap once a day, followed by a rub-down with alcohol, should be sufficient to keep them prettily white if the diet is a correct one.

If the shoulders have been tanned or freckled by much sea bathing or lolling on the burning sands, they will be improved by applications twice a day of this old-fashioned remedy:

Horseradish root, 1 ounce; borax, 2 drams. Pour over these one pint of boiling water. Apply with a sponge.

Also apply distilled water and the juice of a lemon or peroxide of hydrogen, mixed in equal parts.

The effects of a half dozen applications of these should be quickly apparent.

Arms, like shoulders, must possess symmetry. That is, they must seem to be of the body, included in the original plan instead of being hastily added as an afterthought. They must be in perfect proportion. The size of the arm depends wholly upon the size of the body.

In Paris recently a pretty little Russian, Miss Amelia Rose, won the prize for having a perfect arm. In Paris, where beauty is the chief divinity, the awarding of the prize to one not of the French nation was a momentous matter. Everyone wanted to know the proportions of the arm. The Russian beauty's height was five feet five inches. Her arms conformed to the canons of statuary. The upper arm was one-third shorter than the forearm. The circumference of the upper arm was thirteen inches; of the forearm nine inches, and of the wrist six inches.

The beautiful arm looks as though it were made for ornament, not for use. No muscle is unduly prominent. It should be as soft and smooth as white velvet. If the arm is too fat its size can be reduced by massage with the wringing motion. The masseuse should manipulate the arm exactly as though she were wringing out clothes before hanging them out to dry.

To develop the arm there are many exercises. Small dumbbells, weighing half a pound, can be swung to great advantage. Also to develop at once the muscles of shoulders and arms this is valuable. Stretch the arms horizontally from the body until the muscles are tense. Then slowly raise them above the head, trying to keep the muscles rigid. Clench the fists and, stretching the arms horizontally at the sides, raise and lower the arms. This develops the biceps. Clench the fists and turn them slowly about on the

wrists to make the wrists supple. Light massage with olive oil supplements the exercises.

I know a girl who otherwise had a charming figure, but whose arms were distressingly thin. It took two years of attention to them to make those arms attractive, but she succeeded.

The means were a change of diet to more nourishing and muscle-building food, a half hour twice a day with dumbbells, and daily massage with cold cream or olive oil. The results were soft, well rounded, pinkly white arms that charmed everyone who saw them.

An exercise that develops the arms and the back and bust as well is this: Holding the arms at the sides, inhale deeply. Clench the fists. Bend the elbows. Bring the fists to the shoulders, moving only the lower arms. With the fists resting at the shoulders raise the elbows to a straight line with the shoulders. Move the fists down slowly until they fit close into the armpits. Move the fists slowly around to the back, crossing them, and then lowering the arms to their first position. Keep the muscles tense while so doing. This is a famous resistance exercise.

If the texture of the skin on the arms is coarse, a dry rub every day with a soft flesh brush should open the pores, whose long collecting accretions have made the skin rough. This treatment will make the skin tender. If it seems sensitive apply a good cold cream every morning and evening. After the morning application powder may be added. The arms may be dusted with a pure powder. One of the best cold creams for the purpose is this:

Oil of sweet almonds, 50 grams; white wax, 10 grams; spermaceti or sperm oil, 10 grams; rosewater, 20 grams; tincture of benzoin, 5 grams; tincture of amber, 2 grams.

While reducing her arms, or before she has succeeded in so doing, the stout woman should not wear sleeves shorter than the elbow length. Her upper arm is gross and she should veil it until she has reduced it to lovelier proportions.

To keep my hands smooth and white I wash them à la Cavalieri. First in soapy water, through many waters until they are spotless as my linen. Then I dry them, but only partly, by the heat of the hands themselves, not with a towel. Then I bathe them again in this mixture:

One ounce glycerine; three ounces rosewater; ten drops lemon juice. This should be well shaken when being mixed, and also every time it is used.

Cold-roughened hands must be treated with special care at night. That is the time to give them their complete toilet. It is well for them if it has not been necessary to wash them often during the day. They must, of course, be kept clean. But better avoid soiling them during the day than wash them too often.

Buy a large pair of rubber gloves, at least three or four sizes larger than the kid gloves you are in the habit of wearing. After washing the hands in warm water, softened with a few drops of ammonia, say a half dozen drops to a quart of water, and a good, pure soap, as white castile or one of the tar soaps, bathe the hands in cooler water and, before drying them, rub thoroughly over them:

Glycerine, 1 ounce; rosewater, 1 ounce. Then draw on the rubber gloves.

If the hands be much darkened or reddened this will whiten as well as soften them:

Glycerine, 1 ounce; lemon juice, 1 ounce.

In extreme cases a paste worn for two or three nights under the rubber gloves will facilitate the work of making the hands once more presentable. This is a good paste:

Almond meal, 1 ounce; tincture of benzoin, 10 drops; honey, ½ ounce.

In similar fashion when hands have been reddened and blistered by the sun wear a pair of loose gloves at night, first covering the hands with this mixture:

Honey, 2 ounces; glycerine, 1 ounce; barley flour, 8 ounces; whites of two eggs.

Or the following lotion rubbed into the hands well will answer the same purpose:

Cologne, 2 ounces; lemon juice, 2 ounces; liquid honey, 2 ounces.

Much is asked, and much from time to time answered, about the care of the arms, yet an attractive arm may be hopelessly marred by an ugly elbow. Resolve that your arms are only as pretty as your elbows, and set to work upon them.

First examine them closely and while you examine them keep in mind the standard for a lovely elbow. To be lovely it should be little in evidence, so little, in fact, that it seems to be merely an appearing and disappearing feature--so to speak--a dimple playing peekaboo.

Instead of this what do you probably see? A sharp, bony corner, or a mass of unsightly wrinkles, in either case darker than the surrounding flesh. Almost certainly the skin covering it is dark and rough, “a patch of goose-flesh” a young girl complained when dressing for a dance.

Now what is to be done?

Try first to rid the elbows of their disfiguring redness or darker color. Rub them every night before retiring with a half grape fruit. This is better than a lemon because the elbow can settle into it and work about it. If you place the halves of grape fruit on a table and rest your elbows in them you can read or chat or meditate and leave the elbows to their bleaching for an indefinite time. Repeat this every night until you notice an improvement in their color.

But do not be satisfied with this progress. Scrub the elbows daily with warm water and a bleaching soap. One of the peroxide soaps would be useful. Or use castile soap with water, into which you have sprinkled a few drops of peroxide of hydrogen or of ammonia.

An ingenious girl I know bound slices of lemon on her elbows every night before going to bed. While this is not as quickly efficacious as the grape fruit it is cheaper.

When this gradual whitening of the elbows has been accomplished take the next step in their beautifying, which is smoothing them. If they are very rough, scrub them with a pumice stone that has been dipped into warm water. Rub the roughened spots gently with this, and slowly, lest you irritate the skin. Then apply cold cream or olive oil to allay even any tendency to irritation. Or if they are only slightly roughened, rubbing them round and round with fingers that have been spread with cocoanut oil is enough, if long continued, to soften them.

If the elbows are very sharp massaging the flesh about them with palms well greased with mutton tallow should in time nourish them into roundness.

CHAPTER V

MASSAGE AS A BEAUTIFIER

Massage is of two kinds--good and bad. It is good or bad, according to the knowledge and skill of the masseuse. I have a profound, unshakable belief in the efficacy of massage. It is my cure-all. I rarely take medicine. Almost never in all my life, in fact. For long ago I heard what your American poet, Oliver Wendell Holmes wrote: “If all the drugs were thrown into the sea it would be hard on the fishes, but it would be better for humanity.” That, from a man who knew medicine deeply impressed me.

That which will most interest readers of this book, probably, will be the consideration of massage as a beautifier. In that aspect I most earnestly recommend it. For half my life I have had my face massaged frequently, and for many years I have had it massaged every day. With what result? That my face is absolutely free from lines. That my complexion is smooth and absolutely free from blemishes. I resolved that it should approach the smoothness and clearness of an infant’s skin if care could achieve that effect, and I have succeeded.

Moreover, there is no abnormal growth of hair upon the face. With pleasure I lay the ghost of that fiction against massage. Despite all that we hear to the contrary, the friction has not caused the growth of the tiniest of beards.

If you entrust the massage of your face to a masseuse, be sure that she has had proper instruction and considerable experience. Bad massage is much worse than none, for it will cause wrinkles instead of removing them. The masseuse must know the geography, as it were, of the muscles. She must learn to follow instead of countering those muscles.

To make this quite clear, let me quote from the usually baffling words of a medical authority, Dr. William Murrell, of the Royal College of Physicians of London: “The individual muscles, or groups of muscles, are picked out or isolated and mechanically

stimulated to contraction. The movements must be made in the direction of the muscle fibers, and the tips of the fingers must be carried along in the interstitia, so as to promote the flow of lymph and increase tissue metamorphosis. The manipulations are carried out systematically in definite order with a definite object."

Massage promotes circulation. By promoting circulation it nourishes parts of the body in which circulation is ordinarily defective. The well nourished portions of the body are the last to grow old. The best illustration is perhaps those regions of the Western part of the United States where there is little rain. These regions would be waste places if it were not for irrigation. Canals are made that tap the nearest rivers. From these canals ditches are dug. The ditches form a vein-like network of little streams that feed the arid land. So massage stimulates sluggish circulation and nourishes the muscles that might otherwise grow flabby and the skin that would grow dry and wrinkled.

The face must be massaged with a nourishing cream. This is one that cleanses as well as feeds the skin, and is simple and especially grateful in midsummer:

Almond oil, 2 ounces; spermaceti, ½ ounce; white wax, ½ ounce; cucumber juice, 1 ounce.

After facial massage with a cold cream some women of exceedingly sensitive skins choose to bathe the face in this or a similar lotion:

Tincture of benzoin, 1 ounce; tincture of vanilla, 4 drams; sweet almond oil, 3 ounces; bitter almond oil, 1 dram; spermaceti, 5 drams; white wax, 5 drams; lanolin, 1 ounce; witch hazel, 1 ounce; rosewater, 3 ounces.

Having first had your face massaged several times by an expert masseuse you can learn the movements yourself and massage your own face. Some become deft at self-facial massage in a short time. Some who have clumsy fingers, or a lack of perception, never master the art. Some beautiful women never entrust their faces to a masseuse, I am told.

First look to the shadowy new lines upon your face. If there be none, consider where the lines form when you laugh, when you frown, when you sulk, or when you cry. Anticipate these lines by nourishing well the muscles in those regions.

The wrinkle regions of a woman's face are four. The first is about the outer corners of the eyes. The wrinkles there formed have been known for many ages as crow's feet, because they radiate outward in somewhat the fashion that a bird's toes are disposed. They might as fittingly be called chicken's toes, or pigeon's toes, or eagle's toes. They are supposed to be the ineradicable, unmistakable signs of age. The truth is, they are the paths of laughter, and indicate a merry disposition. I have seen them on the face of a boy of twelve. I have seen them strongly marked on the countenance of a young woman of twenty-one. They are the measures of the laughing capacity of the person who bears them. In that light they are the least ugly of the wrinkles; yet wrinkles they are, and at best wrinkles are undesirable.

To remove crow's feet, dip the tips of the fingers in one of the good massage creams, and with the second and third fingers rub the area affected with a rotary motion, working from the corners of the eyes outward.

More disfiguring than the crow's feet, because of more ignoble origin and more difficult to erase, are the diagonal lines from the nostrils to the corner of the lips. They are known variously as the "bad temper lines," the "emotional lines," the "lines of discontent." Using the middle finger, the massage should begin at the corners of the mouth, and should end where the lines end, at the nostrils. This movement should also be a rotary one. It should be deeper and firmer than that about the eyes.

The third of the wrinkle areas, and the one in which the wrinkles first appear in most faces, is the forehead. One of your American women doctors said that the signs upon the forehead are unmistakable and infallible ones. "When a woman has three transverse lines across the forehead I know that she is twenty-seven," said this woman physician. "When she has two vertical lines between the eyes I know that she is forty-five." This is interesting, but untrue. I know half a dozen women of fifty who have neither of these groups of telltale lines.

In massaging the lines of the brow, remember the general rule for massage. The movement must be in contrary direction from the line. For instance, the vertical lines between the eyes must be treated by the second finger of each hand and must be rotary and upward, branching above the eyes with a gently diminishing motion to the right and left toward the temples. The transverse lines, forming as they do by a creasing of the skin from bottom to top, should be massaged by a rotary motion from the bottom to the top of the forehead.

The fourth of the danger zones is that in front of the ears. The vertical lines in front of the ears are believed to betoken advancing age. Yet, like those about the eyes, they are misleading. They sometimes appear on the faces of infants. The manner in which the ear is set accounts largely for the presence of these wrinkles. If it is set out from the head prominently the skin is loose in front of the ear and falls readily into wrinkles. If the ear sets close to the head the skin in front of the ear is drawn taut, and the so-called age-betraying wrinkles never appear. To check this fold of skin is almost impossible if the ear stands out from the head. To retard its deepening, use the middle finger for massage, and with deep, firm motion push slowly upward toward the top of the ear.

The lines on the neck behind the ears distress some women. To correct them, massage with the first and second and third fingers deeply upward toward the hair.

Massage of the body is prescribed by many physicians for nervous disorders, for defective circulation and for reduction of flesh, for insomnia and other disorders. While invaluable, it should only be given by a skillful masseuse, preferably one recommended by a reliable physician.

Of all systems of massage the Swedish is regarded as best. Its operators must study their art for two years.

If a woman be thin this massage emollient is agreeable and adds to her weight:

Oil of sweet almonds, 6 ounces; oil of bitter almonds, 20 drops; balsam of tolu, 4 grams; benzoin, 4 grams; essence of orange, 6 drops; essence of cajeput, 6 drops.

If the patient be plump, talcum powder is the only aid to the hands of the masseuse required.

The beautiful woman has points. Let us enumerate them: A figure graceful in outline, not too thin, nor too fat. A face that is fascinating, and by fascinating I mean interesting. But to make it interesting it must have what? Features that are well proportioned, let us say regular. They must seem to belong to one’s own face and no other. The nose must not be too large nor too small, but just large enough for the face in which it is set.

[Illustration: PAULINE FREDERICK Painters and sculptors agree in giving her high rank among the most beautiful living women.]

How to keep the lines of that face as good as they were at the beginning, or better? It is most important. The nose should be massaged--intelligently massaged. The owner of the nose herself can do it quite as well if not better than any other.

If the nose is too broad, she should massage it delicately toward the point. If it is too sharp, she should massage it away from the point to the flare of the nostrils, always with the merest points of the cushions of her fingers. To keep its normal whiteness it should have often, at least once a day, a hot compress of cotton dipped in rosewater or other distilled water, spread upon it. And after that there should be a dash of cold water upon it to close the pores.

CHAPTER VI

WHAT TO DO FOR THE FEET

The beautiful foot is that of the baby. It is beautiful because it is natural, unmarred by ill-fitting, cramping, distorting shoes.

Just in so far as the foot has departed from its original shape and habit is it less than perfect. It is hard, indeed, to find a beautiful foot. The story is told of a New York sculptor who, searching for a perfect foot, dismissed three thousand models who were applicants for the honor, declaring that there was not one beautiful foot among them.

By the established modern standard, the foot should be neither small nor large, though it is preferable that it be small rather than large. The tiny foot of a large woman is absurd. It suggests deformity. So does the short foot on the tall woman. The foot should seem to belong to the woman, not to have been loaned to her for the occasion. Like her hand, it should seem to be in perfect harmony with the rest of her body. If the owner be plump, the foot should not be thin. If she be thin, the foot should not be plump.

It should be neither bony nor too fat. The bones should be well covered, but their outline should be plain, enough to give a certain distinction called “character” to the foot. The toes should spread comfortably apart, yet there should not be unseemly spaces between them. The spaces should be slight and even like those between regular and well-kept teeth. The skin should be smooth and pinky white. The nails should be strong but smooth and semi-transparent and delicately pink. Above all, there should be no blemish, no disfiguring corn on the small toes, no enlargement of the joints, nor bunions, no calloused spot upon the sole. The

high-bred foot lies, according to existing standards, not flat upon the ground, but rests upon the heel and front part of the sole, so that a rill of water may easily run under it. To correspond with this natural bridge, there must also be an arched instep.

This is the standard. Now how to achieve it. First, wear shoes that are large enough and let them be of soft, pliable leather. Large enough, I said, but not too large. The foot that slips about in large shoes is as likely to get callous disfigurements as the one that is pinched. Heavy leather and thick soles have no place on a woman's delicate feet. The stiff, unyielding boot may be all right upon the masculine foot, and it may keep more perfect upon the inch-thick sole, but the skin of a woman's foot is too tender for this. The leather should be close but fine, the soles of medium thickness. But I cannot lay too much emphasis upon the need of a straight, even heel on the shoe. The heel is to the shoe what the cornerstone is to the house. It is quite as necessary that it be well laid, straight and secure. The crooked heel threatens the health as the insecure cornerstone the security of the house.

The run-down heel disturbs the adjustment of the internal organs. It pushes some of them close upon each other, draws others away from their natural support. It destroys the balance of the foot, causing blisters and callous spots. It throws the weight where it should not be, doing violence to the center of gravity.

Watch your heels as closely as you should the running time of your watch. When the bottoms of the heels disclose an inclined plane at the back or the sides, you will find a corresponding blister or newly formed callous spot on the sole. Your ounce of prevention is sending the shoes to a cobbler the moment you see the hint of crookedness in the heels. They can be planed or built up to their former evenness at very slight expense. The money spent thus is much less than the fee of a chiropodist that you will save.

Having formed the habit of wearing comfortable shoes--and let me say here that American shoes are the best and that I always wear them--see that the feet are released often from their prison. Even the best pair of shoes is a prison. In your own room wear the Japanese sandals that protect the delicate soles from the floor, but that leave the toes free to lie loosely apart, though they are secured by strong cross bands. These give the muscles of the feet a chance to relax. They are much better for this purpose than the felt slipper or shoe, which is too closely woven to permit proper ventilation.

The feet, like that other extreme of the body, the hair, need sunlight. Think how little the poor, imprisoned feet get. They need air. How little of that they get.

Well-shaped feet are so much rarer to-day than they were in the days of the Romans and Greeks, mainly because we imprison them in unventilated, sun-forbidding shoes instead of wearing the sandal of the ancients, which gave the feet the light and air they need.

It is unfortunate that the arbiters of fashion have not seen fit to condemn modern shoes in favor of the ancient sandal. More harm is done to the feet by the present-day footwear, than is done to the hair by rats and puffs or to the vital organs by tightfitting corsets.

Some years ago it did become the fashion for children to wear sandals, but their elders were not wise enough to follow their example. But if you cannot wear sandals yourselves, there is no reason why you shouldn't have your children wear them, for it is even more important that the child's feet be properly taken care of than the adults.

In early life, the bones are naturally soft and may be readily forced out of their normal shapes by any considerable exterior pressure. It is obvious that to maintain the proper contour of the child's feet, the sandal is much more satisfactory than the shoe. The former permits the feet to be flat on the ground and spreads the toes, the latter crowds the toes and compresses the whole foot.

And adults can improve the condition of their feet by wearing sandals in the house, even if prevailing fashion does not permit of their wearing them out of doors.

To be healthy, the feet must be kept scrupulously clean. So much are they exposed to the dust of the streets, especially by those who wear low shoes, that they need more than the perfunctory share of the morning plunge or shower. They should be bathed every night in a foot-tub containing warm water. If the feet be tender, the water should contain borax in the proportion of an ounce to a gallon.

Warm salt water is also very easeful for tired feet, especially useful for reducing the congestion in swollen feet. This powder, sprinkled into the warm bathwater, affords great relief:

Borax (powdered), 1 ounce; sea salt, 1 ounce; alum, ½ ounce. Use one teaspoonful to a gallon of water.

For tired, swollen feet, lemon juice, sprinkled freely into the water, is a means of alleviation. An easier way to apply it is to cut a lemon in half and rub the soles of the feet with it.

Calloused spots may be removed from the sole by planing off the rough surfaces with pumice stone.

English women give ease to their feet after a long walk by bathing them in an infusion of rosemary leaves. Steep the rosemary leaves, a half ounce to a gallon of water. When cool, bathe the feet for twenty minutes in the mixture, adding warm water now and then, as the water in the foot-tub cools.

For feet inclining to excessive perspiration a powder made of these ingredients should be used in the footbath:

Tannin, 60 grains; alum, 2 drams; lycopodium, 6 drams. One teaspoonful of the powder to a gallon of warm water is sufficient.

Sensitive feet are much relieved by this remedy, which is popular in England:

Rosemary leaves, ½ pound; juniper berries, 3 ounces; dried mint, ½ ounce. Boil in three quarts of water.

Corns are merely hardened portions of the skin usually appearing upon the top of the toes. Each speaks loudly of pressure by shoes. No Indian ever had a corn until he began wearing the white man's boots. Corns and bunions are the record of the fact that the shoe, as many wear it, is an instrument of torture. If the corns be new and not deep-seated, they can be removed by self-treatment.

Soak the feet from fifteen to twenty minutes in warm water, softened by a few drops of violet ammonia, or of benzoin. Bind a slice of lemon on the toes, tying it securely with a bandage of white muslin. If the corn responds naturally to the treatment it should be so loose after three or four applications that you can push it out by gentle friction with a towel. Never use your finger nails in extracting a corn, no matter how loose it seems. Blood poisoning might result.

If the case is more obstinate, this, applied with a small camel's hair brush should be quickly efficacious:

Collodion, 4 grams; ether (65 per cent.), 2 grams; alcohol (95 per cent.), 1 gram; tincture of Cannabis Indica, ¼ gram; salicylic acid, ½ gram.

Less expensive is this:

Collodion, 1 ounce; salicylic acid, 1 dram; fluid extract of Cannabis Indica, 1 scruple. Apply several times a day until the corn is soft enough to be scraped away.

If the corns are of the "soft" variety that grow between the toes, absorbent cotton powdered with tannin or alum may be inserted between them. Ring plasters to protect the corn from further irritation by the shoe have their friends and foes. I think it much wiser to remove the pressure permanently by abandoning the shoes that caused it.

Bunions, or enlarged and inflamed joints, are the greatest affliction to which suffering feet can be subjected. A new broad pair of shoes with low heels is the best remedy. To assist this remedy, the joints may be painted three times a day with this simple but strong bunion lotion:

Tincture of iodine, 2 drams; carbolic acid, 2 drams; glycerine, 2 drams.

A dainty foot powder should be on every woman's toilet shelf or table, especially if her feet perspire freely. An excellent one is made like this:

Florentine orris powder, 100 grams; starch, 100 grams; alcohol, 10 grams; phenic acid, 5 grams. This should be sprinkled on the foot before dressing it, especially throughout the summer.

And here is still another foot powder which I have used for a long time, sprinkling a half ounce of it into a foot tub holding two gallons of water, or dusting my feet with it after the bath:

Powdered alum, 1 ounce; powdered boracic acid, 2 ounces; talcum, 4 ounces; starch, 6 ounces; a few drops of perfume at pleasure.

This yet simpler powder is much used for perspiring feet:

Powdered orris root, 1 ounce; powdered alum, ½ ounce; rice powder, 3 ounces.

The nails should be cut square across, except when the formation of the toes, acquired by close pressure of the toes upon each other, demands that the nail be cut round to adapt itself to the shape of the toes.

At the first sign of an ingrowing toe nail each of two simple remedies may be used. The corner of the nail at the side where the toe is inflamed may be gently lifted and cotton thrust beneath it to relieve the pressure. Also at the middle of the upper edge of the nail a tiny V may be cut. Nature in extra efforts to heal this breach in the nail withdraws her forces from the irritation of the side of the toe.

Light massage by a skillful masseuse is greatly beneficial to tired feet. Dancers, pedestrians and female cyclists have used this unguent, rubbing it well into the muscles and about the joints, to make them more flexible:

Portugal extract, 1 ounce; rosewater, 1 ounce; brandy, 1 gill; olive oil, 3 ounces; mutton tallow, 4 ounces; virgin wax, 1 ounce; ambergris, ½ grain.

Walking barefoot in the early morning is still a fad of many society women and actresses and singers who have regard for the health of their feet. Besides the beauty of the foot and the elastic carriage so secured, walking with bare feet upon the bare earth is believed by many physicians to be very beneficial in certain cases. It is recommended also as a tonic for the nerves.

A good exercise to develop the elasticity of the foot is to sit with the feet scarcely reaching the floor, and press the fore part of the sole upon the floor. This also strengthens weak ankles.

No woman is ever pretty while her feet hurt; and a horrid male person has been ungallant enough to say that the awkwardest thing in nature is “a woman with a sore foot.” That he didn’t exaggerate, we must admit.

What shall we do to stop this wearing of beauty, this most excruciating of the minor physical ills? We should first look to the cause.

Is the skin between the toes cracked and sensitive? It is possible that this is a symptom of a uric acid condition. See your physician and let him determine whether it is so. If you have joined the great army of those who have the uric acid diathesis, be treated accordingly. If the cracks between the toes are caused by the feet being excessively hot, either of these should complete a cure in a short time:

Spread zinc ointment over the cracked surfaces; or, powder them thickly with Fuller’s earth.

If the feet are bathed every night before retiring in tepid water into which a little borax or common table salt has been sprinkled, there is little likelihood of sensitive, swollen feet, or of hardened or calloused portions on the feet. As the evening foot bath is a preventative, so is it a cure for such conditions, unless they have reached an extreme stage. If so, after carefully drying the feet--being careful to dry them thoroughly between the toes so that no soft corns will form there--rub the swollen portions of the feet gently with witch hazel; or the hard, calloused portions with olive oil or cold cream.

Keep several pairs of shoes so that you need not wear the same pair on two successive days. Wear a different pair of hose each day, turning wrong side out and leaving to air the pair that you have worn the previous day.

If the feet perspire this remedy is a good one--apply it by dusting the feet with it:

Borax, 10 grams; starch, 10 grams; salicylic acid, 3 grams; powdered alum, 5 grams; talcum powder, 50 grams; naphthol, 5 grams.

This simpler preparation can be applied with a camel’s hair brush:

Distilled water, ½ pint; bichromate of potassium, 1½ drams; essence of violet, 1 dram.

The masculine habit of resting the feet upon another chair than the one occupied by the sitter has its origin in the instinct of self-preservation. The blood flows too freely into the legs and feet that remain too long in a suspended position, engorging the veins and causing discomfort. It is this condition which men seek to relieve by placing their feet on desks and chairs. It is a habit which women may well imitate when alone--at least to the limit of the height of a chair seat. The “long chair” of the French meets the need of allowing the legs to lie on a level with a portion of the body while the upper part is in a sitting posture.

Rest the feet by wearing larger shoes and only cotton stockings. Wear sandals without stockings in your room on warm days.

CHAPTER VII

THE PROPER CARE OF THE MOUTH AND TEETH

To be beautiful one must have an ideal of beauty and strive always to reach it. Wishing to make and keep the mouth beautiful, we must have ever in our minds an image of a beautiful mouth.

What must a mouth be to be beautiful? Ideals about beauty differ greatly, but there can scarcely be any difference of opinion about the attributes of an attractive mouth. It must be well shaped.

It must be red, but not too red. The teeth must be, or seem to be, perfect.

If I were harsh enough to criticise American women, I should say that their eyes are beautiful, but their mouths are not so beautiful. I should say that their lips are too thin. I should say also that their teeth are not perfect. I should qualify this by saying that I am speaking of the average, not the exceptional, American woman.

The reason for this fault of lips that are too thin and too straight lies chiefly in character, and there we have a paradox, for it is not a fault of character. American women have immense self-reliance, tremendous decision, and these are written in lips that might be carved from pink marble, straight, fine, unyielding. I would not change those admirable traits of character, but I would use massage to relax the muscles about the lips and remove that drawn expression.

The pleasing mouth has lips that curve from thin outer corners to a ripe fullness at the middle. The sweep should be upward to a fine cleft at the middle of the upper lip. A deep cleft just above the upper lip is one of the recognized marks of beauty. The lower lip should be straighter and not so full as the upper. Much has been said about the beauties of the lips, but nothing has been said more illuminative than the phrase “Cupid’s bow.”

Study the gentle sweep of a bow, held in place by a cord. It adheres to the rule, “Curves are the lines of beauty.” The curve is soft, tender. It seems to be the blending of countless curves. So the mouth. I once saw the mouth of a cruel woman described as being “like a slit in a stone wall.” I thought the phrase apt.

I believe in allowing the mouth to take care of itself. It is its surroundings, its environment, so to speak, that is important. Look to the lines from nostrils to lips. See that they are removed by massage. Massage restores circulation. Massage is like a system of irrigation for waste land. Creases are caused by lack of circulation. The muscles that hold the mouth in a firm line are thread-like, one just above and at the sides of the lips. It is most important to keep these taut by massage.

As to color, I have said that the lips should not be too red. The normal lips should be the same color as the gums, and has not your dentist said to you, “Your gums are too red, are not healthy”? So the lips should be a deep pink, or a light red. Not blood color, but three shades at least lighter than a stream of arterial blood. I make this distinction because venous blood may be bluish, and far from a model for the healthful color of the lips.

An Italian authority on beauty said the beautiful mouth must always be open enough to show five teeth. This is attractive, but not hygienic. The teeth are to the beauty of the mouth as important as the keystone to an arch. Without the keystone there can be no arch. Without lovely teeth the beauty of the mouth does not exist. The lips are a promise of beauty. The teeth are its fulfillment.

The teeth should be regular. They should not be crowded together, and there should be no aggressively noticeable spaces between them. They should be white, or seem white. The unromantic truth is that teeth are never white. They are of three shades, blue, yellow and gray, always one or the other. But in contrast with the lips they look white, and the more vivid the lips the whiter do the teeth look in contrast. Which is the reason, I suppose, that I have seen women with frightfully overcarmined lips.

Now, how to make the mouth or keep the mouth well shaped, red but not too red, and teeth to be or look perfect. The time to train our mouths to beauty is in our infancy. Our mothers should begin the work, and when we have reached years of intelligence, we should carry it forward.

If an infant’s mouth is too large it can be trained to lesser size by tender pinching of the corners. This makes the line at the corners almost indeterminate, and diminishes the size. Need I tell any mother that this must be most gently and tenderly done? Also train

the lips to deepen their beauty cleft by pushing the middle portions together with the first fingers. This light pressure four or five times a day, when you are dressing the child in the morning and undressing her at night, will marvelously refashion the mouth. I knew a Parisian mother who not only made over her child's mouth, but also the nose into good lines by this light, discreet pinching.

If your mouth is defective, improve the shape of your lips by avoiding careless habits. Many pretty women are disfigured by crude, careless habits of mouthing their words, of chewing their lips, of ridiculous labial contortions while they talk.

To correct them, practice in talking or reciting before a mirror. Note whether you draw down the lips while you speak. Note whether you catch them between your teeth and nervously chew them. Observe whether, while you make a short speech, longitudinal lines form on the upper lip. Notice whether your smile is simple, natural, unexaggerated, or whether your mouth widens vacuously, or draws into a prim resemblance to a buttonhole when you smile. When you have determined whether you have any of these bad habits, determine to cure them, and do so. There is but one way to cure them, and that is by remembering your fault and avoiding it.

The lips should be lightly massaged before falling asleep. For that massage this is my favorite pomade. You will observe that in no preparation that I advise for the lips is any camphor. I dislike camphor for the lips because it is an astringent, and the mouth is too much inclined to pucker into unlovely lines without its aid. Try this:

Oil of sweet almonds, 125 grams; white wax, 28 grams; spermaceti, 28 grams; oil of bergamot, 1 gram; oil of geranium, 2 grams.

This softens the lips, effacing the tiny lines that form in the lips, destroying their smooth surface, during the day. It can be varied by another and simpler remedy:

Hydrated glycerine (50 per cent. water), 60 grams; rosewater, 20 grams.

Do not use glycerine alone on the lips nor on any other surface of the body. It is too drying. It has the power to draw moisture from the skin, and that moisture should by replaced by the water with which the glycerine is mixed.

Leaving the shape, we come to the color of the lips. Preserve that by keeping the bodily health good. If the circulation is defective the lips will be pale. If we become anæmic, pallid lips will be one of the first signs of our state. To make them healthily red improve the tone of the system by two means. Be sure to sleep enough. You may need eight hours or nine. You yourself know which. Take it.

Eat nourishing food. Eat often and lightly. That is far better than to eat seldom and heartily. Better five light than three heavy meals a day. Eat of meat sparingly, for most meats are hard to digest. Once a day, and that at dinner, is often enough. But depend greatly upon vegetables and eggs. Eggs have much iron in them. So, too, have string beans, spinach and beets. Milk, too, is an excellent builder of new tissues.

If, after a fortnight, your lips are still pallid, try the iron injections I have before recommended. Do this under a physician's directions and you will surely be vastly benefited.

Mouth mannerisms are leaks of beauty. Self-conscious young women draw down the corners of their mouths when they talk or when they smile. They twist one corner of the mouth downward, making the mouth one-sided. They even suck the lips inward, spoiling the contour of the mouth. They rub their faces with nervous fingers. They elevate one eyebrow and pull down the other. They twist locks of their hair. They play with folds of their gowns, or with their desk ornaments. It is only the deeply learned lesson that it is vulgar to play with articles on the table that keeps them from drumming with their knives and forks or twirling their plates.

This is deplorable, for it not only mars their beauty, but shows an utter lack of inward calm. They must get into a state of peace, must harmonize inward with outward conditions. A dozen times a day they must say to themselves and must obey their own command: "Peace, be still."

Talk, if you will, but don't talk unless you have something to say. Believe me, you can be interesting though silent, by being an interested listener. Wild, aimless, excessively excited talking is one of the biggest leaks of beauty.

The mouth, if too large, may be lightly massaged by using the middle fingers of each hand to coax it toward the greater fullness at the middle and less at the corners. If it be too small, rotary massage from the corners of the lips will tend to widen it.

If the chin be too strong, the jaw too heavy, as it is sure to be in these latter days of new equality, the fact can be rendered less glaring by dressing the hair well forward above the forehead, so that there will be a semblance of brow and chin being of equal

weight, and the face seem to be well balanced. If the chin is too weak the hair should be well drawn back, so that the strength of the brow will seem to make up the character deficit.

For lips that chap easily and always have a parched look let me advise that this pomade be applied every night, freely massaged into the lips:

Cocoa butter, 24 grams; white wax, 4 grams; oil of rose geranium, 1 gram.

This should relieve an ordinary case. If it be an obstinate one, suppose you try this remedy prescribed by the famous Dr. Vaucaire, whose commandments are the decalogue of beauty-loving Paris:

Castor oil, 6 grams; cocoa butter, 20 grams; oil of birch, 4 drops; extract of catechu, 2 grams; essence of star anise, 10 drops.

To make rough lips smooth try this:

Oil of sweet almonds, 1 ounce; spermaceti, 1 ounce; white wax, ¼ ounce; oil of rose, 6 drops. Melt together slowly, then work into a firm cream.

The gums should be of a healthy red. If they look pale massage them gently for five minutes several times a day with this compound:

Woundwort water, 100 grams; horseradish extract, 12 grams; oil of cloves, 1 drop. Dilute with an equal quantity of water.

The wholesome woman tries to keep her breath as “sweet as the kine’s,” recalling the exclamation of Byron. She keeps a jar of bicarbonate of soda on her bathroom shelf and takes a teaspoonful in a glass of water whenever needed. She always drinks two or three glasses of cool water slowly on rising. This is because when the stomach is in the tubular shape that it is in the morning it lends itself easily to the work done by the water, of cleansing the stomach for its work of the day. To correct acid conditions of mouth or stomach she takes a couple of unsweetened charcoal tablets now and then, and this is her favorite mouth pastille:

Unsweetened chocolate, 1½ ounces; white sugar, ½ ounce; charcoal powder, ½ ounce.

These are more easily taken if mixed to the consistency of paste by the addition of dissolved gum arabic, cooled and cut into tablets.

For the care and preservation of the teeth four things are essential. They are: Proper diet, proper tooth brush, proper tooth powders or pastes, and proper mouth baths.

But beyond any doubt the first safeguard is to have a reliable, skillful dentist--if you can make sure of finding one. One may go on for years with false confidence in a dentist before one finds out her sad mistake.

I go to a dentist once a month to have my teeth examined. No one should let more than three months at most pass without a visit to the dentist for an inspection of the teeth.

The best dentist is none too good. The careless or ignorant or lazy or dishonest dentist may cause irreparable damage. And the saddest part of it is that we are at the mercy of the dentist, because we cannot know whether his work is good or bad until the damage is done.

There often come on the teeth, particularly between them where food is permitted to lodge, small dark stains, which really are the first warnings or premonitory signs of decay. If allowed to remain, the enamel eventually disintegrates, and we have a cavity, which must then be excavated and filled. Before this discoloration has advanced to an actual breaking down of the tooth structure, it may very properly and successfully be removed or polished away by the dentist’s engine and the sandpaper disc used for this purpose and for smoothing gold fillings.

The honest dentist will do this, and restore the tooth to its original color and soundness, after which it may be, with care, indefinitely preserved, but the unscrupulous dentist may, of course, construe this suspicious-looking spot as caries, and he may wickedly cut away sound tooth surface, fill in with the customary unsightly gold or amalgam, and the unsuspecting victim pays the bill and departs none the wiser. Of course, in front teeth it is especially a misfortune to make a cavity where it could have been avoided.

Let us consider now the diet. We must avoid extremes. The English girl’s answer to the question, “Why do you have such beautiful complexions?” might as well have been made to another query: “Why do English girls have such beautiful teeth?” The girl replied:

“Because we never eat anything very sweet or sour, nor anything very hot or cold.” That is an excellent rule.

Whoever follows it will adopt an admirable dietary. Also live if possible in a region whose soil is strongly impregnated with lime.

That its soil is so strongly impregnated with lime is the reason why the Bluegrass region of Kentucky is as famous for the beauty of its women as of its horses. Much lime in the soil means much lime in the products thereof, and whoever eats of these products has strong bones and correspondingly strong teeth. But we may not all live in Kentucky, and unfortunately there is not enough lime soil to extend over the world. So we must make up for this lack by careful attention to our diet.

Let me explain why the diet is of so great importance. Those foods which contain lime strengthen the teeth. Fifty-four and seven-tenths of the composition of the teeth is phosphate of lime, when they are in normal condition. To get as much lime as possible into the system, and so into the teeth, is as necessary as to have as much iron as possible in the framework of the house. The iron in the framework of the house will resist fire. The lime in the teeth will prevent their softening and decay.

Therefore, gluten and whole wheat bread and the cooked cereals, instead of cakes and white bread and sweets, should be eaten. These should be supplemented by various preparations of phosphates to introduce lime into the system. A simple lime water, which can be prepared by any housewife or any intelligent employé of a housewife, is one of the best of these preparations:

Clean, unslacked lime, 1 teacupful; water, 2 quarts. Put the lime into a pitcher and pour the water over it. Stir the mixture, or shake it until it looks like milk. Then pour off the water. Fill the pitcher again with pure water. Again stir or shake thoroughly. Tie over the pitcher a piece of muslin to keep out the dust and possible floating germs. Let it stand in a clean, cool place until the water is clear. Pour the clear portion into clean, glass-stoppered bottles.

Another method is to use a tablespoonful of lime water in a tumbler of milk.

If the teeth are soft from deficiency of mineral salts or sensitive from the presence of excessive acids the dose can be increased to two or three tablespoonfuls.

It is well after eating acid fruits to rinse the mouth carefully two or three times with lime water or any alkaline mouth wash. Or when the teeth have been irritated, or unpleasantly affected, or the gums irritated by a food or medicine to which they are unaccustomed it is well to rub precipitated chalk about the necks of the teeth and between the teeth. It is well also to rinse the mouth with milk of magnesia at night before retiring.

Again let me suggest that diet is of immense importance for two reasons. If the diet be an unwise one it may create an excess of uric acid, which makes itself manifest in the mouth and causes the teeth to decay about the necks, that is, the portion enclosed by the gums, a state to be avoided, for the cavities thus formed are hard to reach and are the most painful to be operated upon by the dentist.

Again, the diet is important because if there is an undue fermentation or any other unwholesome condition in the stomach the gases and acids arising from these discolor the teeth.

Therefore, avoid, as I have said, articles of diet that are very sweet or very sour, and articles of drink that are very hot or very cold. For example, do not eat candy, pastry, puddings, except those consisting chiefly of fruit; ices, pickles or sour oranges or grape fruit. Do not drink sour lemonade, nor limeade. Avoid ice water or very hot tea or coffee. I am extremely careful about my diet, quite as much for the care of my teeth as for my complexion.

As soon as I rise in the morning I place my tooth brush, which should be soft and shaped to fit the teeth, in a mug of hot water. I let it remain there for a half hour, until I have had my bath and my alcohol rub. This hint I received from my dentist, who said that it would make the bristles soft, besides swelling them so that they would fill the spaces for them in the brush, and thus prevent the bristles from loosening and detaching themselves from the brush and irritating the gums.

Always use a good tooth powder or paste which a reliable chemist has analyzed and pronounced pure. Simple, pleasant and beneficial to gums and teeth is this:

Camphor gum, 1 ounce; precipitated chalk, 5 ounces; pulverized orris root, 3 ounces.

A good variant of this is the following:

Precipitated chalk, ½ pound; powdered starch, ½ pound; powdered orris root, ¼ pound; sulphate of quinine, ¼ dram.

One of my own favorite powders is made according to this formula: Carbonate of magnesia, powdered, 3 ounces; powdered orris root, 1 ounce; powdered sugar, 1 ounce; castile soap, ½ ounce; powdered precipitate of chalk, 10 ounces; oil of roses, 25 drops; oil of lemon, 5 drops; oil of wintergreen, 5 drops; tannin, 15 drops.

I recommend also this as helpful and agreeable:

Precipitated chalk, ½ pound; powdered borax, ¼ pound; powdered myrrh, ¼ pound; powdered orris root, ¼ dram.

Another simple and effective preparation is this:

Powdered chalk, 2 ounces; oil of peppermint, 2 drops.

A good antiseptic powder for occasional use I have found to be this:

Bicarbonate of soda, 1 ounce; cinnamon, 1 ounce; oil of cinnamon, 2 drops.

If my teeth are discolored I brush them thoroughly with this powder:

Sugar of milk, 200 grams; powdered catechu, 3 grams; oil of peppermint, 4 drops; oil of anise, 4 drops; oil of orange flower, 4 drops. Pour into the sugar of milk a few drops of alcohol. Add the catechu, stirring them thoroughly. Sift them through bolting cloth and sprinkle the oil of peppermint, the oil of anise and the oil of orange flower into the powder.

Another which is less expensive, and is also excellent, is this:

Precipitated chalk, 500 grams; pulverized orris root, 250 grams; pulverized camphor gum, 12 grams; alcohol (95 per cent.), 10 drops. This should be sifted through bolting cloth to remove lumps that might irritate the gums.

It has always been my habit to use powder only once a day and that in the morning. I think it enough, because too much tooth powder in time wears away the enamel. Yet my dentist tells me that the best time to use tooth powder is at night, because the salivary glands, being quiet during sleep, when we do not talk or eat, do not then secrete the saliva, whose flow has a cleansing action.

After each meal I use dental floss, drawing it between the teeth to remove any particles of food that may have lodged between them. Hard toothpicks are liable to crack the enamel. Also I give the mouth a bath, that is, I thoroughly rinse it several times with a good mouth wash.

Of preparations for liquid dentifrices and mouth baths there is no end. This, “the bath of roses,” is my favorite, and I rinse my mouth with it after each meal and before retiring:

Tincture of orris root, 8 drams; spirit of roses, 8 fluid drams; alcohol, 95 per cent., 8 fluid drams.

An agreeable preparation for a mouth bath is made of:

Powdered borax, 3 drams; honey water, 2 ounces; castile soap (powdered), 1 ounce; warm water, 1 pint; oil of cloves, 2 drops.

Dissolve the powdered soap in the warm water. Add the other ingredients and shake well.

Either of the following washes will be found excellent for the teeth:

Tannic acid, 1 ounce; oil of wintergreen, 1 dram; powdered orris root, 4 ounces; alcohol, 4 ounces; water, 4 ounces.

Tincture of orris root, 1 ounce; tincture of musk, 4 drops; oil of rose, 2 drops; oil of neroli, 4 drops; oil of peppermint, 4 drops; oil of spearmint, 4 drops; oil of ylang ylang, 1 drop; alcohol, 3 ounces; water, 8 ounces.

Here is one which, besides being agreeable, has a medicinal value in being a disinfectant:

Thymol, 3 grains; alcohol, 3 ounces; benzoic acid, 40 grains; tincture of eucalyptus, 3 drams; essence wintergreen, 5 drops.

Easily obtainable, too, is this and very soothing to irritated gums:

Permanganate of potash, 10 grains; distilled water, 1 ounce.

Another simple mouth wash which I have frequently employed with good results is made as follows:

Chlorate of potash, 2 drams; rosewater, 6 ounces.

For a mouth bath after a meal a solution made by adding a tablespoonful of bicarbonate of soda to a tumbler of water is useful.

Use dental floss more and the toothbrush less. The toothbrush should be soft and should be shaped to adapt itself to the teeth. It should slant toward the front, with a tuft on the end so that the bristles can work their way into all the crevices between the teeth.

I am glad that toothpicks have come to be classed with vulgar things. A member of Parliament at a dinner in London played nervously with his toothpick and thrust the end of it into his finger. The toothpick had harbored some dangerous microbe, for the statesman had to have two fingers amputated. The danger of infection from toothpicks is great. Dental floss being protected from vagrant germs by its casing, and the end being cut off as soon as used, is much safer, besides being less irritant to the tender gums.

If the teeth are not straight, have them straightened. If there are wide spaces between them have them drawn closer together. Dentists can do this by fastening rubber bands about the neck of the teeth. It is tedious and painful, but it is worth while. For a tiny space, but an undue one between the teeth, may change the natural expression of the face. I know an American statesman, whose face is of the strong, noble lines of a statue of granite, but who takes on a fatuous expression when he smiles, because there is a considerable space between his two upper front teeth. After the teeth are drawn into their proper place, they are secured by small bands of gold or by a rod at the back of the teeth.

If the teeth are permanently discolored it may be because you need a dentist’s services. It is well to call on him at least every three months. Every two months is still better. His examination will show any fault in the teeth that may be a tiny one, but which if neglected for three months longer would be troublesome. Frequent visits to conscientious dentists are best for your teeth and best for your purse.

The teeth are the most important of the appointments, the furnishings, so to speak, of the mouth. They must be kept perfect at all costs of care and forethought. But they, like all portions of a woman’s body, must be delicately treated. Tooth powder should not be used more than once a day. And that in the morning. For the rest dental floss and a delicate liquid dentrifice after each meal and before retiring.

CHAPTER VIII

DUTIES EVERY WOMAN OWES TO HER HAIR

It is Monday, and I note that my hair does not respond readily to the brush; that it lies lifeless under my fingers; that instead of being a live, bushy, glowing mass, it has diminished to a wisp scarcely larger than my two fingers. It is as though some witch in a rage had plucked it, hair by hair, from my head as I slept.

But that has happened too often to give me alarm. Once I wept over it. I thought that I was to become as the shiny-headed men that sit in the first rows of the opera and stare and stare. But that was long ago. Now I know when my hair shows these symptoms that it is dead, but only temporarily, and that with care I can resurrect it, make it live again.

With this lifeless condition of the hair I have always found two corresponding conditions of the scalp. The scalp is hot and dry. Also, the brushing reveals dandruff--light, fine and profuse. It is a condition that must be corrected.

First remove the dandruff. Hair cannot thrive when that fine, light powder lies upon the scalp, obstructing its pores. To rid one’s self of it the hair must be washed, not once but often. I resolve upon washing it every day for a week. I choose the time when I have had my bath. In the water I have dissolved half a cake of the best soap I can get. If upon analysis it is proven to be made of spermaceti all the better. I always have a new soap analyzed, as I do a new cold cream.

I part my hair, and, dipping a small brush the size of an ordinary toothbrush into the water, rub the parting vigorously. I part it again, and rub that parting, and the next, and the next, scrubbing it, as you say in this country, strenuously with the brush dipped in soapy water.

When this has been done I empty the bowl, and in a second water, in which the other half of the cake of soap is dissolved, I wash the hair again, but this time rub the scalp, not with the brush, but with my fingers. Then again and again and again, until the water is as clean as when it runs from the faucet, I rinse the hair.

Now comes the problem of drying it. The hair that is dried in the hot funnel becomes brittle and cracks. If it is dried by draughts of cold air its owner contracts neuralgia. It should be dried first by a brisk toweling. The towel should be rubbed quickly through the hair and upon the scalp, taking the first dripping stage of moisture from each of them. The rest of the drying should be done by the heat of the hands. With the tips of the fingers every bit of space on the scalp should be rubbed until dry.

As the scalp dries the hair dries, too. Last, that the hair may not hang together in matted strands, but stand fluffily, each hair for itself, there should be the last stage of the drying. This is the rubbing of the hair, strand by strand, between the hands. Even this one shampoo will prove that the hair that seemed to be dead is, after all, very much alive.

After the drying the hair should, of course, be brushed--adequately brushed. But there are curious ideas among women in this country as to what is adequate brushing. American friends of mine give the hair one hundred, even two hundred, strokes. I think this is too many. Excessive brushing drags upon the hair and loosens its roots. Forty strokes of the brush I believe to be quite enough. Less brushing, more massaging, is what is needed by all heads, especially the heads on which the hair is thinning.

After the forty strokes of the brush there should be massage. Dry massage always. If you begin with dry fingers you will find that your fingers soon become oily. The sebaceous glands yield their contents quickly to the pressure of fingers, and the released oil softens the hair and sets the tide of growth pouring into it.

It is well at this time to give the hair a sun and air bath. The hair is precious, a splendid frame for the face, and you can afford to give much time to saving it. Sit or stand near an open window. Let the sunshine pour its tonic into your hair. Let the air sweep through and about it. It will respond to the treatment as an invalid to his first drive after a long illness.

Let the hair rest as much as possible. Decline invitations, or, if you have accepted them, cancel the engagements. You can dispense with a few perfunctory meetings and greetings, a cup or two of tea, rather than with so important a part of your beauty as shining, healthful hair. Remain in your boudoir, with your hair loosened and hanging. When it is necessary to be visible to the world wear it in a somewhat different way, and use fewer hairpins.

On Tuesday I would use a different and more stimulating shampoo:

Pure liquid soap, 100 grams; carbonate of potassium, 20 grams; distilled water, 2 liters. These should be boiled until the soap is dissolved, then let cool. When cool add from 200 to 500 grains of tincture of vanilla or other favorite perfume.

A handful of this shampoo in a bowl of warm water will cleanse the hair of any dust it may have accumulated since Monday. The hair is now thoroughly clean. The next step is to stimulate it. For this purpose use the camomile mixture, made as follows:

Two handfuls of camomile; two quarts of water. Boil until the mixture is as black as after-dinner coffee. Usually fifteen minutes are quite enough. Pour it into two more quarts of cold water and place in a gallon jar.

Massage the scalp with it after the shampoo. This is a favorite preparation in France. There no grease nor oil is used on the hair.

To encourage the hair to grow an application of a good quinine mixture is a great aid. During the afternoon of the second day that I go into seclusion for my hair’s sake I massage the scalp lightly with such a tonic. Or I apply it before going to bed. Many of the quinine mixtures sold in the drug stores I have used with good effect, after having had them analyzed by chemists.

Here is a preparation which a friend becoming bald used to secure a splendid new lot of hair. Were I in so serious a state I might also use it:

Precipitated sulphur, 10 grams; alcohol (95 per cent.), 10 grams; distilled water, 50 grams; rosewater, 50 grams.

And here is another which, were my case radical, I would use:

Alcohol (95 per cent.), 100 grams; acetone, 100 grams; oil of cade, 10 grams; precipitated sulphur, 20 grams; pyrogallic acid, 2 grams; chrysophanic acid, 20 centigrams; bichloride of mercury, 40 centigrams.

On Wednesday I would do that which ordinarily I should do but twice or three times a year--I would singe the ends of my hair. Then again I would shampoo it with the preparation for which I gave the first recipe, and would again give it the tonic of air and sun bath.

And again I would use the camomile, but if one prefers to have the aid of the druggist here is a preparation that is much used in London with great satisfaction. I shall give it in the English measure:

Resorcine, 1 dram; chloral hydrate, 3 drams; sweet almond oil, 1 dram; chloroform, 6 drams; eau de cologne, 6 ounces.

On Thursday, if my hair is not showing great improvement, I may vary my shampoo. Here is an excellent cleansing one:

Extract of witch hazel, 1 pint; eau de cologne, 8 ounces; chloroform, 3 drams.

On Friday and Saturday I would repeat this shampoo, the massage and the sun and air bath.

By Sunday, with every morning a shampoo, a massage of the scalp for fifteen minutes--not long enough to irritate the nerves--and the sun and air baths and the repose, one's hair should be excellently vigorous. If the rigorous treatment should have caused it to be too straight I would encourage it to curl by the application of rosewater and gum arabic in these quantities:

Gum arabic, 100 grams; rosewater, 400 grams.

Always in brushing the hair the strokes should be backward, straight back, instead of to the sides, for in that way the hair is aided to grow low on the forehead, which is a most desirable mark of beauty.

Before retiring I always braid my hair in two loose braids. I never use curling irons when I can avoid it. Use them cautiously. Better not at all, especially if your hair have a natural wave.

If your hair persistently continues to fall out, it is probably because of a generally lowered tone of your health. I should then resort to iron or arsenic hypodermic injections under the direction of a physician. When I have suffered from nervous exhaustion I have always taken this treatment at a physician's prescription. I have found the iron particularly upbuilding. I would receive an injection every day for ten days, then rest three or four days, then begin again for another ten days until seven weeks have gone. Always at the end of that time I have felt rejuvenated.

And after my complexion my hair was the first to improve. Never attempt this without medical direction, I repeat. The injections of iron I preferred to taking it internally, thereby saving the teeth from the bad effects of the iron. Also the administering of medicines in this way prevents an unpleasant disturbance of the stomach.

If there be an unconquerable objection to the injections a physician will prescribe cod liver oil, or tablets containing quinine and phosphorus that are a tonic to the system.

If the hair be prematurely gray I should first take a general treatment for the system, hoping that the gray hair would fall out and a crop of natural color appear. Or if I could gain my own consent to dye my hair, I should go to a druggist's and ask for a safe solution of henna. This is the one hair dye which I can recommend. It is harmless, but its range of usefulness is limited for it only dyes the hair red. It is prepared like this:

Henna leaves, 1 ounce; boiling water, 2 pints; henna powder, 1 ounce. Place the henna leaves in a stone jar. Pour over them the water. Allow the liquid to stand undisturbed for twelve hours. Then strain and heat until it reaches the boiling point. To the liquid add the henna powder. Stir thoroughly and strain once more. The hair must be thoroughly clean when it is applied, so the best time to apply it is immediately after a shampoo.

But do not place too much reliance upon the henna. Look to the state of your general health and be sure to keep the scalp cool, clean and moist. If this is done the next crop of hair--for we raise new hair every three years, you know--may come in the former natural color and the former unwelcome gray may disappear before the new crop. Use a good hair tonic to bring about that condition of the scalp. This is one that has been long and successfully used:

Glycerine, 2 ounces; alcohol, 1 pint; sulphate of quinine, 1 dram; oil of cloves, ½ dram; oil of lemon, 4 ounces; oil of bergamot, 1 ounce.

This, too, deserves recommendation:

Castor oil, 1 gill; alcohol, 3 pints; tincture of cantharides, ½ ounce; borax, 2 ounces; water, 2 ounces; oil of lavender, 1½ ounces. Shake well before using.

The wholesome woman has thick, lustrous, clean hair. I am sorry to say that it is necessary to use this last commonplace adjective. But some women there are who neglect the hair until it does not deserve to be so described.

“She has such clean hair,” a man said to me of an American girl who is much admired. When I saw the girl I knew his appraisement was just. Her hair was clean. It was thick, light brown and slightly curling hair, just the sort that a careless person might neglect, saying, as I have heard women say, “Mine is the kind of hair that takes care of itself.”

But this girl’s hair was as clean as her radiant young face. One received the impression that her hair, as all the rest of her person, had as close neighbor the bath.

And so it is. Her hair being light, she washes it at least once a week in borax water, made by dissolving an ounce of borax in a quart of warm water.

Borax is somewhat drying, and if she finds her scalp growing too dry she massages the scalp twelve hours before the shampoo with this:

Oil of sweet almonds, 45 grams; essence of rosemary, 45 grams; oil of mace, ½ gram.

If the wholesome woman find her hair growing prematurely gray, and this she is not at all liable to do, for gray hair is a sign of anæmia, and from this the healthy woman rarely suffers, she makes her life more than ever wholesome. She lives out of doors the more. She takes more regular sleep and more nourishing food. She is more than ever punctual and thorough as to her exercise. And having done all these she may assist nature with this remedy, which her less wholesome sister has used with success, to arrest the turning gray of her hair:

Good claret, 30 grams; sulphate of iron, ½ gram. To use the cook’s parlance, “Bring these to a boil.” Keep in a well corked jar in a cold place and wash the hair with it after each shampoo. If necessary it can be used two or three times a week. Permit the mixture to dry on the hair.

Here is another wash that has proved successful when the hair was turning gray:

Sulphur, 2 ounces; bay rum, 8 ounces.

Sulphur to a degree strengthens the pigment--that is, the natural coloring matter of the hair. Use the sulphur in lumps, for it will not adhere to the scalp as will sulphur in the powder state.

If the case be beyond such relief a French dressing, which those who use it disdain to call a dye, is used by brunettes whose hair has turned prematurely gray:

White wax, 2 ounces; olive oil, 5 ounces; burnt cork (powdered fine), 1 ounce. The white wax and oil should be melted together over a slow fire. Add the burnt cork and mix well. The mixture should be applied to the hair as a pomade, and thoroughly brushed in.

Here is a good corrective for falling hair:

Oil of sweet almonds, 2 ounces; alcohol, 2 gills; aqua ammonia, 2 ounces; good whiskey or rum, 4 ounces; gum camphor, ¼ ounce. Shake thoroughly each time before using and rub thoroughly into the scalp. Massage your scalp well, so that you can feel the skin of the scalp move.

For a scalp that is too oily use borax or bicarbonate of soda in the weekly shampoo. A blonde of my acquaintance believes that the juice of one lemon used in the last rinsing water after a shampoo adds to the brilliance of her hair while also drying it enough to make it “fluffy.”

Allow your hair to be straight, if Nature planned it so. Find some becoming method of wearing it straight. If the ends have become broken and the hair is thin and uneven set about raising a new and stronger crop. But first prepare the soil for the new crop by cleansing your scalp with frequent shampoos, one every other day if necessary, and by using on it a good oil. Olive oil is an admirable agent for loosening and feeding a heat-dried scalp. Have the ends singed or clipped. Massage the scalp every day, unless it is too tender to endure massage that often. Irritating the nerves, which protest against such treatment, does far more harm than good. A few applications of electricity by a physician familiar with your case should stimulate the anæmic scalp.

A few years ago there were almost no good hair tonics. Now there are many. Almost any tonic containing a liberal amount of quinine is a good hairgrower. Here is one much used in Paris:

Oil of almonds, 6 ounces; oil of rosemary, 2 drams; oil of mace, 60 drops.

An excellent tonic for the scalp is:

Alcohol, ½ pint; oil of mace, ¼ ounce.

One that has many advocates is this:

Fluid extract of jaborandi, ½ ounce; glycerine, 1 ounce; sulphate of quinine, 10 grains; cologne, 2 ounces; rosewater, 10 ounces; bay rum, 2 ounces.

The wash that has tonic properties in addition to being an excellent cleanser is made as follows:

Precipitated sulphur, 10 grams; alcohol (95 per cent.), 10 grams; distilled water, 50 grams; rosewater, 50 grams. Apply it to the scalp as all other tonics are applied with the tips of the fingers or a soft brush, for instance, an old tooth brush.

This tonic will keep the scalp cool, clean and moist and help prevent the hair falling out:

Tincture of cantharides (alcoholic), 1 ounce; spirits of rosemary, 1½ ounces; rose water, 3 ounces; aromatic vinegar, 1½ ounces.

Parisiennes have recently been washing their hair in gasoline. Not because they believe that it will cause the hair to grow, but for the same purpose that it is used upon a spotted garment--to cleanse the garment and remove the spots. Also gasoline makes the hair soft and silken of texture, I am told.

I have myself used gasoline a few times on my hair, but always try to keep it away from the scalp as much as possible. I cannot believe that gasoline is good for the scalp.

I take the gasoline shampoo somewhat as I do the water bath for the hair. I wash it in a bowl of the gasoline, pour out the first bowlful and wash it through another, then another, until the last bowlful is entirely clean. Let as little gasoline as possible get to the scalp. But the shampoo is always taken on the morning of a clear day. Never do I have it done while there is a light or fire in the room. If I did, there would be no more Lina Cavalieri. Gasoline is most inflammable and one cannot be too careful when using it.

Never use vaseline on the hair, never, never. It is not harmful. It is merely useless. It no more makes the hair grow than would sprinkling flour over the face make it grow. It is derived from a mineral, and nothing of mineral origin causes the hair to grow. I never use grease on the hair. After the shampoo, once a week, I use the camomile lotion I have already described, rubbing it in carefully with the points of the fingers, and on no account permitting it to touch the face, because it will make the face yellow. This cleanses the hair and tones the scalp, promoting circulation.

Hair to be really beautiful should not lie in heavy, sticky bands, but should stand out hair by hair, as separate as the down of a little chicken. To acquire this use ten drops of ammonia sprinkled in the camomile. It must be added after the mixture has boiled and cooled, otherwise the ammonia will evaporate.

This is the favorite preparation now used in France. No beauty nor fashionable woman ever uses oil upon her hair. By keeping it frequently massaged and thoroughly brushed she permits it to develop its own oil.

The Egyptian women have the most beautiful hair in the world. This they owe to henna. Sprinkle enough henna in the water to make it the color of coffee. Part the hair in little strands and, with a small handbrush dipped into it, rub the scalp.

The hair, so beautiful at its best, so disappointing and even disfiguring at its worst, has many foes. The greatest of these is the extreme heat of midsummer. Under the midsummer sun’s rays the hair’s rich hue is liable to fade. The country roads powder their dust finely upon it. The heat parches the scalp or causes it to perspire excessively, and each of these evils, separately considered, seems worse than the other. Their results are the same, and the hair rapidly grows thinner.

If you are spending your vacation at the seashore beware of the action of the salt water upon your hair. If your hair has been splashed in the surf rinse it thoroughly with fresh water as soon as you leave the beach. Be sure that no particles of sea salt adhere to it, for salt, so healing and tonic for most of the body, is the contrary for the hair.

Keep your scalp in such condition that two words, “Cool” and “Clean,” will always describe it. If the scalp be cool and clean the hair will be beautiful. If the scalp be not cool and clean the hair will speedily reveal that fact. How to keep it so during the summer is a problem that every woman must be careful to solve according to her surroundings and facilities. But somehow she must attain that

end if she would preserve the beauty of her hair.

Keep it free from dust. To do so it must be frequently shampooed--twice as often, I should say, as in the winter. If, for instance, it is your habit to wash your hair every two weeks in winter, try washing it every week in summer. If it has required a weekly shampoo in winter you will undoubtedly find it necessary to wash it twice a week in midsummer. But you must judge that yourself, keeping before you the two words “Cool” and “Clean,” which should always be your guides. When the dust from the hair soils the fingers and brush it is time for a shampoo even though for a time the hair must be washed every day. The observant one will notice that so soon as the hair is unclean it falls out.

Also, she will observe that an itching scalp precedes almost immediately the falling out of the hair. With these object lessons in cleanliness she should resolve to be vigilant. Spare the shampoo and spoil the hair.

A good shampoo, especially for an itching scalp, contains beside the usual borax for softening the water, and the castile soap for cleansing the scalp these:

White of 2 eggs; juice of 2 lemons. Apply by rubbing the whites of the eggs thoroughly into the scalp with the tips of the fingers. After this application moisten the scalp thoroughly with the lemon juice diluted in one quart of cool water.

For the usual shampoo under ordinary circumstances the essentials are:

Warm water, 2 quarts; castile soap (shaven), ½ cake; borax, 1 teaspoonful.

I have heard women say: “I washed my hair yesterday and to-day it is as bad as ever.” If that is true it is your own fault. You did not give it a thorough shampoo. For a thorough shampoo care and nicety are necessary.

First prepare the water for a head bath by pouring into the stationary wash stand, or the portable washbowl or basin, the soap shavings. Over these pour a quart of hot water. With hands or a long handled spoon stir until the soap has dissolved and the substance has become mere lather. Part the hair, which I assume has previously been well combed, from the top of the middle of the forehead to the back of the neck. Make similar partings at the sides, and transverse partings here and there, as many as possible. With the finger tips, or with a soft, old nail brush, scrub the scalp with this lather. In this way go over the scalp several times, until it tingles under your very touch, and the skin is loosened from the scalp beneath. When a fine glow convinces you that this part of the task is well done attack your hair.

Dip your hands into the lather and taking the hair between them, wash it thoroughly but carefully with light touch as you would a fine handkerchief. When this has been thoroughly done empty the bowl and wash the hair through a second water. If, to use the hair dresser’s expression, the “water runs clear” you will know that the hair is thoroughly washed. If the water is dark, showing that the lather has not thoroughly removed the dust apply more lather. Then again wash it in cool water. The rinsing is best done with a spray. It should be continued until the water pouring off the hair is as clean as when it flows from the hydrant. The clearness of the rinsing water is the only criterion of whether the hair is clean. The rinsing water should be gradually cooled, but it should never be cold. It is my opinion that cold water is too severe a shock to the scalp.

Dry the hair as carefully as you have washed it. Never dry with a hot air funnel, nor at a radiator nor fireplace nor stove. The intense heat makes the hair brittle. A good brisk toweling is a method always available. If you haven’t time to dry the hair by toweling wait for the shampoo until you have time.

If you can sun dry it so much the better. Seated at an open window shake the moisture out of the hair and as it slowly dries massage the scalp with the fingers. The process of drying will be aided and neuralgia prevented by vigorous massage of the scalp.

This is an excellent time for the hair’s daily airing. The hair needs ventilation as well as your room, your lingerie, or your bed linen. Every day it should be shaken out and allowed to blow about in the wind. A balcony of a summer cottage is admirable for this purpose.

I know an English beauty who always gives her hair its airing as she sits under an old apple tree in the back yard of her father’s home. A friend of mine shakes her hair down and, sitting on the deck of her husband’s yacht, lets the wind play hide and seek in it every afternoon. Another friend returning by steamship from her vacation trip to Maine sat up aloft and tumbling her hair about her shoulders let the wind whip it at will.

Form the habit of always letting your hair down when you sit alone in your room. This half hour or hour's airing gives the hair exercise as well. When a hair hangs by its roots it is gaining the strength it loses while the hair is being supported upon the head by pins.

If the treatment of the hair has passed the stage of prevention and reached that of cure, dry, falling hair can be helped by this variant of the shampoo I have described:

Castile soap, ½ cake; borax (powdered), 4 teaspoonfuls; bay rum, 1 ounce; Italian pink, 20 drops; warm water, 1 quart.

A dry shampoo available for blondes, but which would leave unbecoming traces in dark hair, is:

Cornmeal, 2 ounces; orris root (powdered), 1 ounce. This shaken well into the hair and brushed out carries much of the dust with it, as does French chalk when brushed upon and off a soiled frock. This I commend in an emergency, but only then, for it does not clean the scalp as does the liquid shampoo.

Another shampoo that has been successfully used to check the falling of hair contains:

Borax, 2 tablespoonfuls; salts of tartar, 2 drams; almond oil, 2 ounces; Italian pink, 12 drops.

For dry hair this tonic is one of the best:

Sweet almond oil, 3 ounces; oil of rosemary, 1 ounce; oil of bergamot, 10 drops.

If dandruff afflict you in midsummer look first to your brushes. If you have neglected to keep them scrupulously clean begin to do so. Dip them whenever the least soiled into:

Hot water, 1 quart; violet ammonia, 1 ounce.

Place the brushes on the window sill to dry. Turn the brushes upon their sides so that they will dry quickly, and the bristles will remain firm.

Brush the hair thoroughly night and morning. Use a blunt edged, large toothed comb. Do not scrape the scalp. Make your diet during this time chiefly of fruit and vegetables. Apply also this lotion:

Borax, 3 tablespoonfuls; rosemary (best), 3 ounces; steep in one quart of boiling water. When cold add ½ ounce of glycerine and 30 drops of cologne.

If the hair be moist use one tablespoonful of borax in a shampoo two or three times a week.

While in your room give the hair plenty of rest and exercise. Both are provided by brushing the hair and letting it hang loose as long as possible in the sun and air baths. Usually the hair needs in summer at least one shampoo a week, unless the hair be extraordinarily dry. One of the best shampoos is made very simply:

Shaved castile soap, 1 ounce; hot water, 1 quart.

For a dry shampoo this is good for moist scalps:

Alcohol (95 per cent.), 1 quart; table salt, 1 ounce; quinine, 1-6 ounce.

If you pass your holiday at the seashore you will welcome a formula that will keep the hair in curl. Here is one of the best I know:

Gum arabic, ½ ounce; carbonate of potash, ½ ounce; glycerine, ½ ounce; rosewater, 1 pint; Portugal extract, 2 ounces.

Fortunate are you, indeed, if you come back from your summer outing with hair thick and lustrous, and scalp cool and loose skinned as when you left. But even if you have achieved this, your hair is certain to be faded, for the sun's rays while stimulating to the scalp, diminish the richness of the hue of the hair.

The probability is that the scalp has been dried by the heat and dust. Massage with cocoanut oil or the following tonic:

Sweet almond oil, 3 ounces; oil of cinnamon, 30 drops; oil of rosemary, 1 ounce.

Let me tell you of an experience which taught me much about the hair. I was invited to an informal house party. Arriving at an early hour in the morning I was met in the hall by my charming hostess. She was as lovely as ever, but there was something odd about her, something unusual.

She laughed at the puzzled look in my face. “You are bewildered,” she said. “I look different, but you do not know how. It is this. I am resting my hair.”

“Wonderful woman!” I cried. “It is the great American common sense.”

Then I saw that her lovely blond hair, short, as is all curling hair, rested about her shoulders in a golden shower. It was parted in the middle. She had always worn it in a pompadour or some modification of the pompadour. Now it was parted in the middle, and combed as smoothly as its rebellious luxuriance would permit away from that part, and flat upon the top of the head. Glistening from its recent brushing it hung about her shoulders, fresh combed, fresh brushed, and with the faintest odor of a cleansing tonic hanging about it. It had no ribbon about it. No hairpin confined it. It was free. It was resting after the nine months’ toil of a fashionable season.

“Every morning,” she said, “it has had a thorough combing and slight brushing. Every night a slight combing and thorough brushing. The first week I gave it a shampoo every day. I continued until the last trace of dandruff was gone. A sun-dried shampoo, of course. Every other sort, except the toweling, I consider barbarous and destructive to the hair. Every afternoon when the sun shone in my bedroom window I have let down my hair and sat where the breeze and sunshine came through the open window. Sitting there I have taken my hair between my palms and, strand by strand, have rubbed it lightly until every hair has had its burnishing. When this was done I shook it out loosely between my thumb and forefingers so that the wind and sun could reach every part of the hair and scalp.”

My friend’s hair had made almost instant response to the treatment. From being dead hair it had become live as a galvanic battery. From being dull and faded it had become rich and glistening. All over her scalp was the fine first fuzz of a new crop of hair. And the old galvanized hair had grown an inch longer in one month.

She had experimented with various lotions or dry shampoos. This she found the greatest cleanser and tonic for her hair:

Peruvian bark (powdered), 3 ounces; rum, 1 pint.

Another aid to this summer rest of the hair was a new brush. She showed it to me. It was a plain wooden backed hair brush, with the bristles set well into the back in groups. The bristles in these groups were irregular, in order that they might reach all parts of the head, the long ones penetrating the hair where it was thickest, the short ones sufficing for the parts where it was thinnest.

She adjured vaseline, as I have advised my readers to do. It is a mineral oil and cannot cause the hair to grow. Instead, she rubs olive oil or beef marrow well into the roots of the hair at night, softening the scalp and fertilizing a dry area.

Also she varied these treatments with this which, being a woman of wide reading, she had copied from The Lancet:

Alcohol (95 per cent.), 4 ounces; quinine, 15 grains; castor oil, ■ ounce.

Careful to massage the head gently every night after its brushing, she kept the scalp loose. When it was hot she cooled it by applications of cracked ice in an ice cap. She shunned the tempting fine tooth comb, that removes dandruff, it is true, but perpetrates atrocities upon the scalp as painful and disfiguring as scratches upon the face. Once a month she had her hair singed, before a shampoo.

Her greatest concession to the conventions was the slipping over her shining, well curried mane a net of exactly the same shade, which she wore at dinner, “a token of respect for the soup and butter, merely,” she explained.

One hundred strokes every evening before retiring are necessary if the hair be of vigorous constitution. If delicate there is danger of its being torn from the roots by too strong strokes of the brush and too many of these and the number of strokes can be considerably lessened.

Brushing removes the dust, but is not sufficient stimulant for the scalp, which needs, beside brushing, massage. The most beautiful hair I know is that of a young woman who gives her scalp a thorough massage three times a week with a good hair tonic. This, her favorite tonic, I publish here for the use of such of my readers as are blondes. It contains one ingredient, bicarbonate of soda,

whose tendency is to make the hair a lighter shade. Therefore, I do not use it myself nor would I recommend it for any other brunette:

Borax, 1 ounce; bicarbonate of soda, ½ ounce; camphor, 1 dram; glycerine, ½ ounce; rosewater, 1 quart; alcohol, 2 ounces. The camphor should be dissolved in the alcohol. The soda, glycerine, rosewater and alcohol should be mixed and well shaken in another bottle. Then pour this mixture into the solution of camphor. Apply with the finger tips, or a soft brush, parting the hair and rubbing the tonic thoroughly into the scalp, until it makes response by a healthful tingling.

A former method of scalp massage was to rub it haphazard with the tips of the fingers. From Europe has come a later and more scientific method. It consists in treating the scalp as though it were composed of circular terraces, treating each terrace at a time separately by pressing the cushions of the fingers firmly upon the scalp all the way round the terrace, beginning with that which is the first or the outer and working toward the center. This pressure achieves that for which massage of the scalp was invented. It loosens the skin from the scalp, permitting free circulation about the roots of the hair.

For a brunette my preference is for this:

Sulphate of quinine, 20 grains; fluid extract of jaborandi, 1 ounce; glycerine, 2 ounces; cologne, 4 ounces; bay rum, 4 ounces; rosewater, 20 ounces.

The above is excellent also for hair that is too dry. For moist hair I advise a dry shampoo or tonic treatment of this:

Eau de cologne, 4 ounces; borax, ½ ounce; tincture of cochineal, ½ ounce.

Some blondes whom I know use the following methods to keep their hair light:

Washing soda, 2 tablespoonfuls; water, 1 quart. Dissolve the soda in the water and give the hair a thorough shampoo with the mixture once a week if needed, less often if necessary. The susceptibility of the hair to treatment determines the number of the treatments.

A half dozen drops of ammonia in shampoo should keep the hair light. Also one teaspoonful of peroxide of hydrogen in one quart of water will lighten without injuring the hair.

Bear in mind that whatever makes the hair dry makes it brittle, and use any preparation discreetly, studying the effect of one or two applications on the hair.

Remember that headache is one of the greatest foes of the hair. When my scalp is feverish I sometimes apply a rubber cap filled with cracked ice for a half an hour or longer, until the congestion is removed.

Never retire without brushing your hair. The hair is a dust trap, and no dainty woman would retire without removing the day’s accumulation of dust. The brush tells its own story of the day’s catch of dust, if you take the trouble to examine it. After brushing the hair, loosen the skin from the scalp by slow, firm massage, pressing the skin toward the crown.

This is the best time to apply a hair tonic. A good hair tonic is made of:

Oil of mace, 2 grams; essence of rosemary, 60 grams; oil of sweet almonds, 30 grams.

I have found that, while I may protect my skin, my eyes, my hands somewhat from the winds of winter, my hair always suffers from it. The wind I found dried the oil in it, making it harsh and brittle. Ordinary massage and brushing I did not find as useful as in the summer. I tried many remedies for the dry condition of the scalp, which, of course, produced dry hair. At last I hit upon this, which I rubbed well into the roots of the hair before retiring on the night before my shampooing day:

Lanolin, 1 ounce; sulphur, ¼ ounce.

Let me explain, I did not rub this haphazard upon the scalp. I have seen women dab a hair scalp emollient so carelessly upon the scalp, here and there, that they might quite as well have left it undone and employed their time for better purposes. I did this as thoroughly as, I think, everything we undertake should be done.

First, I combed the hair thoroughly, doing it slowly, beginning about an inch from the ends, holding the long hair near the roots so that rough combing might not pull it out. Then I brushed it slowly, beginning at the roots and brushing downward with long, slow strokes to the very end. I parted the hair into fifty strands, combing it smoothly away from each little parting.

Then, with fingers dipped into the mixture of lanolin and sulphur, I began at the hair line and, with firm, long strokes, the effect of which was to loosen the skin from the scalp, I rubbed the mixture well into the roots. From the hair line I followed the partings to the crown, from which it radiated. This done, and thoroughly done, I unbraided my hair and combed and brushed it once more, and allowed it to hang loose for an hour or more, exercising and ventilating it, until I retired, when it was braided and tied into two large, loose braids and tied at the end with narrow ribbons. I never use either elastic or thread to fasten the ends of the hair, for I think it breaks the hairs, making the ends uneven.

The next morning I have a shampoo. Ordinarily I use a lather of white castile soap and warm water. But in winter, noting the drying effects of the cold winds upon my hair, I try to use a shampoo which will aid in making the hair soft and lustrous, doing for the time the work of the natural oils, which seem to have suspended operations:

Yolks of 2 eggs; warm water, 1 quart.

I part the hair into fifty strands, as I have described, the night before, and into each of the partings and particularly around the hair line, which a woman cannot afford to neglect, I rub the tips of the fingers with the yolks of the eggs, using the tips of the first two fingers. When this has been thoroughly done I rinse the hair and scalp in warm water. After the hair has “been through the first water,” I turn upon the scalp a spray from a small hose, one of the small-size sprays now made for shampooing. This distributes the water better, and the force is not so great as when it is poured from a pitcher in the old-fashioned “home” way.

The full force of city water must never be used upon the tender scalp. The little sprays are cheap and a good investment. The shower from the spray can be gradually cooled, but I do not believe in extremes of temperature for the hair any more than I do for the complexion. I never use either cold or hot water for a shampoo, nor cold water for rinsing. Warm to cool water is a sufficient gradation that soothes the nerves of the scalp, while dashes of hot and cold water overstimulate and shock them.

CHAPTER IX

USEFUL BEAUTY HINTS FOR MEN

Men take beauty treatments. Had that been a secret heretofore, one of their own sex revealed it. David Graham Phillips, whom some critics have called the Zola, others the Flaubert, of American literature, tells of the disappearance of a wealthy broker who was taking a beauty treatment.

Of what do men’s beauty treatments consist? Like the soundest of beauty treatments given to women, some of them are the rebuilding of the constitution upon a basis of health. Muldoon, of White Plains, many a New York man considers the greatest of beauty doctors. Men of London and some men of Paris have the same unlimited faith in Sandow.

No intelligent person can doubt that rest, regular living and much out-of-door air will make a person’s beauty greater, because it will strengthen the very pedestal of beauty, which is health. Every man is justified in taking one of these beauty vacations, which is, after all, a health vacation, a tonic time for the entire system.

If I were asked what the smart man has most regard for in his appearance, I should say his baths, which the English and those who spend much time in England, call their “tubs,” and the cut of their clothes.

As to the baths, the man who is really not unkempt, by the standards of the high world, has two baths a day, in the morning a cold plunge or shower as a tonic, in the evening just before dinner a tepid or warm bath, with a shower afterward, as a cleanser.

The cold bath is not cleansing. On the contrary it merely closes the pores, shutting the gates upon the effete matter that is trying to escape from the system by means of the millions of little gateways in the skin. It is valuable as a tonic to the nervous system, by means of the shock it gives to that system. But not even my lord man, mighty in his strength, should take such powerful tonics without having consulted his physician about it.

A man who always seems to shine with the radiance of his bath pours a wineglassful of perfumed ammonia into a tub of water. This softens the water, removes the odors of perspiration and whitens the skin.

An exquisite who is the fashion in London uses a quarter of a pound of borax in his bath to soften the water and so refine his skin.

I once heard the story of the physician with so admirable a skin that all his women patients asked the secret of his complexion's perfection. He told one, who generously told many others, that knowing the mighty power of absorption of the skin, he had experimented with the use of Epsom salts in the bath. He had found it stimulating and, in consequence, had used a pound of the salts dissolved in a bathtubful of water, every day.

A salt bath is stimulating. Rubbing handfuls of table salt on the body, getting it into a fine glow before the bath, is one means of absorbing the salt into the system. Another is pouring an ordinary five-cent bag of table salt into the water and letting it thoroughly dissolve before taking the bath.

[Illustration: MAXINE ELLIOTT Whom Mme. Cavalieri admires not only for her classic lines of face and figure, but also for her admirable taste in dress.]

But ask any well-groomed man if baths are sufficient for cleanliness and he will answer, "No. No man can be clean unless he walks four to six miles a day." There must be then three baths, the cold plunge in the morning, the natural perspiratory bath at any time that is convenient between the two, and the before-dinner tub in the evening, for the cleanliness that obtains among men who are proud of their grooming.

The man who fears baldness does well to avoid a tight hat. The size should be large enough to permit ventilation of the hair and scalp. Also he should puncture the hat with fine holes for the same purpose.

A man is his own best judge of when he needs a shampoo. If the hair falls unduly, or if it feels sticky, or if the brush is considerably soiled after brushing, it is time for a shampoo, even though you had one three days before. If there is much dandruff in the hair there is need of a shampoo. A shampoo successfully used by a relative of mine who has beautifully thick and glossy hair is made of:

Tincture of green soap, 1 tablespoonful; the whites of two eggs; cologne, 10 drops.

If the hair is dark the yolks of the eggs may also be used. The eggs are beaten into the water, the soap added and the cologne sprinkled in. To prevent catching cold after a shampoo, rub alcohol into the hair about the neck and cheeks and temples.

Remember that there would be no baldness if the hair roots were properly nourished. So keep a plentiful supply of blood flowing in that direction by massage. If the scalp is dry rub olive oil or lanolin liberally into the scalp at night.

Be sure to keep the skin of the scalp so loose that it can be easily moved about, and keep it cool if to do so you must occasionally place on the head when it is overheated a bag of cracked ice or a cloth dipped into cold water, renewing it as the cloth dries.

One authority on the hair believes in a daily pulling, not by an irate wife, but by yourself. He believes that this takes the place of exercise for the hair and that it strengthens the roots as walking strengthens the muscles of the legs or rowing the muscles of the arms.

Every man fears the ugly dewlap, often called "the statesman chin." He can prevent this by carrying his head and chin well up. He can to some extent correct it by using webbing chin bandages at night.

CHAPTER X

THE CARE OF THE NAILS AND FINGERS

Dainty finger nails are Nature's finishing touch for a beautiful woman. They have always seemed to me to be the natural jewels of the hands, and if they are in good order, that other jewels are unnecessary, if not superfluous.

Let me describe these jewels at their best. They are of color pink, as the deep, fresh heart of a blush rose. In shape they are nearly like the filbert nut. In size they are in good proportion to the size of the finger and the hand. They must be neither too large nor too small. They must seem to be long. They are more like the petals of a half-blown rose, or the lining of a sea-shell, than anything else in nature. At their base must be a crescent tiny in proportion to the size of the nail, but as clear cut and silvery as a young moon on the night of its début in the sky.

Is there need to say that the other end of the nail be spotless, as utterly beyond suspicion as the character of Cæsar's wife? There must not be the slightest rim nor shadow to darken the fair pinkness of the nails.

The skin about them must seem to bear but remote and casual relation to the nails. It must be discouraged from any intimacy with the nail, any closer intimacy, shall we say, than the thorny calyx with the rose? It serves, indeed, the same purpose. It is the mere protector of its charming charge.

Thus should the nails be. But how to make and keep them so is what we must discuss to-day. In the first place, as to their daily care. If they are in normally good condition, the morning hand bath should be supplemented by soaking the nails themselves for five minutes in warm soap-suds or lather made of castile soap.

This supplemental nail bath should be followed by a careful pressing back with the towel of the skin about the nails until each portion of the skin is detached.

A third step in the daily care of the nails is to brush them vigorously with a nail brush dipped into the soap-suds.

Notice next whether any portion of the skin about the nails is still attached, or if not attached, is slightly sore. If it is, that portion of the nail should be anointed with a bit of camphor ice or with vaseline or lanolin, or a preparation containing witch hazel. If necessary, wrap it round with white muslin or white silk.

If in spite of all these endeavors there remains a faintly dark rim around the end of the nail, one further process is necessary. Wrap around the pointed end of an orange-wood stick a bit of antiseptic cotton. Moisten this with a few drops of peroxide of hydrogen. With this carefully remove the dust that may remain between the nail and the skin. Never use a steel instrument, an ivory nail cleaner, or anything harder than the cotton wrapped around the end of the orange stick. If you do, the sensitive skin under the nail is lacerated. Dust settles upon the ragged ends of the skin, and the ugly, disfiguring dark rim is evident.

If the nails become brittle it is because they are dry and they should at once be moistened by an oil bath. Into a small, shallow bowl pour a gill or more of olive oil. Soak the nail in this for ten minutes or longer every evening until the condition is corrected. If for any reason this is not feasible, massage them every evening with cold cream. If white spots appear under the nails rub the nail with slices of lemon.

Sometimes the nails grow soft and dull. In such case I have found of value this mixture, which, after having been melted on a slow fire, cooled and poured into a pomade jar, should be rubbed on the nails to restore them to their former hardness and brilliancy:

White wax, 250 centigrams; nut oil, 15 grams; resin, 5 grams; alum, 1 gram.

If a kind friend gives you a manicure set, smile outwardly, but inwardly regret that you have not the difference between the original small cost of the tools and the exorbitant price paid for the elegant case containing what is usually an inferior set of instruments.

The outfit should consist of:

One large nail brush, for the outer part of the nail; one small nail brush to go under the nail; one strong but pliable nail file; one polisher (chamois or covered); two pairs of curved scissors (one pair for each hand. There are scissors made especially for cutting the nails of the right hand, and vice versa); one orange stick; one box of powdered pumice; one box of nail powder.

First go round the outer edge of the nail with an orange stick, pressing the cuticle back firmly but softly, but do not press the nail, which is exceedingly sensitive. Any pressure upon it may injure the sensitive cutis beneath. Coax the white half-moon at the base of the nail into full view. This moon, like the other young moon, is reluctant to appear.

Then file the nail into any shape you wish. A slightly pointed effect is admissible, and is becoming to nearly all hands. It especially counteracts the plumpness of the hand that nature has made too short. Dipping the nail polisher or brush into the powder, rub the nail until my figure of their being “natural jewels of the hands” becomes apparent. Stop short of a too high polish. With the extra brush remove all the powder that has adhered.

Most manicures assist the process by soaking the hands alternately for five minutes after they have been filed. The palms of the hands add a polish to nails that are not readily susceptible to the polisher. You will find that the oftener you polish your nails the more susceptible do they become of polish.

This nail powder lends itself well to polishing:

Pulverized starch, ¼ ounce; boric acid powdered, ¼ ounce; talcum powder, ¼ ounce; tincture of carmine, 10 drops.

Another which I have used satisfactorily is composed of:

Oxide of tin, thoroughly powdered, 10 drams; oil of lavender, 60 drops; tincture of carmine, 20 drops. One-half of this quantity may be put up and will serve for many weeks.

Still another good nail polish is made like this:

Zinc oxide, 1 ounce; carmine, 4 grams; oil of violet to suit taste.

This nail rouge is excellent:

Fresh lard, 1 dram; finely powdered carmine, ½ dram; oil of bergamot, 12 drops.

This, which was derived, I am told, from the Orient, is effective:

Chippings of alkanet, ¼ ounce; alcohol, 95 per cent., 1 ounce. After this mixture macerates for one week it becomes a brilliant color. Apply to the finger tips with jeweler's cotton, blending it afterwards with more cotton.

Personally I prefer to do my own nails. They should be done every day to attain perfection. Two or three times a week are needful, and at least once a week essential.

The purpose is to keep the nails clean, to make them shapely, to preserve their color, to adorn the tips of the fingers.

I have tried to make my nails the exact shape of a filbert. I keep them very pointed, and do not sandpaper, that is, shorten them oftener than twice a month. But the daily process is this:

First, to study them in a good light and to see whether there be any stains on the fingers. If there are I rub the stains with pumice stone until they have disappeared.

Second, I look carefully to the half moons at the base of the nails. They are as illuminating to the nails as the new moon to the heavens. If they are well defined I merely press the cuticle back gently when I dry my hands. But if they be overgrown with cuticle I give them a bath in olive oil. Into a shallow vessel I pour a half pint of olive oil. Into this I dip my nails, holding them there for five minutes if they are but slightly overgrown, fifteen minutes if extremely covered with the cuticle. Then when the cuticle is softened I carefully go over each one with a linen towel, softly pressing back the skin. If it clings obstinately I do not persist, but resolve that the fingers must have several oil baths. Also I resolve that that night I will rub them as carefully with cold cream as I do any other part of the hands. In a week the half moons should stand beautifully revealed. If not I continue the oil baths in the morning and cold cream applications at night until they are visible.

Third, I twist about the point of an orange wood stick a bit of cotton, dip the end into peroxide of hydrogen and rub the dampened point of the orange wood stick along the inside of the nail. Mark that I said nail, not skin. The reason so many persons must keep their nails short to keep them clean is that they use sharp or jagged instruments to clean the nail, and pressing this upon the skin beneath the nail makes it ragged. The uneven edges of the skin catch the dust and give the gray or even black rim that is so ugly a border for the fingers.

Fourth, with a chamois I polish each finger nail by three or four strokes, using the least touch of nail rouge before the polishing. Pink nails are charming. Red nails are horrible.

Don't, I beg, allow your hands to grow old. Hands, unless well cared for, betray the age more quickly than does the face.

Study your hands well. Don't let the skin grow coarse. Don't let the veins grow large. Don't let the skin hang in folds and creases about them. Never allow the divorce of the skin from the muscles.

The young hand is smooth and firm. The old is rough skinned and loose muscled. In the youthful hand the veins are only faintly indicated. In the old hands they stand forth as whipcords. When the hand is young, the knuckles are inconspicuous. When it is old, they are more prominent than any other part of the hand. There is between the young hand and the old the same difference there is between the thin bark of a sappling and the thick, rugged bark of a storm-beaten old oak. The nails in youth are thin and pink. In old age they are thick and yellow.

Knowing these signs, the intelligent student of beauty culture will avoid them. She will discourage these symptoms of multiplying years. The cause of aged hands is the common cause of bodily decay, defective circulation. If you note signs of ageing in your

hands, attend more than ever before to the circulation. Exercise promotes circulation. Exercise your hands, particularly the fingers.

Fancy that your fingers are but loosely attached to the hands and that you are trying to shake them off. Raise them from the elbows, and, with the hands bent at the wrist, vigorously shake them, with fingers spread and loose. (1) Shake them from right to left and back again. (2) Shake them up and down. (3) Shake them round and round.

Invent exercises of your own. Any movement that will cause the blood to flow at an increased rapidity will renourish and so rejuvenate the hands. We read in poem and story that the sorrow stricken heroine wrings her hands. This may or may not be a vent for her grief, but it is an excellent means of making her hands healthier and so more beautiful.

Daily exercises, say ten to fifteen times every morning, will do much to beautify the hands and so render them prettier. The ageing hand is the hand whose muscles are shrinking. Increase the circulation and the hand will plumpen and in time resume its youthful lines.

My favorite methods of massage for the hands are two, the motion we use when washing the hands, and that we use when smoothing down and fitting fingers of a pair of gloves. Stroke the hands down the back from the spaces between the fingers, and lock the hands together, interlacing the fingers and tightly squeezing them.

The skin of the hands needs food as well as does the skin of the face. Both are exposed to drying tendencies of the outer air and the heating influence of the inner, and both need a replenishing of the natural oils thus lost. Olive oil is a good food for the skin of the hands. The large pores quickly absorb this medium and a few weeks' treatment soon works a marvelous change.

Aged anæmic hands should have an oil bath, or should be fed with cold cream every night. Wash them exactly as though they were soiled and you were trying to remove the dirt with soap and water. Either the following cream or the paste that follows serve well that purpose:

Almond oil, 1½ ounces; cucumber juice, 1 ounce; white wax, 1 dram; spermaceti, 1 ounce; oil of neroli, 5 drops.

Crushed sweet almonds, 1 ounce; crushed bitter almonds, 1 ounce; spermaceti, 2 drams; oil of almonds, ¼ ounce; white castile soap scraped fine, ½ ounce; oil of orange, 6 drops.

To relieve the congested, swollen appearance of the hands, form the habit of holding them upward so that the blood will run out of them instead of downward so that the blood will run into them.

Also to avoid this congested condition of the hands, that distends the veins unbecomingly, avoid lifting heavy weights. For lifting anything of heavy weight stretches the hands, making them larger and overfilling the blood vessels.

Even piano playing enlarges the hands that reach the octaves, and to some extent causes swollen veins. The beauties of the old French courts so well understood this that they never used their hands when it was avoidable.

Enlarged knuckles, one of the signs of age, can be prevented by avoiding overwork and carrying heavy weights. If the knuckles be naturally large, it is well to keep the hands well plumped by good circulation and much feeding of the tissues with oils and creams.

This same precaution will prevent the hands becoming unshapely. But if they were unshapely from birth, they can be improved by pinching the tips of the fingers from the sides, or by wearing clamps, or if these be not available, by wearing thimbles on all the fingers a half hour or more each day.

They can be made longer and slimmer by massaging the hands with long, slow strokes from the wrists to the tips of the fingers, always with the hands well oiled or covered with pure cold cream.

Massage of the fingers can be profitably combined with massage of the face by using a rotary motion of the finger tips. This stimulates both face and finger muscles.

Hands of any age should be kept white. Reddened hands are always unsightly, whatever the cause. There are four causes for reddened hands. One is washing in hot or cold water. Another is exposure to cold air. A third is extremely hard manual labor. A fourth is the habit of holding the hands downward.

There are a good many bleaches for the hands. One of the best is washing the hands in a bowl of warm milk every night. Another is that old friend of the dainty, which should be within reach of every toilet table--a lemon. There is no bleach better than half a lemon

rubbed on the back of palms of the hands before retiring.

This, too, is an excellent bleach which also softens the hands. The addition of perfume makes it a pleasant preparation:

Lemon juice, 1 ounce; honey, 1 ounce; eau de cologne, 1 ounce.

When my hands are soiled I wash them in warm--never hot--water with a pure soap. Lifting my hands from the bowl of warm water I pour upon them a tablespoonful from a bottle of:

Rosewater, 3 ounces; glycerine, 1 ounce; carbolic acid, 10 drops.

I wash my hands thoroughly again in this and dry them upon a soft towel, a piece of cheesecloth or an old silk handkerchief, and am careful to wipe them thoroughly dry. Chapped hands are the penalty of careless drying. To further whiten the hands carbolic acid may be added to this mixture: 10 drops to 4 ounces of the rosewater and glycerine.

The woman who does her own housework often finds the skin about the joints of her fingers getting loose and flabby and the skin at the sides of the nails becoming calloused. For these troubles I advise wearing large, loose gloves while sweeping and dusting. Don't put your hands in hot water more than is necessary. Massage the hands as I have directed and soak them every day in a bowl of milk or olive oil. Use one of the bleaches I have recommended, and wear big, loose rubber gloves, three or four sizes larger than your kid gloves, at night.

At luncheon one day in London I saw a girl trying to hide her hands. Some one had remarked that hands may look old when their owner is not. The discussion of the subject threw the girl into acute embarrassment, and her hands sought to screen themselves beneath the damask of her dinner napkin. Interested, I studied those hands when I could do so without embarrassment to the girl. They were large and red, but what made the unhappy guest try to hide them was that they were what every beauty specialist knows as "old hands."

Had I judged the age of their possessor by those hands I should have said she was fifty. They were deeply wrinkled. The skin had formed in deep creases about the knuckles. The texture was coarse. There was the resigned look of accepted age in their contour. Yet when my eyes traveled up from those hands to the figure of the girl I saw that it was slender and undeveloped, and as my scrutiny extended to the face I saw that it was fresh and sweet as an English primrose that grows in one of the deliciously romantic English lanes. She was young as the unblown rosebud, as the fledgling just peeping over the nest, as the silver crescent moon is young. But she had old hands. Why?

A keenly observant man said to me: "I was traveling to Cherbourg. I was in the same compartment as two women. My eyes tired of the landscape, and came back to my fellow travelers. One of the women had drawn off her gloves. Her hands lay in her lap. Idly I speculated about their owner. I guessed by those hands that she was forty. Her face showed she was not more than eighteen. Next I glanced at her companion's hands. They, too, were ungloved and, lying relaxed in her lap, were aged hands. She must be eighty, I thought, and a glimpse of her face confounded me. It was that of a woman in middle life. She was of that opulent beauty whose midsummer is prolonged indefinitely. She was probably forty-five. And the girl beside her was her daughter. She was an exact replica of her, even to her hands. The girl had inherited those aged hands."

My friend the traveler is clever, but I do not agree with his conclusions. At least not fully. Hands age prematurely because they are neglected. We inherit certain tendencies rather than any unchangeable physical appearances. And the girl had inherited her mother's tendencies to neglect her hands. Doubtless they kept them clean. Perhaps they used the nail brush quite often and as vigorously as necessary. Probably they used the orange stick around the edges of the nails to loosen the skin. Nevertheless, I insist that these prematurely aged hands were neglected.

Why? Because they were hungry.

You are surprised? But consider. Have you looked at your own face in the mirror when you were hungry? Hunger had cut deep lines about your lips and beneath your eyes and in your cheeks. Had it not? And you had merely missed a meal because a train was delayed or because you had a headache.

This is what happens to the hands that are not well fed. A great American specialist on nerves said that the hand is a delicate instrument of the body and needs especial care. He insists that much thought should be given to their care. An important part of caring for them is to feed them so well that the tissues worn out by continuous using of the hands is quickly replaced.

Cocoa butter is a nourishing article of diet for the hands. When you have removed the dust and powder from the hands by bathing them in warm, not hot, water--hot water shrivels the skin and causes wrinkles--and a mild soap, dry them on a soft towel and rub cocoa butter gently and liberally into them.

Olive oil containing a few drops of benzoin, to act as a whitener, is an excellent hand food. Wash the hands in it after the water and soap bath. It neutralizes the drying effect of the soap.

Glycerine “agrees” with some hands. If it does not redden and make them sensitive, as you can learn by two or three applications, it will be a good article of hand food. Equal parts of glycerine and rosewater will make a milder application, for glycerine alone is often an irritant. If lemon juice is used instead of the rosewater, it whitens the hands.

Well fed hands I have seen have their daily meal of cocoanut oil. Several cold creams are good hand foods. So is buttermilk.

Many of my friends complain that winter always leaves them with “disgraceful looking hands.” I do not suppose that this statement is really true. Americans, and especially American girls, are prone to extravagance in conversation. What they mean by this bill of complaint, is that the cold weather makes their hands look rough and red.

Don’t mourn those reddened, coarse-looking hands. You will only etch lines in your face and cause the muscles to sag as muscles do early in life if they have not been upheld by a cheerful disposition and the facial exercise that laughter brings. Besides all force is wasted that is not used in upbuilding new conditions or in remedying old ones.

What is to be done with those red hands? First, do not expose them to sudden changes of temperature. Don’t plunge them into hot water and draw them out of the hot water and dry them in a cold room. Sleep in a cold room by all means, but don’t dress in one. If there are no means to make your bedroom warm for the morning toilet dress in some part of the house that is warmed, if necessary by the kitchen stove. Cold followed by heat or the opposite extreme is sure to redden the hands and to coarsen the texture of their skin.

Second, do not wear tight gloves. I dislike a tightly-gloved hand. It has always seemed to me vulgar. I am glad to see that Fashion is recognizing this and giving her endorsement to the practice of wearing gloves a half or whole size too large, so that the glove will wrinkle a trifle over the hand and look as though the wearer were comfortable. Wear gloves that are otherwise comfortable, that is, that do not irritate the skin. For summer cotton or very thin suede, silk or chamois are best. Suede are best in winter, because they are softer than most other materials used by the glover in providing his stock. Woolen gloves may be worn over the gloves, but I do not advise wearing them next to the skin, for they chafe the skin, making it rough.

Third, do not wash them in water too often while they are in the coarse, reddened state. Remove the dust or grime when possible by rubbing oil or cold cream over the hands and afterwards carefully wiping them. When you wash them in water let it be in merely warm water. Into this you may drop a teaspoonful of powdered borax to a quart of water, or in the same amount of water a dessert-spoonful of liquid ammonia or a half dozen drops of tincture of benzoin. All these will whiten the skin. If you drop in the water a handful of bran or oatmeal it will soften and whiten the hands. Dry the hands gently. Don’t treat them as though you were putting them through a clothes wringer with the Monday wash.

Fourth, until the hands reach the refined condition you desire, never retire without dressing them for the night. Rub over them thickly lanolin, or nafalan, or a mixture of equal parts of vaseline and lanolin. If you have made the hands too greasy by this application wipe off the superfluous cream with a soft handkerchief or piece of cheesecloth. Or if you prefer you can use the English paste, or the French, formulas for which follow:

Pure soap shaved, ½ quart; olive oil, ½ quart; mutton suet, ¼ quart; brandy, ¼ quart. Warm the soap, suet and oil until they blend. While they are still tepid pour in the brandy. Add a few drops of any favorite perfume if desired.

Eau de cologne, 100 grams; oil of almonds, 100 grams; powdered soap, 30 grams. Warm to blending point; then shake well and pour into a jar, and keep in a cool place.

Spread one of these pastes over the hands and draw over the hands large loose rubber or large old kid gloves, before retiring.

If the hands have reached such stage of roughness that there are small cracks or fissures in the skin cover these cracks or fissures with zinc oxide plasters. If the fissures are very deep apply a salicylic soap plaster.

If your hands “take a notion to be red,” say at an evening party or at a tea, for instance, when you are expected to “pour,” shake them violently, so that if the fingers were less loosely attached they would fly off.

Also work the hands back and forth from the wrists for a few minutes. This is better than the old French custom of holding the hands up to let the blood run out, for the blood will run back into them again as soon as the hands are held as usual. On the other hand the shaking of the hands and limbering of the wrists will restore the circulation, the interruption of which has caused the hands to redden. Be sure that your rings are not too tight, for if they are they will impede the circulation and cause the redness so many of you are trying to avoid.

[Illustration: LOIS EWELL A wealth of Titian hair adds the crowning charm to the winsome beauty of this Century Opera House prima donna.]

CHAPTER XI

BEAUTY BATHS

Let me direct the baths of the body and the complexion will take care of itself.

How shall I impress upon you, my beautiful reader, who would remain beautiful, my plain reader--if ever a woman was plain--who wants to be beautiful, how necessary is the frequent bath? By this I mean the daily bath. Let me tell you that which you may have forgotten, that when we speak of the skin as “the third lung” we minimize its importance. The skin discharges twice as much waste matter from the body as do the lungs. Keep that ever in mind and help the skin in its task.

Again there is the story, which you also may have heard and forgotten, that the man whose skin has been gilded in an effort to make of him a man of gold, died in a few hours because his pores, having been filled, could not discharge their function.

The daily bath, in some instances, the bath twice a day, is not as persons advanced in some directions and pitiably behind in others tell us, a luxury. It is a necessity. It does not, as some ignorantly assume, destroy the oils of the skin. It causes them to circulate more freely through the medium of the skin.

Permit me to picture to you the condition which a bath changes. Have you ever seen a shower of ashes? How, from a disturbed furnace, a gray flurry rises, then falls thickly as snow upon the nearest smooth surface? That is what happens to the skin. The shower of white ashes, refuse from the fires in the human body, pushes its way through the pores to the surface of the body, or the skin. There, in the mouths of the pores, they remain, obstructing them as a wagonload of soil would obstruct the mouth of a sewer if poured into it and allowed to remain.

The shower of human ashes must be removed, just as the traces of a snowfall are removed from city streets, quickly and thoroughly, else traffic is impeded. The scarf skin must go, and the best and most direct way to send it is by the route of the bath.

I have described in a previous chapter my own method of bathing. I find the tepid bath in the morning, followed by a slightly cooler shower, or splash with sponge or hands, the best for my needs. Also for drying the skin I prefer a soft towel, for it is best for my skin. But I do not recommend this as a universal method.

My skin happens to be exceedingly thin and sensitive, annoyingly so. If it were one of the hardier, more durable sort, with a tendency to a coarsening and roughening, I should try this much more drastic method of removing scarf skin. If I were strong enough and my physicians vouched for the fact that I were, I would try the daily cold plunge or shower. This I would take in the morning remaining in the icy tub or under the chilling shower not more than one minute. Then I should have a brisk rubdown, not with the soft linen towel or cheesecloth, but with a big, coarse Turkish towel. For this purpose I like best the big towels that swathe the body completely, which one may wrap round herself, and, wrapped in them, sit upon a bathing stool and dry herself with immunity from chill. Unless I were to dress at once, I should briskly rub the body with alcohol to render less the possibility of taking cold. But if my room were sunny I would prefer to run about the room half a dozen times, or a rehearsal of dancing steps for five minutes, or jumping the rope. One of the greatest authorities on hygiene in your country has advocated exercise--he called it a sun bath--directly after the bath.

But this would by no means suffice for my bathing. For every one except an Englishman knows that the cold bath does not cleanse. It merely exhilarates. For keeping the skin clean there should be the warm bath. You observe that I did not say the hot bath, for it is my opinion that the hot bath enervates. For cleansing the water should be from 90 to 95 degrees Fahrenheit.

A good soap should be plentifully used. White castile, the soaps made from spermaceti and good glycerine soaps I believe to be the best. The soap need not be used directly upon the skin. Much better is it that for ten minutes or a quarter of an hour before you take your night bath a cake of soap or a quantity of it shaved be thrown into the water, so that the water becomes a milky color, or that a lather rise to the top of the water.

Thus soap will never, except in its diluted form, touch the skin. The per cent. of lye which is used in the manufacture of soaps that would actually touch the skin would be very small. A soft brush would be useful for a coarse skin. I never advocate a hard one, for it is liable to abrade the skin.

No one should remain in the bath more than twenty minutes, and this time should include the rinsing off of the soapy water by a shower or spray of cooler, perhaps fifteen degrees cooler, not cold, water. A cold shower at night, when this cleansing bath is taken, would be over-stimulative, and tend, as does the strong coffee to certain persons, to keep them awake.

Between the two extremes of gentle and drastic bathing lie many intermediaries known as beauty baths. There is, for example, that simple and efficacious starch bath, taken by women whose skins are tormented and disfigured by pimples.

To an ordinary bathtub half filled with water add one pound of pure starch. Let it dissolve in water at 90 to 95 degrees Fahrenheit. To this many French women choose to add one wineglass of toilet ammonia for its whitening effect.

The oatmeal bag is an old and admirable remedy for rough or stained skin. The best is made in this way:

Oatmeal, 1 pound; pulverized orris root, ½ pound. Stir well together and sew into a large square bag. Toss the bag into the tub and let it remain in the warm water for fifteen minutes. It will give the water that delightful milky aspect so pleasant to the luxurious bather. Bran may be manipulated in the same way with equally good results.

For whitening and softening the skin a bath powder may be made at home from these ingredients:

Bicarbonate of soda, 6 ounces; cream of tartar, 5 ounces; starch, 8 ounces; oil of lemon, 1 dram; oil of bergamot, 10 drops. If another scent is preferred to bergamot it can be substituted; for instance, 5 drops of oil of rose geranium.

For a person not strong enough to endure the cold bath, this tonic in tepid water is recommended by many European physicians:

Aromatic vinegar, 1 pint; tincture of benzoin, 1 wineglass.

A delicious bath used by our grandmothers, and that is as efficacious for their granddaughters, is made by boiling for three hours two pounds of bran. Strain the bran through a sieve. To the remaining liquor add some scent of your choice, let us say 10 drops of bergamot, 5 of rose of geranium, or 5 of oil of lavender.

A belle of limited means utilizes all the left-over bits of her toilet soap. These she grinds or chops with a knife into a fine powder. To two ounces of this powder she adds four tablespoonfuls of borax. She sifts these into two quarts of bran. A pint of this mixture poured into an old linen or cheesecloth bag and the bag used as a washcloth gives a pleasant touch of luxury to a bath, besides greatly softening and whitening the skin.

Many women prefer to make their own toilet or aromatic vinegars to be used in the bath. For them I recommend this formula:

Camphor, ½ ounce; oil of rosemary, ½ dram; oil of cloves, ½ dram; oil of bergamot, 1 dram; acetic acid, 4 ounces; alcohol, 8 ounces.

When for any reason the perspiration is odorous in spite of the bath, this sprinkled upon the offending portions of the body destroys the unpleasant condition:

Subnitrate of bismuth, 1 ounce; pulverized boric acid, ½ ounce; pulverized alum, ½ ounce; oil of eucalyptus, 10 drops; oil of rose geranium, 5 drops; oil of lemon, 5 drops.

For those of full habit I recommend a Russian bath once a week as beneficial to the complexion. I prefer those given in the cabinets. For myself, being meager, there would be after six of them nothing left.

Let me suggest this means for the invalid or the person of lean purse, of taking the Russian bath at home. There are inexpensive cabinets, folding or stationary, made for this purpose, of wood or tin. Even a packing box would suffice. But a good Russian, which

means vapor, as distinguished from the Turkish, or hot air, bath--and the Russian I think much to be preferred, because it does not involve breathing hot air--may be taken at home.

The home-made Russian bath requires: Three or more blankets; a cane-seated chair; a spirit lamp; a can containing one quart of water. Place the can upon the lighted spirit lamp, the spirit lamp beneath the chair, and yourself, enveloped in blankets, upon the chair. The water in the can can be replenished from time to time.

Drinking three or more glasses of hot water during the bath aids in perspiration. If there are more blankets available lie down swathed in from four to six dry ones, and the process of perspiration will continue for twenty minutes longer.

In Turkey baths are regarded not only as means of cleanliness but as agents of beauty. Here is a tonic Turkish women pour into the tub to tone the skin and through that the whole body:

Ammonia (pure), 100 grams; cooking salt, 500 grams.

This is of special value when one is tired and listless. It is called the Stimulant Bath:

Oil of turpentine, 100 grams; carbonate of soda, 50 grams; oil of rosemary, 10 grams; oil of eucalyptus, 5 grams.

This oil bath is rubbed into the skin to render it soft and smooth. It is an admirable remedy for a dry skin. The harem women style it “The Beauty Bath”:

Rosewater, 100 grams; glycerine, 60 grams; starch, 50 grams; oil of lavender, 15 grams.

Famous beauties were always careful about their baths, even in a period when baths were disregarded or were despised as the habits of the unduly effeminate. Marie Antoinette, for her full bath, used a mixture of wild thyme and marjory, with sea salt. In the winter the baths were taken cold, in the summer warm, it being the fancy of the court physician, Dr. Fagoni, that the temperature of the bath should correspond to the temperature of the outer air.

The wine bath is not a fiction of the imagination, but rather a fact of history. The beautiful Russian, Marie Czetwertynoska, favorite beauty of the Court of Alexander the Great, insisted upon the tonic of a weekly bath in Spanish wine. Poppæa bathed in asses’ milk, and was renowned for her complexion.

Novel was the method of Isabeau, Queen of Bavaria, for toning the body and beautifying the complexion in spring. Each morning during May, June and July she bathed in strawberry juice.

Mme. Tallien, whose skin was flawless, preferred raspberries, as at once milder in effect and yet of more lasting quality. Ninon de l’Enclos bathed alternately in chickweed water and milk, using oatmeal freely in her face bath.

Enid Wilson, often alluded to as “the most beautiful woman in the British Empire,” had a favorite bath, which she declared was the chief secret of her wonderful English complexion. “Into a wide-mouthed gallon jar I cram as many elder flower blossoms as it will hold. Over this I pour boiling water,” she said. “After letting the jar and its contents stand in a cool place for six hours, I strain the liquid and pour a few tablespoonfuls of it into my bath.”

The beautiful women of every civilized nation are nowadays taking less medicine and more baths. The medical directors, who are probably the greatest beauty doctors, because they teach that beauty depends almost wholly on health, are teaching them the tonic and sedative influences of the bath. They are teaching them that of varieties of baths there is no end. They tell them there is one sort of bath for the anæmic person, another for the too full-blooded person, one for the person who sleeps too little, another for the one who sleeps too much.

For every temperament and for every condition there is the special bath. But there are some general rules which all should know. For instance these:

The best average temperature for the bath is 68 to 72 degrees Fahrenheit. The temperature of the bath should always be tested before using.

The bath of cistern or rainwater is the best for the skin, because it is the “softest”--that is, the purest water, being unmixed with the minerals which well water collects on its tour through the various strata of earth, and which “hardens” it.

The starch bath is one of the best to allay itching or cure annoying skin eruptions. It is made like this:

Into a tub of say ten gallons of water drop one-half pound of starch.

The gelatine bath serves a similar purpose. It is soothing to an irritated skin. The proportions are two hundred and fifty grams of white French gelatine to ten gallons of tepid water.

The cold bath is a stimulant for those who are strong enough to react from it. The test is whether after the cold plunge the skin turns red. If it turns blue the vitality is not sufficient to bear such heroic treatment. Cold baths should not be taken without the advice of a competent physician.

The hot bath is soothing, but if taken too often is enervating. Once a week, under ordinary circumstances, is often enough for a hot bath.

The tepid bath, graduated to a cool bath by letting the cold water run in as the warm water runs off, is the best daily bath.

For the person who perspires excessively, a wineglass of ammonia to ten gallons of water is a good corrective.

For the seaside bath, five pounds of table salt dissolved in a tubful of water at home is a very good substitute. This, followed by a shower or spray, will lend the illusion of Ostend or Atlantic City.

But besides these simple baths, that any one may take, there are some that are complex, and that only those who have, for a time at least, some spare hours to spend at their toilets may trouble to take. This is what my physician ordered when I had come from a Russian tour, weary from travel and in that state of depression that follows extreme weariness. Used in tepid water every morning I found it invigorating:

Bromide of potassium, 1 gram; carbonate of calcium, 1 gram; carbonate of soda, 300 grams; sulphate of soda, 300 grams; sulphate of iron, 3 grams; oil of lavender, 1 gram; oil of thyme, 1 gram; oil of rosemary, 1 gram.

The same physician recommended for the skin that was too sensitive to endure soap:

Tincture of quillagac, 10 grams; glycerine, 20 grains; oil of bergamot, 3 drops.

The extremely nervous person, whose skin is much irritated, may take the starch bath I have described and add to it a pint of vinegar.

Discreet bathing, besides its first office of cleanliness, aids and even cures anæmia, biliousness, obesity, rheumatism, neuralgia and even St. Vitus's dance.

The hot water treatment for pimples is more efficacious than most medicines given for that purpose. The application of soft cloths dipped in hot water has effected a cure in a few days.

A class of skin diseases that produce postules on the skin, these postules eventually bursting and forming crusts, are alleviated and sometimes cured by a systematic course of warm baths. The falling of the crusts like dandruff, and the gradual healing, may be brought about by two warm baths daily. Tetter is one of these forms that has been cured by warm water baths and careful, tender drying with soft towels.

An object lesson in the value of the warm bath in soothing the nervous system is seen in the case of children screaming with the colic, who cease their cries and grow sleepy as soon as they are placed in a tub of warm water.

If possible, bathe not less than two hours before eating nor less than three hours after eating.

Never take a bath while very tired. There will be no reaction--that is, the blood will not leap to the surface as under favorable circumstances it makes its response to the bath, and the bath will merely reduce further the lowered vitality.

A little exercise just before bathing and a little exercise after, aids the good effects of the bath. The exercise before opens the pores for the reception of the water. The exercise afterward permits the entrance of sun and air into the pores too little accustomed to either.

Light exercise after the drying of the skin with a soft towel and before enveloping it with clothes is a splendid tonic and a wonderful beautifier. I know a half dozen beautiful Parisiennes who have had their bathrooms built in that part of the house most exposed to the sunshine, and at the top of the house, and, opening from these, have built small sun parlors, square rooms with roofs and sides

entirely of glass. Here they exercise for from five to ten minutes, jumping the rope or flexing the arms and legs and head. One vigorous beauty has a blanket spread upon the floor of her sun parlor, and upon this turns somersaults, to make her body pliant and to assure herself that her circulation is free. Some of these exercises are illustrated by the silhouettes on this page.

During the sunbaths they are unclad, or if clothed are merely wrapped in a light, loose dressing gown. After the bath and the exercise some Parisiennes repose for an hour upon a couch in the sun parlor, their hair hanging loose and their faces protected only by a delicate shade, like a fire screen, from the too strong rays of the sun.

Bathe briskly in the water. Never stay in it more than twenty minutes. Indeed, a good scrub can be taken in three minutes. A brush is better than a sponge. It pries open the pores. Do not use coarse towels. They abrade the skin. Use soft towels or bath gloves. Dry thoroughly and quickly. Many bathe the face and neck first to prevent a possible unpleasant dash of blood to the head. Bathe in a room whose temperature is at least 68 or 70 degrees. Ordinarily the room should be as warm as the water in which you bathe.

For those who dislike soaps, or if they do not dislike, at least distrust them, lanolin milk is a valuable aid or even a substitute for the bath:

Lanolin, 35 grains; water, ½ ounce; pure castile soap, 30 grains. Pour the lanolin into the water. Heat slowly. The soap should be dissolved in a half ounce of water. Mix and shake well.

Glycerine soap is one of the best for the winter. Those soaps containing bran and oatmeal are also excellent for preserving the softness of the skin in this trying season.

Almond meal poured into the wet hands and forming a paste, which is gently rubbed upon the face and hands, is the best substitute for soap for the face bath.

The ordinary daily bath is not enough for the feet, which are of coarser fiber. They have larger pores, from which much perspiration is discharged. And there is a greater discharge of dead matter from the soles of the feet than from any other part of the body of the same area. For this reason and because the feet are more exposed to dust than any other part of the body except the face, there should be a special daily footbath. It is best to take this just before retiring.

It is, by the way, helpful in calling the blood away from the head to the feet. I always take my footbath a little warmer than my body bath. I scrub them with a flesh brush well soaped, for there cannot, fortunately, be too much soap used upon the feet. A teaspoonful of borax or a teaspoonful of ammonia aids the cleansing.

CHAPTER XII

GOOD HEALTH AS A FOUNDATION FOR BEAUTY

Show me a woman who has indigestion and I will show you a person with muddy complexion, dull or feverishly bright eyes, a coated tongue and a languid manner.

None of these makes for beauty. All are signs of ill-health. Besides these outward and visible signs of ill health, it is a heavy weight upon the spirits. The girl thinks she is unhappy, and manufactures causes for misery, or exaggerates the trifles that are not to her liking, and makes them causes for unhappiness.

Besides these, indigestion causes yet graver troubles. I recall several persons I knew who have since passed from the earthly plane, whose decline in health began with various symptoms of indigestion. It was never clear to me whether the indigestion was the cause or the effect of these maladies. But I trust I have said enough to prove that indigestion is a most undesirable state. Vanity alone should forbid it.

How to prevent indigestion? I shall have a great deal to say farther on about food wrong in kind or quality as a cause of indigestion. But first let me tell you of an excellent exercise to discourage indigestion.

Knead the abdomen on retiring and several times a day when there is opportunity. Double your hands as though for kneading bread. Place the clenched hands beneath the ribs. Press firmly and regularly upon the intestines, moving the fists forward until they meet. Having done this five to ten times, allow the left hand to rest at your side and with the right hand press gently but steadily downward at the left of the abdomen until your hand is opposite the thigh. Repeat this operation several times each time you take

the exercise. This is still more effective if taken while you are lying in your bathtub. The relaxation of the muscles is aided by the fact that they are under water. The hydropathic school believes this one of the greatest aids to restoring proper digestion.

Much walking is an aid to digestion. So is this exercise, which can be taken in bed:

Lying upon your back, draw the knees slowly up beneath the chin, then let the legs fall to their former position. This is the most valuable of early morning exercises for those who have a torpid liver or some other form of indigestion.

Coarse cereals are an enemy to indigestion. Seldom does one see a case of indigestion in Scotland, and if we do, it is when we meet a queer Scot who dislikes his national dish, oatmeal. Oatmeal, whole wheat, rice, all being large fibered foods, stir the stomach and intestines to activity, which is good for digestion.

Again, every girl should know some of the principles of the values of foods. Apply to your daily food these facts. Your food should consist of these proportions:

Mixture of starches and sugars, about 16 parts. Proteids, 4 parts. Fats, 2 parts.

In other words, one-half of our daily amount of food may be made up of potatoes, rice, bread, etc. One-eighth should consist of the proteids, as milk, or eggs, or cheese. One-sixteenth should be fat, as butter or the fat to be found in meat or oil in dressing of salads. Keep this table in mind and you will find a new interest in choosing your food, and in a short time you will welcome a marked improvement in your health.

Do not decline sweets unless you are overweight, but eat them at the right time, which is as dessert for luncheon or dinner. Never eat cake or candy between meals.

Turn resolutely away from all fried foods. You have heard that fried foods are injurious, but you do not know why. It is my pleasure to tell you. They are indigestible because they form in the stomach a substance as thick and unwieldy as leather, and as difficult of digestion. Neither meats nor eggs nor milk should ever reach the boiling point. For this reason never eat boiled beef, nor a boiled egg, nor milk that has been boiled. The beef cut up in a stew that has simmered below the boiling point, an egg that has been dropped into water just below the boiling point and allowed to heat there for eight minutes instead of boiling four, and milk that has been heated but never permitted to show one of the bubbles that attend the boiling state, are substitutes for the old forms, and admirable ones.

Keep this also in mind in selecting your food: For the bones' formation we need lime, and the cereals, as oats and wheat and rice, contain elements that make it. Sugar is converted into energy, as the Russian dancers well know, for they eat inordinate quantities of candy and sweet paste, yet, because they exercise it off, remain thin. The fats, as butter and meat fat, cause warmth in the body, so should be used more freely in winter than in summer. Bread is a good food if made of coarse grain. Contrary to the general opinion, macaroni and spaghetti are good foods. Examine them in their raw state and you will see that they are yellowish. That shows the presence of gluten, which is valuable as an aid to digestion, in bread form.

Are you anæmic? Then besides mild exercise in the open air, always stopping before you are tired, and massaging the body and face with feeding oils as lanolin and olive oil, feed yourself generously with thickened broths and thick soups. Ham and bacon and mutton, chicken and game are rebuilders of the weakened system, and butter may be freely eaten. For the anæmic all kinds of fresh fish are nourishing. So are oysters. Eggs are rebuilding agents. So are bread and cakes, tapioca and hominy.

Much cream is desirable for the anæmic, and chocolate, custards, baked fruits and jellies are friendly foods in the circumstances.

Avoid what especially taxes the digestion, as veal or pork, salt meats and heavy hashes. Bananas being among the most indigestible of the foods, should be avoided.

If you are dyspeptic don't eat many things at one meal. Two or three dishes are enough. If you have difficulty in digestion lie down before or after a meal. For you vegetable soups as tomato, asparagus, pea and bean soups are aids. Oysters and fresh fish, plainly broiled, are among your dietetic friends. Squabs and sweetbreads and chicken that has been broiled are best. Your meats should be short-fibered and broiled until they are tender. Eat eggs with stale bread or dry toast. Eggs may be cooked in any way you wish except broiled or fried. Do not eat meats freely, and if you eat any butter let it be very thinly spread. If you eat bacon be sure that it is crisp and thoroughly done.

Well baked potatoes, tomatoes and spinach and boiled onions, peas, lima beans, asparagus and stewed celery and lettuce are edibles you should choose. Do not eat fruits that are either very sour or very sweet. The stomach of the dyspeptic is sensitive to extremes. Tea, if made very weak and drunk clear and hot, is beneficial. So are milk and cocoa or chocolate, if not too rich. Shun raw celery and cabbage and radishes.

If you are gouty or rheumatic be careful not to eat stimulating foods and avoid all stimulating liquors. The gouty or rheumatic condition is caused by the deposit of acids in the joints, and you should study how to eliminate these from the body. Alcohol, sweets and strawberries add to them.

Eat very slowly of the following: Thin vegetable soups, fresh fish and raw oysters, whitemeats, as the breast of chicken, sweetbreads and pigs' feet. Take the whites of eggs, preferably raw.

Toasted graham or whole wheat bread is the best for your condition. Zweiback and graham gems are also helpful. For you celery, lettuce, cucumber, cabbages, young peas and string beans, spinach, those vegetables containing much water, are excellent. Juicy fruits as oranges, lemons, apricots, cranberries, pears, peaches, better stewed or baked than raw, are medicinal for you.

But eat no beef, no fried dishes, no ragouts nor hashes, neither turkey nor duck nor goose, no omelettes and no salt fish and no desserts except fruits. If you drink tea or coffee let it be weak. Buttermilk is better for you, and you more than any other class of person, should drink water in large quantities.

If you are liverish or are troubled by bilious attacks eat less heavily than you have been doing. Choose white meats and fish, and eat no fat part of the meat. Of vegetables eat much watercress and lettuce and spinach. Drink skimmed milk and that very slowly, and eat only raw or poached eggs. Cornbread or bread made from whole wheat flour and hot water in which you have squeezed the juice of a lemon or orange will help you back to a state of health. Eat neither cheese nor potatoes, oatmeal nor dried vegetables.

If you are neurasthenic never attempt the no-breakfast plan. It is better for you if you can have your breakfast in bed. The diet should be light. Meats, fish, eggs, green vegetables and fruits are a helpful diet. Milk can be taken if the stomach does not reject it. Tea, coffee, tobacco and alcoholic drinks are forbidden to you.

Train yourself to note your symptoms and treat them by diet. When your face has a mottled appearance you may be sure that you are eating too much food of all sorts, or that you are eating too much that is greasy or rich or sweet. A chic Parisian friend of mine when she notices such symptoms limits herself to one moderate meal a day--her dinner--and the earlier part of the day contents herself with fruits and salads, drinking water moderately at these meals and copiously between them.

There are many times when we "feel our bodies" and are growing too heavy or too lazy that it is well to subsist for a few days on a liquid diet. This nourishing drink strengthens the body even while the work of removing the remaining ashes from the body goes on:

Whole barley, 1 tablespoonful; a slice of lemon; boiling water, 2 cupfuls. Place the barley and slice of lemon in an earthen dish. Over them pour the boiling water. Cover the dish and let the mixture stand for ten minutes. Then strain into another earthen dish. The drink may be flavored with a small quantity of sugar if preferred. The quantity given is ample for one nourishing meal for one person.

This is a drink often taken by athletes to refresh them during their training period in England, but is useful to women taking a semi-fast for beauty's sake:

Bran, 2 tablespoonfuls; seeded raisins, 1 tablespoonful; lemon, 1 thick slice. Chop the raisins fine and place them with the bran and lemon in an earthen bowl. Over these pour a half pint of boiling water. Let stand to cool and blend for ten minutes. Strain and drink while warm. Raisins are of special value in cleansing and toning the kidneys.

The water in which peeled apples have been stewed and to which a few currants have been added is a strengthening, cooling and cleansing drink. It is made more appetizing by the addition of a few cloves or a broken stick of cinnamon.

This is another tonic and refreshing drink during the time when you are eating little, or nothing:

Squeeze into a large coffee cup the juice of one orange. Fill the space remaining in the cup with boiling water. Add a teaspoonful of liquid honey and the same amount of lemon juice.

This, too, appeases hunger:

Milk, 1 pint; hot water, 1 pint. Slowly sip in lieu of a meal. The use of water in a way prevents the clogging of the system that sometimes follows an exclusively milk diet.

A drink much in use in England, that is half food, half medicinal, is this:

Two tablespoonfuls of whole wheat; a little caraway or celery seed to flavor. Into a pint bowl of boiling water stir the whole wheat after it has been ground. Add the caraway or celery seed. Sweeten, if you wish, with a half teaspoonful of powdered licorice.

Nut drinks are among the strengthening beverages substituted for food during a beauty fast. For example, this:

Ground peanuts, 1 tablespoonful; boiling water, 1 cupful. Flavor with equal quantities of honey or lemon juice as desired.

Perhaps you prefer meat juices in the thinning or rebuilding time. In that case:

Pour over finely chopped beef or chicken twice its bulk in boiling water if you wish the tea to be strong, three times if weak.

Some things there are that no one who wishes to be beautiful should ever take into the stomach. Those things should be contraband, as poisons and leads. They are: Sweets, pastries, anything very sweet or very sour, anything very cold or very hot, pork, puddings other than those consisting chiefly of fruits, and the doughnut, or cruller, which is fried dough.

I hear American women beseech me, “Tell us what to eat and what not to eat, so that we may be thin.” I answer, “Eat foods containing cooling properties, as limes, soda and acids. Do not eat what contains sugar, fat and starch.” Shall I be more explicit? Very well, then. Choose for your regular diet:

Green vegetables, boiled without grease and with a little salt; string beans, peas, asparagus and spinach may be cooked in this way or dressed with oil and vinegar in which vinegar largely predominates; stewed fruits, as apricots, prunelles, apples, kumquats, cherries and plums, with little sugar, better with none; lean meats, rare beef and mutton, roasted; zweiback or gluten bread, or, if these be not available, then the crust, never the inner portion of wheaten bread; green salads, as lettuce, romaine, chicory or cucumbers, with French dressing, reducing the usual amount of oil and increasing that of the vinegar.

Eat as little as you can subsist on and maintain your strength, of any of these. Remember, that while the stomach of each adult equals in size that of a quart measure, it is wise to only half fill it; that is, to take into it at no time more than a pint of food or fluid, or of both combined. The distended stomach causes many intestinal troubles. One of the results is that always unsightly spectacle, a high abdomen.

Foods it is wise for the stout beauty to avoid are: Fat meats, gravies, pastries, cauliflower, potatoes, rice, lima beans, chocolate, sweetened tea or coffee, candy, puddings and milk.

The beauty with the persistently blotched skin requires different food, less food, a more judicious dietary. For her skin indicates some form of indigestion, and the first step to cure indigestion is to give the digestive apparatus less work to do. For that reason I should advise the beauty with spots upon her countenance to try for a few hours, or, if possible, a few days, the water cure. Let her, so far as food is concerned, fast, if her physician permit, and live as long as seems judicious on air and water. The furnace of an engine must be cleansed occasionally of its clinkers. So the intestinal tract must be cleansed of its obstructions. I have said before in these pages that everyone should drink three quarts of water a day. I repeat it. If the stomach be very delicate the water may be taken hot, but, as I have also said before, I have found that, while hot water taken copiously into the stomach relieves a condition temporarily, if the stomach continues habitually to be flooded with it, it checks the flow of the gastric juices. The gastric juices refuse to work, pettishly leaving their functions to the intruder. Cold or cool water--never, let me repeat, ice water--should be taken so that when it reaches the stomach it is of nearly the same temperature. It should be sipped and slowly swallowed; never, no matter how thirsty one may be, gulped.

As well introduce a lump of ice suddenly into the stomach as a tumblerful of cold water. If you have ever by accident swallowed a lump of ice you know how painful and violent is the stomach’s protest. Never drink more than two glasses of water at a time. A pint, as I have pointed out, is all that the stomach should be asked to retain at one time. If the beauty, the charm of whose face has been eclipsed by blotches, desires, she can increase the amount of water by a quart or more, but this only when she is taking no food. If she finds it more palatable, three or four drops of lemon juice squeezed into a glass will help the cleansing process. While she is taking the water cure she should take as much exercise out of doors as her strength will permit. She must not continue the exercise

after she becomes tired.

This water cure can be assisted by flushing the colon with warm water, a subject with which I may deal more fully later. Sufficient at this time that the internal bath, given as often as her physician directs, is of great aid to her who would have a clear complexion.

The water and air cure has been continued, under medical direction, for one day, three, even five or six days, with beneficial results. The length will depend upon the strength of the person taking the cure. When she resumes food she would do well to begin with warm milk.

Beginning with one quart of milk a day, the quantity can be increased to two and even three. It should be remembered that milk is food, rather than a beverage, and should be consumed as such. Not less than five minutes should be given to drinking a glass of milk.

When food has been resumed bear in mind that if the spots upon your face are caused by acne (blackheads) tea and coffee should be avoided. So should pastry, cheese, sauces and highly-seasoned foods. On the other hand the beauty who would remove the small, black blemishes may eat freely of well-cooked green vegetables and stewed fruits. While following this cooling, cleansing régime, I would suggest that pimples, roughnesses and spots will the more quickly disappear if for three or more mornings the blood be cooled by a dose of one teaspoonful of Epsom salts in a glass of warm water.

For the beauties who are too thin a diet that will enrich the blood is recommended. For this condition fat meats, gravies, lima beans, potatoes, rice, sweets--all those things above which I have written the flaming sign “Don’t” for stout beauties--should be eaten.

When the cheeks and lips are pale, the eyes dim, the gait lagging and the body abnormally thin, these conditions all indicate that there is a lack of iron in the system. I use iron hypodermic injections myself, preferring them because they save the stomach the disturbance that follows introducing medicines. But if there is an objection to this iron may be taken in food form by eating the yolks of eggs, spinach, beets and string beans.

The same dietary will help the woman whose hair is falling or is prematurely gray. The results, though slow, are beneficent.

I believe in fasting in moderation as an aid to the good health upon which beauty depends. As fully as I indorse the beauty device of staying in bed now and then for a day or longer, if circumstances permit, one day of every ten, I am convinced that an occasional fast is conducive to well being.

Fasting confers benefits in general and in specific cases. When persons are in that condition for which you have a naïve word of description, “logy,” which means heavy and listless, fasting serves an excellent purpose. Usually the “logy” person has been overfed. Let her go back to nature for a lesson on how to cure herself of this disorder. When an animal has eaten too much it usually crawls away to some dark and quiet place and fasts. That is what the woman who has overtaxed her digestion should do. At such times the animal drinks plentifully of water. So should the human being.

When the digestion goes on strike humor it. Grant the overworked stomach and intestines a holiday. Let them suspend work for a time, but only for a short time. Better, in my opinion, a forty-eight hour fast taken four times a month than a fast taken for eight consecutive days.

In general, the body is better off for an occasional relief to the digestive organs. But there are specific instances of the fast being of great benefit.

For instance, I know a woman whose beautiful figure was seriously marred by an enlarged abdomen. When she came to me for advice I asked her to stand and to walk. I saw that she stood and walked well. Then I asked her to sit, and I saw that her habit of sitting was correct. She sat with her weight equally distributed and resting evenly on the balls of her feet. She sat somewhat, though not awkwardly, forward in her chair, so that her spine was straight. In none of these postures was there any cause for the thrusting forward of the abdomen. Her corsets were good and new, neither too tight nor too loose. Believing that this puffy, vulgar appearance was due to some form of indigestion, I suggested a short fast. I recommended forty-eight hours without food and with plentiful drinking of hot water, into each glassful of which was squeezed the juice of a lemon.

She repeated this every week for five weeks, with no unpleasant results and with the flattening of the abdomen which she desired and which has greatly added to the loveliness of her figure.

There is much in favor of the semi-fast, which is not so great a shock to the system. When persons have passed their thirty-fifth year it is wise to give no such shock to the system. Better be as considerate of our own bodies as we are of the feelings of our beloved friends. Begin gently any radical departure in the habits of the body. For this reason it is well to begin fasting by semi-fasting, or by gradually diminishing the amount of food taken.

A plan that seems to me worthy is to forego solid foods, and the first day subsist on milks, gruel or soup. Of these the milk is better because more nourishing. Some persons don't like milk, but, it being the natural food, everyone can train himself to like, or, at least, to swallow it. Some to whom milk is repellent prevent its unpleasant after effects by placing in each glass a pinch of bicarbonate of soda.

I allow my appetite to govern the amount and the frequency of these meals of milk. I always remember that milk is food and so consider that I eat, rather than drink, it. Five minutes at least for a glass I always permit myself. Sometimes I take ten.

The stomach having been gently prepared for the change, it is ready by the second day for the water and lemon. The lemon juice not only makes the water more palatable, but it stimulates the liver, so clearing the complexion.

When ready to break the fast I have found it well to accustom the stomach to the change back to food by sipping orange juice that has been pressed into a cup or glass, then to begin eating again by consuming a small, sweet orange. I returned to regular diet by the easy way of soups and gruels. My longest fast was for four days, and I consider that one or two days too long.

In fact, the safest method of fasting I consider the semi-fast, with milk, gruels and soups that I have described.

Thus of the manner of fasts. Now as to their value. Catarrh I have known to be greatly relieved, if not wholly cured, by recurrent fasts. Rheumatism in its early stages has yielded to repeated short fasts and care to avoid sweets and beef in the intervals between these fasts.

Even nervousness, that form of it which is aggravated by rich and heavy foods, I have known to disappear during one of these silent and dark room fasts, the silence and rest being, probably, the chief agents.

A fairly good rule to follow is that whenever the tongue is coated the amount of food may be reduced, or we would do well to have no food for a short time. The coated tongue indicates that there is much dead, refuse matter, like the choking ashes in a furnace, obstructing the body. If you can fast until the tongue is once more clean and red you will be the gainer.

Also when you feel your body, that is, when you are unpleasantly conscious of its weight and its handicap, a fast will usually relieve you. But a warning. Do not undertake a fast while you are doing your heaviest work. Fast when the demands upon you are lightest, and fast, if possible, alone, so that no one will be afflicted by the irritable temper that is liable to follow.

No one looks her best when she has not had enough sleep. Little lines come about the eyes, deep creases form in the flesh about the mouth, the eyes lose their light, the facial muscles their firmness, the complexion its freshness, and, what is most important, the mind loses its alertness, when we have not slept well. Irritability and supersensitiveness show in face and manner.

Lack of sound sleep is due to two causes, a brain under-nourished or over-stimulated. Sleeplessness, or fitful, restless sleep, follows nervous derangement. There may be indigestion, cause or result of nervousness. There may be worry. There may be mental fag or nervous exhaustion. But whatever form it takes the root of the matter is nearly always in the nerves. This granted, we must look to relieving the brain, the main station along the line, or we must supply it what it needs.

Banish worry. Take plenty of exercise. Breathe much fresh air. These are three excellent recipes for sleep.

If you find that you have been over-working, lighten your work a little. Try to spend a day or two in the country, if possible. But this, to a busy person, is sometimes out of the question. If that is the case with you try to retire an hour earlier. Some dread retiring earlier because they say they know they will not sleep. Try it at any rate. Lying in a dark room will bring a sense of rest that should soothe the nerves and tend toward sleep.

Make sure that the room is at the right temperature for your comfort. If it is too warm you will surely not sleep. If it is cold to the point of discomfort, you will lie awake. Sixty degrees Fahr., or less, is a good temperature for a sleeping room. Be sure that the air of your bedroom is fresh. If it seems stale or stuffy open the windows wide and either move actively about the room or go into any other one while this freshening is taking place. It would be much better if the airing had continued all day and the air were as near the freshness of the out-of-doors as you could make it.

If your head aches from the strain of the day, a bandage of cracked ice should drive the excess of blood from the head and permit sleep. If, on the other hand, you are anæmic, and your feet are cold at night thrust them into a tub of hot mustard water. Place the elbow in the water first to test its temperature. If it is too hot for the elbow it will certainly be too hot for the feet.

If you are annoyed, while lying awake, by a gnawing of the stomach, proving that it is quite or nearly empty, forestall this by sipping a cup of gruel before going to bed. This will warm the stomach and quiet the nerve disturbance, soothing the body for its rest.

A case of protracted insomnia I knew to be cured in this simple and, it would seem, did I not know the results, trivial manner. Lie flat upon the bed with a low pillow--or, better, no pillow at all--and loosen your grip upon your muscles. Uncurl them, so to speak. Relax as completely as does your house dog when he sleeps with his body stretched out, nose upon his paws, before the fire. Then breathe very deeply but gently counting six at each respiration. To aid in this deep breathing, press one nostril shut by laying the forefinger firmly against it and drawing the air through the other nostril. Repeat this a half dozen times, counting six at each drawing in and letting out of the air.

Call into use the hot-water bottle or the warming pan. Put on your bedroom slippers if you awake with cold feet. Pretend that you are sleepy, even though you are not, and let the eyelids slowly close as though drooping from their own weight or from weariness, over your eyes. This little device alone has been helpful in cases of insomnia.

The Orientals give us good advice concerning sleep: “Compose yourself. Be calm. Think on pleasant events before falling asleep,” say they, “for upon whatever plane of thought you enter sleep you will remain during your slumber. And those thoughts will stamp themselves upon the face.”

One of the greatest menaces to feminine beauty to-day is nervousness--nervousness in all its forms, neuritis, neurasthenia, nervous prostration, hysteria. All these prove that the little silver wires have been drawn too taut and that they are at the snapping point.

Old age is the specter that stalks in the path of beauty. It is the only thing of which beauty is afraid. But nervousness presages age and the appearance of age. Observe one of your friends after a nervous attack. She looks ten years older. The tumult of her emotions has etched ugly new lines in her face, from nose to lips, along the temples and between the eyes. If she catches sight of her face in the mirror at such a time she is appalled, for she has a vision of the sort of old woman she will become.

To keep young, discourage very nervous outbreak. Every woman needs a calm mental center. She must have some place of spiritual and mental retreat from her tumult of soul if it is only the reflection: “In a year it won’t matter.” She should fly to this whenever a tumult of the nerves threatens. I know a woman who cured her habit of flying into tempers, which is only another expression of jangled nerves, by saying over and over to herself:

“It is vulgar to show temper. Whatever else I am I will not be vulgar.”

Her face, which had begun to show the etching of deep, stormy emotions has become a smooth, beautiful mask, whose expression lies where expression should, in the flash of a sudden smile and the quick lighting of brilliant eyes.

Need I recount the symptoms of disordered nerves? Not to mature women. They know them too well. But for the benefit of my younger readers to whom nerves are yet happily only names, I will describe a few.

Irritability of temper is one, the most common, and the one which occasions the least sympathy.

Exceeding sensitiveness, which makes the person prone to take offense when no offense is intended, is another.

Depression of spirits as often results from tired nerves as from an overburdened liver.

The habit of “making monkey faces” which I have so often noticed in American women.

The habit of making many and needless movements. The girl who flings her head aloft in aimless little gestures may think she is vivacious, but vivacity is rather of the mind than of the body. She is merely revealing the unpleasant secret that her nervous system is impaired.

Capricious appetite is one of the symptoms. The nervous patient eats either too little or too much, and she may eat too little breakfast and too much dinner on the same day.

Insomnia is a sure and serious sign of derangement of the nerves.

The inability to sit still for a considerable time is still another and very bad sign that the nerves are as you say here “ragged” or “jumpy.”

I have seen one of your most distinguished and beautiful women suffer from this inability while at the theater, and to preclude jokes by the paragraphers, I will explain that it was at a very good play, where no person in the normal state could possibly be bored. I have seen her lovely hands twitch in her lap. I have seen her knees create a silken tempest among the folds of her gown. Into her face I have seen “that worried look” come, the look that so disfigures the average American face.

This overwrought state of nerves has many causes. Sometimes it is a bad heredity. The daughters of men with the alcoholic habit, of overworked and over-worried financiers, often suffer from this predisposition of nerves. The daughters of fashionable mothers who laced too tightly or who followed the will-o’-the-wisp of society too persistently for their health’s sake, often so suffer.

Stimulants taken by the victim herself often produce it. Beware of these stimulants in many guises. Some of the headache powders open the gate to acute nervousness. Don’t use any without your physician’s endorsement.

But I believe that the chief cause of nervousness is intemperance, not of alcoholic or other stimulants, but of mental habits. Worry causes a thousand breakdowns. I never knew work to cause one.

For those symptoms of nervous affection which I have mentioned I have tried home treatment with success. One of the best methods has been stretching. Standing on my tiptoes, raising my heels far from the floor, standing as nearly in that straight line from toe to knee which Genee does so admirably, as I can, I stretch and stretch my body, fancying I am an India rubber woman and getting great fun out of trying just how tall I can make myself. Sometimes I raise my arms above my head with finger tips extended, and play again that I am trying to reach the ceiling.

The value in stretching is largely in the pleasure one gets from it. For this reason I never continue one posture after it has become tiresome. Dropping to my heels and standing with my soles flat upon the floor, I stretch the arms out at right angles with the sides. The fact that one is always moved to yawn with this exercise shows that it is valuable. For yawning is nature’s violent means of ridding the body of an excess of impure air and securing a new supply.

If you can yawn naturally, do so while stretching or at any other time. If you cannot yawn naturally, yawn artificially--that is, simulate a yawn. It is at least as helpful to respiration as the Turkish bath is to perspiration. They are both substitutes for the natural process.

Lettuce salad, both at luncheon and dinner, or raw onions eaten with bread and butter at night before retiring, calm the nerves and aid sleep.

Light--that is surface--massage is a good corrective for nervousness. Deep, seeking-the-bone massage, which is used for liver complaint and for obesity, is too severe for the nervous patient. Besides, so many of the nerves lie near the skin that the region of the skin is the real seat of operations for cure. Light massage by coaxing the blood to the surface and inducing a new and stronger interflow among the nerves, feeds and strengthens them.

Electrical treatment applied to the seat of the nervous affection, as well as to the spine, is a means that has stimulated many depressed, nervous patients. This I advise only under the supervision, or at least by the direction, of a physician.

Long walks, and for disturbed nerves walking is better than driving, have cured many cases of nerve exhaustion.

Cold plunges or showers are recommended by many physicians for diminished nerve force. But the patient should be sure the advice is adapted to her individual case, and she should be sure of her heart. Neither the plunge nor the shower should be taken until a physician has prescribed them.

Cold sprays upon the spine given at Turkish baths are tonic to the nervous system. They, too, can be applied at home. The rubber tube fixtures for a spray can be bought for ninety cents, and can take the place of the expensive shower attachments.

For tic douloreux, for pains at the ends of the nerves, for spinal affections and for vertigo, one needs the aid of a physician. But in all nervous affections we must aid the physician by intelligent care of ourselves and conservation of our energies. Never waste your nervous force by unnecessary movements.

Deep breathing is helpful in correcting a nervous tendency, and improving the general health. This is no strange or obscure act. It is simply breathing as deeply as you can, from the very depths of your being, “clear to your toes,” a little girl put it--not breathing shallowly from a space somewhere near the collarbone.

I always recognize a shallow breather at sight. Usually she is round shouldered. Always she has a pale skin, pinched nostrils, dull eyes and a languid walk. Always she has little or no magnetism. The magnetic person is one who is most fully alive.

But how to acquire the habit of deep breathing is the important thing. Summon imagination to your aid. Stand at the open window or go to a garden or to a roof where the air is purest, and imagine that you smell the fragrance of a rose. Determine to draw into your being all the fragrance you can gather.

Stand erect and draw in as much air as your lungs seem capable of holding. Hold that breath; that is, keep the air in the lungs so that it may do its cleansing work, while you count five. That is equivalent to five seconds. Gently empty the lungs of the air. Then slowly fill the lungs again, hold as long as you can and slowly expel the air. You will learn to hold the breath longer and longer. Expert and experienced deep breathers can hold the air newly taken into the lungs for fifty seconds. But no beginner in the art should expect, nor try to do this. At first the practice may cause a sensation of dizziness. But this is not alarming. On the other hand, it is encouraging. It means that the poor, pale, ill-nourished brain is receiving as large a blood supply as it needs and it will soon become used to your new generosity.

If you are not so situated that you can get to a garden, a roof or open window, try to go alone to a room where you can recline for a few minutes. There let the muscles become limp. Folding the arms above the breast or clasping the hands loosely above the stomach will aid this.

To be sure that both nostrils are doing perfect work, press one shut by placing the finger against it and breathing through the other. Generally you will discover that the left nostril draws a larger volume of air through it than does the right. I have noticed it very frequently while doing my deep breathing.

Test the correctness of your breathing by placing your hands against your abdomen. If its walls rise and fall regularly and in obedience to every breath, you are doing deep breathing. If not, you have not mastered the art.

In two weeks, by repeating these exercises six or eight times a day for two or three minutes each time, you will not only have learned how, but you will have derived such benefit from it that you would not ever forget giving up so healthful and improving a practice.

What does it do for one? I can hear as an echo this question, impatiently put by practical American women. That is the feminine variation of the question often heard in America: “What do I get out of it?”

You get out of it free, well developed lungs. You get chest expansion. You get, if you begin early enough, immunity from that dread disease, tuberculosis. You get quieted nerves and an improved temper. You get pure blood which will make your complexion clear. You energize the whole body and stimulate your vital forces.

CHAPTER XIII

HOW TO ACQUIRE A PLEASING VOICE

If you would have a beautiful voice shun its two greatest enemies, coryza (cold in the head) and the evil emotions.

Every woman would have a beautiful voice, for it is indeed one of the most excellent things in woman. To my mind it is the most desirable possession in the world. But then I am a singer. I wish only to be a singer. If the singing voice were denied me I should choose, if I might have my choice, first a lovely face, then a lovely figure, and third a charming speaking voice.

There have been beautiful women without agreeable voices, but never a fascinating one. The voice rather than the eyes is the seat of magnetism. Many a plain woman has enjoyed that invaluable gift of personal magnetism and students of character have been baffled by it until they guessed the riddle of her voice. Plain women with low, well modulated voices with the heart note in them, are more dangerous rivals than pretty women who screech as peacocks. Painfully often the pretty face and figure are accompanied by the harsh, squeaking voice. The reason is the same that exists for the fact that pretty women seldom cultivate the power of charm. Content with what nature has given them, they make no effort to be responsive or entertaining. Their voices fall gratingly upon all

ears but their own, which have been dulled by praise of their natural beauty.

Every woman may not have a sweet voice, but every woman may have an agreeable one. The pleasantest speaking voice is more often made than born. It is susceptible of cultivation.

The uncultivated voice reflects the emotions as candidly as the eye mirror forth the soul. Culture of person and voice gradually suppress, or at least restrain, this faculty. If the voice be pleasant it should reflect only pleasant things. This, let it be understood, applies only to the speaking voice. I am not giving in this article a singing lesson.

Anger, suspicion, jealousy, covetousness, if they be felt, must be imprisoned in the spirit. As disfiguring to voice as face are these which have been called “the dark emotions.” If they cannot be eliminated from the soul they must be driven out of the voice. The dark emotions make the voice harsh. The silly emotions make it shrill. Mental and character poise are the father and mother of the beautiful speaking voice.

Coryza (cold in the head) is a menace to the voice. Hoarseness hides the beauties of a voice as a thick veil the face of a woman. Colds should be avoided. Or having been contracted, they should as quickly as possible be cured.

Many women of full habit who, as they say, “feel a cold coming on,” go immediately to the Turkish baths, and by drastic treatment rid themselves quickly of it. This, if followed by great care to prevent catching a fresh cold immediately after the bath, is a good remedy. So, too, is the ancient one of retiring early and with many blankets added to the usual amount of bed clothing to coax a heavy perspiration. This can be greatly aided by the other old-fashioned remedy of a glass of hot lemonade. A moderate dose of quinine is also effective in “breaking up a cold.”

The roots of the disease having thus been plucked up, the accompanying ugliness caused by rheumy eyes, swollen, scarlet nose and “running” nostrils, can be gradually cured by inhalations and gargles.

A yeoman remedy is the sniffing into the nostrils of quite strong salt water. Another that is excellent is the sniffing of pulverized camphor. A third is a nasal sweeping by the inhalation of ammonia.

Strong aromatic vinegars serve the same purpose. This is a valuable one, agreeable and less expensive than the elaborate one used by the beauties of the French court:

Glacial acetic acid, 1¼ ounces; rose water, 2½ ounces; lavender water, 1 pint.

This is powerful as well as pleasing and will reward the user for the pains of mixing the many ingredients:

Glacial acetic acid, ½ pound; rectified spirits of wine, 1 ounce; oil of neroli, ¼ dram; oil of allspice, ¼ dram; oil of lavender, ¼ dram; pure oil of cinnamon, ¼ dram; oil of bergamot, ¼ dram; oil of rosemary, ½ dram; oil of cloves, ¾ dram; pulverized camphor, 1¼ ounces. This is very strong and age makes it stronger. It is most advantageously used by pouring a few drops of it upon a silk sponge and inhaling. Avoid its contact with skin and clothes.

A third tonic vinegar useful for inhalation is this:

White vinegar, 1 pint; extract of lavender, 15 grams; oil of bergamot, 6 grams; oil of citron, 5 grams; tincture of benzoin, 6 grams.

Sage tea in which a small quantity of eucalyptus has been distilled is excellent for cleansing the nasal cavities after a cold.

Beauties of many courts and times have removed the husky quality from their voices by inhaling the vapor from a concoction of:

Sweet milk, 1 pint; ripe figs, ½ dozen. These should be boiled to a pulp and inhaled while hot. The mixture can be heated again and again and the vapor from it inhaled, until the cure is effected.

I am glad to see that fig and apricot paste has been imported from the Orient, for Persian women have successfully used this jam-like confection and medicine for many generations for the cure of hoarseness.

Weak elderflower tea is an admirable remedy. An infusion of chickweed is also recommended. These latter should be inhaled. The fig and apricot paste is, of course, for internal use.

Mme. Pompadour, the famous French beauty, used to clear her voice of huskiness by inhaling the fumes of:

Pulverized myrrh, 1 ounce; amber, 50 grains.

A husky voice indicates that the throat is dry. Our ancestresses knew this and made their children drink much sweet milk or buttermilk to remove hoarseness. The poor singer seeking relief from that distress by sucking a lemon has been a subject for caricaturists for twenty years. But the ludicrous practice has a basis in common sense. A lemon is a broom for the throat. A raw egg beaten with the lemon juice serves that purpose and is soothing to the burning throat.

While I was singing in Philadelphia I acquired a bad cold. One of the old families who had always extended me the courtesy of their home and friendship offered me a cough syrup they called “Stewed Quaker.” It was so quickly efficacious that I asked for the formula. Here it is:

New Orleans molasses, ½ pint; butter, 1 tablespoonful; white sugar, 1 teaspoonful; vinegar, 1 tablespoonful.

Cold compresses often cure a sore throat over night. Into ice cold water dip a fold of cotton cloth. Wring it out only dry enough to prevent its dripping. Pin this tightly around the throat with safety pins, and over the compress pin a fold of flannel. Soon the heat from the neck causes vapor and “loosens the cold.” In the morning remove the compress and massage the neck with olive oil.

If you value your voice try to avoid that protracted unpleasantness which is known as a summer cold.

To best understand how to prevent a cold, let us perfectly understand its causes. I say causes, not cause for an authority on the subject has recently said that there are four conditions that bring about the annoying and dangerous condition we call “a cold.”

There must be lowered vitality. In other words, a person may be in that state we describe as “run down.” When we are run down or “seedy,” as they say in England, our resistance is lessened; we are like a besieged town whose walls are falling. In this unprotected state we have little chance against a cold.

A similar condition is fatigue. We are more prone to catch cold when we are tired, because the good white corpuscles in the blood, the body’s defenders, are lessened by weariness. Also fatigue creates an excess of certain gases in the body, carbonic acid gas among others, and these self-poisons weaken the body and open the doors to cold.

Now, how to prevent a cold. Keep your liver active. If it becomes lazy take plenty of exercise to stir it into activity. If the liver is torpid, the poison it should take care of is cast upon the mucous membrane, irritating it and causing catarrh.

Be sure that your digestion is the best and that the intestinal tract is kept clear. Unless you do this there may be an irritation of the lining of the intestines that will cause all of the alimentary tract to become catarrhal. This, in turn, will extend to the nose and throat. To avoid indigestion, be careful that you eat only nourishing foods. Tuberculosis is more common in the poorer quarters of every city, especially of London, and physicians have concluded that this is not because they do not have enough to eat, but because they eat too many starchy foods, as pastry and potatoes, and too many sweets, as candy.

Prevent a cold by activity. Why do you catch a cold when you lie down without any covering except the garments you are wearing? Because when you are inactive your body is relaxed and the temperature is lowered. Exercise much, keep the blood flowing briskly, and you will generally avoid colds.

But be not satisfied with avoiding stagnant blood. Avoid stagnant air. Keep the air circulating in the room you occupy. Try to keep a stream of fresh air flowing through your room. At any rate, keep the window open two or three inches at the top, no matter what the weather.

Cold plunge or shower or sponge baths harden the skin and help to make one immune from colds, but before beginning to take them ask a physician’s advice. You may not have enough vitality to endure the ordeal. If you have your physician’s “O. K.,” the best time to begin is in the summer.

Avoid coughing when you can, for coughing is sometimes merely a nervous habit. Besides, a cough irritates the lining of the throat.

The old-fashioned remedy for a cold, of swallowing a mixture of equal parts of vinegar and molasses, is as good now as it was when our grandmothers dosed us plentifully and effectually for hoarseness. A pleasanter and perhaps more refined remedy is the plentiful use of honey. Use it freely on bread or with rice at table and swallow a tablespoonful of it whenever between meals you feel the tickling sensation that precedes coughing.

Gargling with strong salt water often clears the throat, saving fits of violent coughing.

A good method, and a simple one, of relief from violent coughing is to place upon the chest hot cloths, followed by cold ones, then hot, then cold, so alternating many times. This reëstablishes natural circulation and restored circulation means relief from cold.

CHAPTER XIV

HOW TO IMPROVE YOUR FIGURE

Frankly determine how far your figure falls short of perfection. Perfection, that is, according to the canons of classic statuary. The standards of the Greek sculptors have never been improved. These are their undeviating rules:

The figure should be exactly six times as long as the foot. The face from the middle point of the hair line to the point of the chin should be one-tenth of the entire stature. The hand from the tip of the middle finger to the end of the palm should be of the same length as the face, and so also one-tenth of the length of the body. From the highest point of the forehead to the beginning of the chest should be one-seventh of the length of the body.

If the face from the hair line to the point of the chin is divided into three parts the first line of division is the point equidistant from the lowest points of the eyebrows. The second division line is that directly beneath the nostrils.

The body when standing with the arms extended horizontally should form a human Maltese cross. The length of the body should be the same as the distance across the body from the middle finger of one hand to the middle finger of the other.

The ideal face of the sculptors has always been pear-shaped, diminishing from a noble width at the forehead and top of the head to a slim delicacy of chin. The trend of feature formation in this age of personal dominance is in another direction, toward a widening and increasing of the weight of the jaw. This adds to the impression of strength of character, but it subtracts much from the sum of the beauty of a face.

I have referred to the face because I wish to apply it as a determining factor in judging the beauty of the figure. The sculptor’s test of the beauty of a face is its profile. If the profile is strong and beautiful, the face is equally strong and beautiful. In other words, the beauty of a face cannot exceed that of its profile. So the determining view of a figure as to its beauties or its defects is the profile view. The woman who would improve her figure should study it critically from the side. For this reason, the woman who sells her easy chair and buys a duplex or triple mirror is an economist of her own beauty.

Determine in what respect your figure varies from the canons of beauty, and try to conform to them. Are you a little too short for the breadth of your figure? Stretching exercises should add somewhat to your height. Stand before the open window, and with hands back to back, the finger tips touching, rise upon your toes and stretch to your greatest height.

So the woman who would be taller should recline a great deal, take as much sleep as possible. Physiologists have proven that the body is considerably taller in the morning than in the evening. This is because the muscles and joints have relaxed, while during the varied exercises of the day they have contracted. The mass of muscles have much in common with india rubber--they have elastic properties.

The critical view in the duplex or triple mirror may reveal that the figure is too broad or too thick for its height. If too broad the defect is serious, and will be difficult, if not impossible, of remedy. If too thick, diet, exercise or massage, or all of these, may be summoned. Breadth reveals the framework of the body, indicating usually that it is too massive. You cannot change the framework of a bridge, nor yet of the human body. The modification must take place in that which covers it, the layers of muscles and fat. The figure that is too thick, that is from front to back of waist, or from the middle of the spinal column to the point of the bust, may be materially improved.

For this improvement I would look first to the back--I always notice instantly whether the back be straight and flat or round and full. For in that difference lies much of the elegance or lack of it in a female figure. If the back is full and the hips bulge, the waist is large the figure has no elegance; is, indeed, common. If you are the possessor of such blemishes to beauty you should at once set at work to remove the defects.

First give attention to your diet. Eat much less than usual. Say reduce your diet at the beginning by one-quarter, then one-third, and after that one-half. The slimming results will soon become apparent.

But do not be satisfied with one means of securing a flatter back and slender hips. Exercise, especially in the open air. Walk, walk, walk, beginning with a short walk if you are unaccustomed to walking, and increasing the distance each day.

And if possible have recourse to massage. I have before said in this series of articles that I consider massage the first aid to beauty. It has always seemed to me a cure-all for defects in beauty. It improves the complexion, improves the figure, brightens the expression and makes more beautiful the eyes. Therefore, to give the flat back and narrow hips that are part of an elegant figure, I advise deep massage, with an astringent liquid preparation.

Some adventurous women have taken internal remedies under the advice of their physician, which is the only safe way to take any internal obesity medicine. I have never advised reduction remedies to be so taken. By absorption, however, I consider this to be a good remedy for over-development:

Oil of sweet almonds, 4 ounces; tincture of benzoin, 1 dram; extract of Portugal, 4 ounces; oil of neroli, 20 drops.

This, too, is a good astringent lotion:

Tincture of iodine, 30 minims; iodide of potassium, 60 grams; distilled water, 10 ounces; aniseed water, 170 minims.

Also this:

Tincture of iodine, 1 ounce; alcohol, 10 ounces.

If, on the other hand, the critical side view reveals not only the back and sides as too thin, but the entire outline as too meager, then this cream, freely applied by light and frequent massage, is an aid in curve-making and flesh-building:

Fresh mutton tallow, 6 ounces; lanolin, 6 ounces; spermaceti, ½ ounce; cocoanut oil, 4 ounces.

This, too, is a good tissue-feeding cream:

Lanolin, 60 grams; oil of sweet almonds, 40 grams; tannin, 1 gram.

Women who think their busts are too large write me often asking how they may reduce them. Personally, I do not approve of any treatment, except a general dietary and general exercise, such as tends to reduce all portions of the body. In view of the many requests I receive from determined women begging such a recipe, I give this European formula, but I protest against any woman using it unless with the sanction of her physician:

Oil of sweet almonds, 100 grams; white wax, 50 grams; tincture of benzoin, 25 grams; rosewater, 25 grams; tannin, 15 grams.

After exercise and diet for improving the figure, there is nothing so important as to be well corseted. If possible have your corsets made to order. Pay less for a gown if necessary to order a better corset. Get one that is pliable and hygienic and yet molds the figure into its best lines. To fit well the hips should be the first consideration. The rest of the body can take very good care of itself. Yet the corset should not be too tight about the hips nor abdomen. For this reason I always advise that there be rubber webbing in the sides of the corset.

Every corset should have eight elastics. Yes, I mean it--four on each side. These elastics not only hold the hose in well, but they hold in the abdomen and hips. The first pair of elastics should be fastened directly in front, on either side of the steel fronts of the corset. The next pair should be about an inch, or on a very stout woman two inches, to the right and left respectively. The third pair should be directly over the hips. The fourth should be at the back. While at first this maze of garters seems a hopeless tangle, one soon acquires the knack of fastening them. They add much to the trigness and tautness that contribute elegance to the figure.

The fourth desideratum is a good carriage. Keep the shoulders and abdomen back. Keep the bust and the chin up. Swing the hips well forward when you walk. Observe all women who are stout, that is, heavily stout. There is a distinction. Women may be stout and yet carry their bodies as though they were weightless. Others of no greater bulk walk as though they were weighted down with invisible handicaps.

The heavily stout woman walks with her hips back. In this faulty carriage lies much of her awkwardness and apparent weight. Walk on the balls of your feet, lightly. This becomes a habit that renders a woman graceful and almost without apparent weight.

For the consolation of women who have shapely figures, though built upon an ample scale, let me quote this dictum of an authority on womanly beauty: “It isn’t the size, but the shape that counts. Proportion is the thing.”

Some women are really tall enough, but they look dumpy. The thing for them to do at once is to reduce their weight. “If you reduce your hips you will look taller” is an axiom of the beauty culturists. So set about it. If you are short and thin, then hasten to broaden your shoulders, expand and inflate your lungs; draw back your elbows and breathe deeply. Fill out your bust and chest. This will actually make you taller and appear more so.

Short girls generally carry themselves badly. Keep your head thrown back and your chin out. The woman who keeps her chin down in her neck always looks shorter than she is. Take physical culture lessons, all you short girls who would be tall; learn to walk gracefully, and train your muscles into suppleness. Take walks in the open air with a light, buoyant step, your shoulders thrown back, breathing deeply through your nose. And stretch yourself, every moment of the day when you can.

Three inches, real or apparent, may be added to a woman’s stature by a little common sense.

The short girl who would be tall should go in systematically for stretching exercises. Lie down flat and stretch out your arms as far as possible above your head. Also practice neck movements--keep on stretching your neck out just like a goose, to elongate it. Stretch your legs out taut and keep stretching yourself on tiptoe. Hold up your chin and your abdomen, and stretch continually. Here are some excellent stretching exercises to make you supple and straight--and taller:

Lie flat on your back on a hard mattress. Plant palms downward straight at the sides, but do not grip the ticking with them. Now draw the legs up slowly, bending at the knees, and holding the knees in the air and heels close to the body. Now, with a quick, sudden movement, thrust the legs out straight and flat on the bed, the toes stretched as far as possible and pointing down. This brings into play every muscle from the knee to the tip of the toes and sets the limbs tingling. Draw up slowly, counting seven and inhaling; hold position through seven counts, and again thrust down, exhaling through the mouth. Rest four counts and repeat.

Lie flat on the back, heels and balls of the feet together, arms at sides, palms down. Breathe slowly seven times. Now, with the shoulders or upper part of the trunk rigidly flat on the bed, raise the middle of the trunk, generally known as the waist line, by the muscles of the hips. Inhale as you lift, counting seven; exhale as you fall. Next inhale deeply and lift the lower part of the trunk and let it fall in quick succession, repeating the movement perhaps five times while inhaling once.

Reverse the exercise described above; that is, let the lower part of the trunk rest on the bed and lift from the waist line up by means of the muscles of the shoulder blades. Use the same methods of counting, inhaling while counting seven; hold the position, then lower the trunk, counting seven, and exhaling. Then work rapidly, with five quick uplifts to each breath.

It is well to scan your figure occasionally in the mirror--to satisfactorily do this you need a full length mirror--and decide what are its flaws and how to rid yourself of them.

Perhaps you have a disfiguring stoop. Rid yourself of this, if necessary, by wearing shoulder braces. You can buy strong, reliable ones at most drug stores, and you can make them for yourself with two strong stitched bands of muslin to which cross pieces are attached. Fasten these to your corsets by safety pins. Perhaps that apparent stoop is due not to actual bending of the shoulders but to a roll of superfluous fat that accumulates just below the neck on women who have attained thirty years, or even before. Remove this unsightly blemish by several methods. First, throw away your pillow and lie with head and feet on a level. Form the habit of standing very erect. Stretch your arms sideways and on a level with your shoulders and twirl them rapidly backward.

There are always several preparations which can be used to advantage if applied outwardly. Bathe the shoulders every night with this, rubbing it thoroughly into the shoulders:

Iodide of potassium, 1 ounce; alcohol, 12 ounces.

If your limbs are too heavy, as is liable to be the case in America, where women’s figures are not so well proportioned as in many other countries, the lower part of the body being disposed to stoutness, walk much. This will reduce the bulk of the fat and make the muscles solid. Occasionally I receive letters asking me to tell a girl how to make the limbs larger and more shapely. Massage with olive oil should enlarge them. To inquiries as to how to make the thin ankles plumper I make the same reply.

No figure is attractive if the hips are out of proportion to the rest of the body. They should be neither too large nor too small, but in perfect accord with the rest of the figure. If the rest of the figure is thin and the hips plump the effect is ludicrous. If the body is ample and the hips flat the hips are incongruous. Fashion may dictate broad hips one season and narrow hips the next, but their ideal size remains the same. They must look as though they belong to that body and no other.

They should be amphora shaped, as any sculptor will tell you. An amphora, you know, is a large Roman vase with lines exquisitely curved downward. Study the pictures of statues of the ancient Greeks and you will comprehend the beauty of the hip line in the natural figure. They are neither over heavy nor too thin.

The bones should be well covered, but there should be no fat creases and no loose hanging skin. If there is too little flesh applications of olive oil will increase it. But the fault in the American woman's figure is that she is unduly developed about the hips. For this figure blemish it would be absurd to bant, for her whole body would diminish under it and the hips remain proportionately as large as before. Massage and exercise are the hope of the woman of overdeveloped hips. Rub briskly and firmly, with a strong slapping motion, this mixture, prepared especially for each application.

Unsweetened butter, 1 tablespoonful; tincture of iodine, 20 drops.

Long corsets that are not too tight keep up a continual gentle friction that helps to some extent in reducing the hips, but these should never be worn so tight as to compress the inner organs nor constrict the muscles. Better too redundant hips than an interference with the circulation, which may cause varicose veins or other serious complications.

These exercises are simple, but will be found exceedingly helpful if persevered in, in diminishing the hips:

First, stand perfectly erect; the knees should not be bent. The heels should be held together. The palms of the hands should rest firmly upon the hips.

Second, swing the right leg slowly and firmly sidewise, raising the foot as high as you can. This should not be suddenly or violently done. Rest the weight of the body firmly on the left foot while so doing. Kick thus slowly a half dozen times or more, until the muscles begin to be weary. Then shift the weight to the right foot and kick in the same fashion with the left.

Third, stand with the weight on one foot and raise the other leg slowly, until it is on a level with the trunk. Lower the foot and repeat this exercise many times until you begin to grow weary. Then change the weight to that foot and repeat the exercise with the other leg.

Fourth, stand as I at first described, the body straight, the chest and head high, the heels together. Raise the hands sidewise above the head, bringing the tips of the fingers together. Then, in the posture that swimmers take before they dive, bend slowly forward, keeping the knees straight, until the finger tips reach the ground. Repeat this until fatigue warns you to stop. Never exercise until weary.

But even a perfect figure avails little unless you have grace. When I am asked how to be graceful, I answer: "Be careful of your movements when alone and unconscious of them when you are in public." Grace can be cultivated. There is no excuse for a woman who is not deformed being awkward. There are degrees in grace, but every woman may possess it to some extent.

To the woman who wishes to enhance her natural grace, or who, having none, desires to add it to her charms, I advise first of all the study of great paintings and statuary that are models of line and poise. Line is important, but I have seen women who were all straight lines, to whom nature had given not one gracious curve, who were nevertheless graceful. The long, flowing lines of grace may be assisted by careful dressing, and this a dressmaker may do for us, but poise, which is a much bigger and better word than pose, including pose and much more, comes from within and may be self taught.

I wish that every woman who reads this chapter would pay a visit to the nearest art gallery and study, if there be one, a good copy of the wonderful Venus de Milo. Let her study it until something of the inward strength which gives it its wonderful balance and power and perfect symmetry is revealed to her.

One of the secrets of that marvelous statue is the calm soul it expresses. Again and again I have said that serenity is the chief secret of beauty, and I point to the Venus de Milo in proof of my assertion. The nervous, distraught, ill-centered woman reveals her soul state by nervous, abrupt awkward movements.

Compose yourself inwardly and see with what grace and strength you stand before your mirror. Permit some emotion to disturb you, and note the ravaging, unlovely effect. Grace is poise, and poise means a calm soul center.

For a graceful carriage we must consider how to stand, how to walk and how to sit. The late Heinrich Conried, being asked to describe a beautiful woman, said: "That is simple. She is harmonious." What he meant was that she was harmonious within and harmonious without, the inward harmony revealing itself in the outer. There was no discord in her. To stand in a drawing room as

you would stand on the ledge of a mountain would be inharmonious. To sit on a high-backed chair with straight lines, as you would sit upon an ottoman, or a tête-à-tête would be strikingly discordant. To walk into a ballroom as you would set forth for a walk along the beach would be ludicrous. There must be in every movement harmony with your surroundings, and you must yourself be governed by the immediate circumstances.

Lola Montez, the enchanting dancer and the dancing enchantress, well knew the value of a graceful carriage and of the cheerful spirit of which it is an expression. She said: “A crushed, sad, or moping spirit, especially if allowed at a tender age, when the body is forming, is a fatal cause of a flabby and moping body. A bent and stooping form is quite sure to come of a bent and stooping spirit. If you would stand well, sit well, walk well, lie well, ‘sway gracefully on the poised waist’ as upon a pivot.”

Given a straight healthy spine, straight, strong bones and the serene spirit of which I have spoken, and there remains for grace two necessities, knowledge and training. One must know how to hold the body correctly before she can so hold it.

The correct position, one in which the balance of all parts of the body is perfectly preserved, is almost, but not quite, erect. It should incline very slightly forward, above the hips. The weight of the body should rest firmly upon the balls of the feet. The heels should be close together. The knees should also be close neighbors. The arms in standing should hang naturally at the sides with the elbows close to the sides.

One position only is proper for the chin. It should be well up. Notice any woman whose chin is lowered. Shadows fall about the hollows of the face, or create an illusion of hollows there. Every woman looks five years older with her chin lowered. Also such a pose of the head will make wrinkles in the fairest and plumpest neck. Nature designed woman to hold her head as proudly as that of a mettlesome horse. The chest should be held up and out.

Observe how a well-trained soldier stands on parade. That is an excellent model. He appears to have no abdomen, so well is it held in. His shoulder blades are flat as a knife.

If the shoulder blades are not naturally flat, shoulder braces should be worn to correct the projecting ones and to destroy the round-shouldered effect so destructive of the beauty of a figure. These can be purchased at drug stores and department stores, but can be made at home at slight cost. Stitch two long strips of coutil two and a half inches wide in many parallel rows to make it strong. Fasten these at the back just over the shoulders with another horizontal stitched band of the same width. A simple exercise for sagging shoulders is to draw the arms behind you, bend them at the elbows and thrust a cane between the elbows and back.

Practice the proper posture in standing before the mirror. Study not only the front, but the profile view of your figure. If the chest sags, thrust it forward. If the abdomen protrudes, determinedly shift your weight so that it recedes. The prominent abdomen in half the cases I know is simply the result of bad habits of standing. If the shoulders curve forward, draw yourself erect until they are flat.

If you find your weight resting upon the heels, your figure will look awkward and countrified. If you rest upon the toes, it will look mincing and affected. Nature has indicated that to keep the balance of the body the weight must fall upon the balls of the feet. Try all these postures and notice how much better your figure looks when you stand correctly. It will be an object lesson you cannot forget.

Five minutes a day for two weeks ought to teach the dullest of us to stand well. After that the lesson of gracefully shifting the weight when you are tired may be practiced. Move one foot slightly forward, dividing the weight equally between the two. Then rest the full weight of the body on one foot. Then, by a quick, slight shift, change it to the other. But return quickly to the position of an equal division of weight. For when the body rests upon one foot the hip and shoulders of the other side will be raised.

A good walk is a thing of beauty. A bad walk is a pain to the beholder. A bird balancing lightly on the end of a twig is the best model I have ever seen for walking. He seems weightless. He vibrates with the joy of motion. The best walkers in the world are Spanish women. They move with a slight undulation that is exquisite. Their limbs move as though they have no weight. One of your clever American women describing the good walk said: “Move as though you lived altogether in the upper story.” “The upper story” was that part of the body above the waist. The remainder she classed as “the lower story.” It was an admirable hint. The upper half of the body should be evident in the walk. The lower should be merely a means to the end of walking.

The walk should invite attention only to the fine poise of the head, the perfect carriage of the chest, the straightness of the back. The limbs should be forgotten. A walk which attracts attention to them is always an awkward walk. The upper part of the body should be as free as though it turned itself upon a pivot. The lower part should be regarded and utilized merely as a pedestal for

holding the upper. In walking as in standing the weight should rest upon the ball of the feet. The toes should be turned slightly outward. The knee joints should move easily and the movement of the whole of the lower part of the body should be a stately and apparently unconscious motion.

Some women there are who stand well and walk well, who sit badly. Indeed, they do not sit. They lounge. The same law of balance should hold in all. That is, the weight should be evenly distributed, no portion of the body having to bear the lion's share of the burden. As a rule, the comfortable attitude is the correct one in sitting, though this is not true of the lazy person who sits with chin lowered upon breast and abdomen thrust forward, as a caricature of the human form. Sit with the feet resting upon the floor or upon a footstool. Never let them swing without support. Sit straight, or rest against a straight-backed chair, with the lower part of the body pushed close against the chairback. This is a much better way to rest than the half-lying, half-sitting posture that is so ungraceful.

In standing, don't throw the hips far back. They should be straight, in easy line with the body. In walking, do not swing the arms. In sitting, keep the crown of the head up and back.

To test your carriage, pass the hand across the back. If the ends of the shoulder blades can be felt at a light touch of the fingers, the carriage is incorrect. The shoulders must be drawn farther back.

CHAPTER XV

SAFE, EASY WAYS OF REDUCING WEIGHT

In this chapter I shall try to answer that which I call "The Great American Question." In other countries where I have lived and visited, women ask, "What shall I do to remain young?" In America women have by their intelligence solved that problem. Here the torturing, ever recurring question is, "What shall I do to be thin?"

Fat is the greatest foe to American beauty. But it is a self-created foe. American women, learned in all other matters of personal hygiene, ignore that which is chief, the hygiene of the table.

I will not say that American women overeat. They eat the wrong things. In food they deal in extremes, which are always detrimental, whether to beauty or to morals. They eat what is very sweet, or very sour. They eat what is very cold or very hot. They eat foods that are too highly spiced, or underdone. Extremes, always extremes! And when they have had too much of this extreme food, and the tortured stomach revolts, they go to another extreme, and fast, which is, in my opinion, a most pernicious extreme.

One fact that the stout woman should keep ever before her mind, as a signal light before a ship battling its way to port, is that fresh air is a destructive agent to fat. Oxygen burns carbon. To make this clear, let me ask you if you have noticed how a dying fire flames up when a draught of cold air is turned upon it? That is precisely what happens when a woman who is too fat goes out for a walk. Carbon, which is in the great folds of flesh that lie upon her abdomen and blanket her hips, is also a component part of the coat. Oxygen acts upon this as a burning match applied to paper. Therefore, if you are stout, walk, walk, walk.

This will not be easy. It will be hard indeed. For the woman who is too fat is invariably ease and luxury loving and a long walk is to her at first a hardship. But she should be in this as in all things else discreet. Her first walk should be a short one. If she be one of those women who always take a street car or a carriage, her first walk should be only eight or ten blocks long. I am computing by short New York City blocks. Twenty of these are equal to one mile. I have seen a woman unaccustomed to walking come puffily into a room, drop into a chair exhausted and say: "I am tired to death. I've walked eight blocks."

But this woman persisted, or, rather, her friends persisted. They insisted that after a few hours she take another walk. To their pleasure she achieved this time ten blocks. In a walk the evening of the same day she covered twelve, and came in with a pink glow in her cheeks and a new light in her eyes. By the end of the week she could walk one mile each morning without discomfort. The second week she increased this to one and a half miles. The third week it became two and when the second month of her exercise began she walked three miles every morning and came home with heightened color, a diminished waist and no complaints.

After two months her morning walk of five miles, regardless of weather, had become a necessity of her health and spirits. It was amazing how, as her girth decreased, her beauty increased. The cheeks that had been heavy and flabby grew firm and rosy. At first, though there was a perceptible decrease in her bulk, there was little difference in her weight. Her waist measure decreased one and a half inches and her hip measure two inches, yet she was but five pounds lighter. This apparent riddle is, after all, easily

guessed. Fat is of spongelike texture and light weight. Much of it may disappear with little corresponding reduction in weight. If a woman sees that her belts have become too large and that she needs a dressmaker or tailor to take in her gowns about the hips it does not matter whether she has lost five or twenty pounds. She has accomplished that which she resolved to do. She has grown beautifully less.

I have known women who never walked more than a few blocks at a time accomplish a ten-mile walk in a morning. The wisdom of this I always questioned. Walking is of no permanent value unless it is regularly done. Better three miles every morning than ten miles twice a week. Besides an exceedingly long walk is a severe tax upon muscles unused to walking. The muscles must be treated gently as little children. They should be slowly accustomed to their task.

Riding is an excellent reducing agent. A morning gallop in the park or along country roads will soon diminish ponderous flesh. Golfing is excellent. Swimming is admirable. Driving, because the body is entirely passive, is of little use. Indoor exercise in a gymnasium is better, much better, than nothing, but outdoor exercise distances it by one hundred per cent. Although the windows of the room be opened wide the room does not provide half the oxygen yielded by the great out-of-doors.

After the burning aid of fresh air, in importance comes diet. The stout woman should try reducing the quantity of her food one-third, then one-half. She should eliminate from it these dishes:

Pork, veal, beans, peas, fat beef or mutton, cauliflower, potatoes, milk containing cream, puddings, pies, candy, sugar, white bread, eels, salmon, chocolate, beets, butter, red wine, ice cream.

She should substitute for them:

Lean meats, eggs, green vegetables (as spinach, string beans, asparagus, beet tops), oranges, whole wheat, graham or gluten bread, white bread, toasted thin and crisp, saccharine instead of sugar, fresh or dried fruits.

A famous woman rid herself of ten superfluous pounds in a month by a modification of the milk diet. She drank two quarts of skimmed milk a day, and ate but one meal. She dined at seven with her family. Her breakfast and luncheon, consisted of two glasses of skimmed milk. She sipped the milk, giving herself five minutes for each glass, for she knew milk was rather a food than a beverage, and that since it passed speedily into the consistency of cheese in the stomach it must be slowly swallowed. The remainder of the two quarts of her daily stint she sipped whenever hunger gnawed and she was tempted to return to her old diet of what in America you call “three squares” a day.

Several of my friends have reduced their weight by the expedient of taking a long walk, as long as their strength would permit, before breakfast, but the nearly uncontrollable appetite for the deferred meal created by this exercise is a discouraging element. Others have been successful in reducing flesh by foregoing their breakfast altogether. Many dieticians agree that breakfast is “the fattening meal.” And there is reason to believe the stomach needs breakfast less than any other meal, since there has been no special outlay of strength during the night of rest as during the day of activity.

The fashionable woman used to think that she should rest immediately after a meal. Now she walks slowly, or at least stands for twenty minutes after each meal, being convinced that if she sits or lies down after a meal her abdomen will become distended, one of the most unsightly forms of superfluous flesh.

Massage and baths are an undoubted aid in the reduction of flesh. Massage should not be made to take the place of exercise. It should supplement it. It is estimated that thorough massage given by a skillful operator is equivalent to a seven-mile walk. But if this be true so far as the physical effort is concerned, there is no substitute for the carbon destroying bath of oxygen.

No room can be so well ventilated as to approach the purity of the outer air. The woman who is taking massage to reduce her flesh should not rest afterward. The massage should be followed by a dip into a bathtub of tepid water, a scrub and a salt rub, a cool spray and dressing, calisthenics or a walk.

Do not allow your masseuse to use oil or cold cream. Talcum powder is best for the woman who wants to be thin.

Reduction medicines I do not advise. Certainly I should never use one of them internally without consulting a physician, and having the compound analyzed. There are drastic remedies that reduce the flesh and demoralize the digestive apparatus. Far better in this instance the ill than the remedy and its consequent evils.

Some preparations of an absorbent nature I have known to be used with good results. Most of these contain iodine. There are several soaps used for the purpose of massage, all containing iodine. After receiving my physician's endorsement and having the soap analyzed by a scrupulous chemist there would seem to be no danger attending their use.

This formula is safe, and if persistently used, should be effective as an absorbent remedy. I have known corpulent beauties who took it internally, but I should never be so daring:

Tincture of iodine, 30 minims; iodide of potassium, 60 grains; hyposulphite soda, 20 grains; distilled water, 7 ounces; aniseed water, 170 minims.

I have before recommended Turkish baths for flesh reduction. That advice I must qualify by explaining how they should be taken, for there are thin women who take Turkish baths to fatten them, and with success.

As a reducing agent the Turkish bath should be taken in a more radical way than for mere cleansing and tonic action. The bather should remain in the room as long as possible, that is until she is warned by faintness or a fluttering of the heart that she has been in the abnormal temperature long enough. These warnings she must instantly heed. The length of time is governed by her temperament and health. It may be twenty minutes, but it should be from half to three-quarters of an hour. After the scrub and massage that follow she should go instantly to a couch and be wrapped in many blankets, so that the flow of perspiration will continue. Thus while she is resting she should perspire for another half hour. This makes a drainage at the pores for between one and two hours and reduces materially the weight. But I do not advise Turkish baths oftener than twice a week at most. Taken oftener I believe them to be weakening.

A cool or cold plunge every morning is prescribed by some beauty experts. Personally I am opposed to them. They are not cleansing. The delicate person cannot withstand them. They are a tonic to the robust constitution, that does not require them.

A gentle laxative is a great aid in reducing. Various salts, with the consent of your physician and taken in a manner he advises, would be helpful in diminishing flesh. But I insist that whatever is done in this direction must have a physician's approval. I will not unqualifiedly recommend it. The tendency of salts is to render a person who takes them anæmic. Should the person who wishes to reduce be already anæmic the effect of the salts, in thinning the blood, might be injurious.

To summarize my advice upon the matter of reducing flesh, let me say that the simplest methods are the best.

Make oxygen your first aid. Spend at least two hours a day out of doors. The more active the outdoor exercise the better, stopping this side the point of exhaustion.

Reduce the amount of food one-half, and change the dietary from the fat producing foods to bone and muscle makers.

And, in conclusion, a warning. As the muscles, divested of blanketing flesh, seem to shrink, be sure that the skin follows them, instead of hanging baggily about them, in ugly wrinkles or creases.

To contract the skin that surrounds the diminished muscles bathe it frequently in cold water. Bathe with a sponge dipped in cold water, or wrap the parts about with cold compresses.

If this method, which is called "freezing the muscles," is not successful this astringent cream applied every morning and evening should be:

Glycerine, 5 ounces; mutton tallow, 1 pound; tincture of benzoin, 2 drams; spirits of camphor, 1 dram; powdered alum, ½ dram; orange flower water, 2 ounces; Russian isinglass, 1 dram.

One day not long ago a charming young woman came to see me. Her face indicated deep distress.

"You are looking charming," I assured her.

"No, no, madam," she returned. "I am looking wretched, dreadful. I am positively ashamed of myself."

"But why?" I asked.

"Don't you see? I am over weight. I am twenty-seven. My height is five feet three inches. I weigh one hundred and sixty-five pounds."

“Your curves are a bit ample,” I admitted.

“You know very well, dear madam, that I am like a pillow of feathers. I lived at a summer hotel where they had really good food, and behold me. I can hardly believe that I gained thirty pounds in six weeks. What shall I do?”

“First understand that you cannot lose the flesh much faster than you gained it. You will need at least a month to lose the thirty pounds.”

“But I must lose them, madam. Think of appearing in the opera like this? Think of dancing, not only with a man, but with thirty extra pounds. What shall I do?”

I repeated the litany of reduction: “Exercise, diet, abstinence, perspiration.”

“But how?”

“Exercise until you are tired, and then don’t rest but exercise some more. Rest from one kind of exercise by trying another.”

“What exercise?” persisted my too plump friend.

“First a series of exercises that force you to breathe deeply. Begin as soon as you rise in the morning, and, by the way, rise at least an hour earlier than usual. You fatten as much by too much sleep as from too much food. In your night robe, or if you prefer it, in a bathing or gymnasium suit, go to the window, fling it wide open, and standing with the arms raised above your head, palms outward, elbows straight, inhale deeply and slowly, counting eight. Hold the air while you count eight. This gives the air a chance to sweep through the air cells of the lungs, bathing them with its freshness. Then expel the air slowly while you count eight. Repeat this until a slight dizziness warns you that you have done enough.

“Then begin the bending exercises. With fingers extended bend slowly until the finger tips reach the floor. Then rise slowly, and raise the arms above the head. Do not raise the shoulders, but slowly bring the tips of the fingers together above the head. Then gradually bend forward until the tips of the fingers reach the floor. Then back and up again.

“This exercise is difficult, especially for the stout. But persist in it and it will reduce the overfatness of the abdomen.

“You will be tired by this time, but you must not encourage the feeling of drowsiness and torpor and disinclination for further effort that creeps over you. Banish all thoughts of going back to bed. Instead begin your rolling.

“There is no mystery about rolling. It is simply what the name indicates. Down upon the floor you go and roll over and over swiftly, not slowly as a porpoise rolls. The porpoise, you will observe, is not a slender animal. Roll over as a puppy, tingling with the joy of life, rolls in the dust when at play. Roll quickly. Make at least eighty revolutions before stopping. Now you are very tired. The unaccustomed perspiration appears upon your face and body in drops. That is good. To reduce weight you must perspire. Most fat people have lost the art of perspiring.

“But you have not finished your exercise. Don’t think of breakfast. Don’t think of a nap after your strenuous half hour. Get a skipping rope and go out on the roof, on the fire escape, or into a vacant room and jump the rope twenty-five times. This the first morning. The second morning make it fifty and continue increasing the number until a flutter at your heart hints that you have taken enough of this exercise for the present.

“Then try some new dance steps. If you have done these thoroughly you will have spent an hour and a quarter at reduction. Go then to your bathroom and take a shower, first warm, then cool, then gradually becoming cold. With a big Turkish towel rub yourself thoroughly dry. Come back in a week and tell me how much you weigh.”

“One hundred sixty-one,” she said. “But that is not enough.”

“It is not,” I answered. “We must do better. This week, after you have finished your exercises indoors, you must dress at once and go for a long walk or ride.”

“But breakfast?” she asked faintly.

“It would be better if you ate no breakfast,” I answered sternly. “Or, if you take any, let it be a glassful or, if your stomach is clamorous, two glassfuls of buttermilk. Drink them slowly, taking at least five minutes for each glass.

“When you return from the walk or ride take another shower.”

“And rest?”

“There is no rest for the person who is reducing. It is an occupation in itself. After your luncheon, which should be of lean meat or fish, toast and coffee without cream or sugar and stewed or fresh fruit, go out again. Go shopping or calling. If calling, decline tea and sweetmeats that may be offered you. If shopping or calling don’t drive to your destination. Walk. For dinner you should have the same as at luncheon, with the addition, if you wish, of a small glass of white wine. White wine, being sour, is one of the agents for reducing flesh that all French dietitians prescribe. After dinner more exercise in the open. Driving is better than staying indoors, but walking is better. I have before pointed out that in walking you take in four times as much fresh air in a given time as you do in driving. And fresh air in the body is like a draught of air in a furnace, fanning a blaze that consumes all refuse and slag. Go back now,” I said, “and call again next week.”

Next week her step was lighter. Her eyes were brighter. She said: “You are a hard taskmistress, but I have done as you advised. My weight is now 154 pounds.”

“You have lost a pound a day,” I said. “That is enough. Some authorities would say it is too much. Now we will vary the treatment a little. I have told you about exercise and diet. Now as to abstinence.”

“It is dreadfully hard to do without sweets,” she sighed.

“Did you do without them?”

“Not wholly,” she admitted.

“If the hunger for sweets seizes you let fruit tablets dissolve in your mouth and swallow them slowly. This will satisfy for a time the craving for sweets that is as tormenting in its way as the craving for drink, and as hard to cure. The fruit tablets are a make-believe candy, and yet are so largely fruit and water that the sugar in them is hardly a calculable quantity.”

“But I am hungry nearly all the time; hungry for other than sweets. Hungry for substantials.”

“If you insist upon eating as much as you wish I can do nothing for you. You must leave the table with your appetite unappeased.

“Drink a great deal of water. That refreshes the body, but helps to destroy the appetite for food. Normally, you should drink ten glasses a day. Increase the amount to twelve or fourteen. With your buttermilk for breakfast, your lean meat, dry toast and coffee at luncheon and the same with white wine at night, your stomach will be satisfied.

“But do your water drinking discreetly. Begin in the morning as soon as you rise by sipping two glassfuls. Finish the day by the same quantity. The other should be drunk between meals or, at most, one glass should be drunk a day.

“Keep before your mind the word ‘Abstain.’ Remember that you must abstain from sweets, from pastries, from milk, from cauliflower, potatoes, lima beans, corn, all the vegetables and cereals that fatten.”

At the end of the third week she came back perceptibly lessened. “Eight pounds less this week,” she said triumphantly. “My weight is now one hundred and forty-six. Only eleven pounds of the thirty remain.”

“Do you perspire well?”

“Better than I did. But not freely.”

“Then the pores must be educated. Some pores must go to school to learn their function. When all else fails a course of Turkish or Russian baths will do this. Take them at home in a cabinet, or at public baths, as you prefer. I prefer the Russian baths because they are moist and they do not force the lungs to breathe hot air. The cabinet baths permit an opening for the head so that while the body is perspiring the lungs may be inhaling cool, pure air.

“Take one of these baths every morning. Keeping the feet in hot water facilitates the perspiration. At the end of a week you will find that the pores will have learned their office and perspiring will have become easy. While you are taking the course of baths you may relax somewhat from the exercise. Or you may take instead deep or kneading massage, the sort in which your masseuse’s knuckles seem to reach the bones.”

At the end of the week my patient wrote me: “I cannot call to-day, but rejoice with me. I have lost eight pounds this week. Only three more to spare. I am keeping tailors and dressmakers busy taking in my frocks.”

Three days later she appeared, looking radiant. It was as though a half dozen blankets that hid her beauty had been removed. Her charms had been hidden by too much flesh, as the flame of a lamp is obscured by a soiled chimney.

“One thing I forget,” I said, anxiously scrutinizing her face for sagging skin. “But you do not need the warning.”

“No, I had a facial massage every day to keep the skin of my face firm.”

“And there is no sign of a pendulous chin,” I said, admiringly.

“I kept the chin firm by freezing the muscles into hardness with cold water compresses and applications of ice.”

Here is how another young friend of mine lost nineteen pounds in five weeks without injury to her health.

Before she fairly realized that she was putting on flesh she found herself with all the symptoms of overweight. Her face was full and puffy. Her cheek muscles sagged, giving her face the jowl-like look that suggests the lower animals, transforming beauty’s face into a beastlike semblance, and that beast not the handsomest, nor most poetic, of the order. As she surveyed her figure in the mirror, particularly in the back, it looked broad and coarse. Moreover, she was conscious of her weight. Her movements had become clumsy. When we are at normal weight, that is, when we are only so heavy as nature intended, and nature abhors overfleshed women, we are not oppressed by our bodies. We feel so light and our minds are so capable of dominating our bodies that we scarcely realize that we have any weight. That birdlike lightness of body is a sure sign that we are at our best.

My friend, having a long social season before her, when she wished to look her best, resolved to train down. But how? She adopted none of the cure-alls prescribed by stout women we meet at Turkish baths. She did what is the wisest course when we are able to adopt it, went straight to her physician and asked his advice.

This was wise because her physician knew her constitution as she knew her alphabet. He knew which way lay peril. She must not take the beef and hot water cure, because she was predisposed to rheumatism, and authorities claimed, and this physician believed, that in beef there is at least seventeen per cent. of uric acid. The body is able to eliminate only a limited amount of the acid and the introduction into it of such excess over that amount would involve some remaining in the system. This should be avoided in cases of what the physicians call “uric acid diathesis.”

Also his patient was nervous, so he must not permit her that starvation system of diet which reduced her nervous force. Not being an especially vigorous woman, he was unwilling to run any risk of impairing her vitality.

Under his guidance, then, she began this regimen:

For breakfast, two slices of thin, dry toast. If her breakfast satisfied her cravings he insisted that the bread be dry. If not, she spread it very thinly with butter. With this she ate one medium-boiled or poached egg and drank one cup of coffee.

Being of those who say, and prove, if you watch them at the first meal of the day, “My breakfast is my best meal,” her physician knew that this light breakfast would at first be a hardship. He therefore urged her to eat very slowly, masticating her food until it turned into a thin liquid in her mouth. “If you do this,” he said, “one-half the food you formerly ate will just as fully satisfy your hunger.” “And that, which I didn’t at all believe at first I found to be quite true,” she said.

The only luncheon permitted her was a slight one of fruit. “Try to get on with one apple or orange,” he said. “If you are suffering from hunger eat two. But masticate, masticate, masticate.”

At night she was allowed to eat anything she chose, except the three fattening “ps”--potatoes, pudding or pie. But again she was charged to take twice as much time as usual for the meal. And at neither of her meals should she drink water. At breakfast and dinner one cup of black coffee was permitted.

For all the days that followed, for five weeks, she had the same breakfast and luncheon, but every other night she had no dinner save a large bowl of bread and milk. The milk contained no cream, but was skimmed.

Meanwhile she, who had always disliked exercise, discarded her carriage and took two walks a day, one in the morning and one in the afternoon. Her physician named no ground to be covered in these walks.

“Walk as long as you enjoy it, but not until you are tired,” he warned her. Her first unaccustomed walks were only three or four short city squares, but after two weeks, when nature had become accustomed to the new regimen, she was able to walk four miles a day, two before and two after noon.

If, as sometimes happened, she returned from her walk faint, she was allowed to drink a cup of hot but very weak tea, and if nature seemed to demand more sustenance, she drank two cups. But from these cream and sugar were sternly prohibited.

The results I have told you. And my friend never looked so lovely and she assures me she has never felt so well. There was no expensive journey nor stay at the baths; no daily massage. The loss of those nineteen pounds cost her only self-denial, the one fee for her physician and the tailor’s charges for taking in all her gowns four inches about the hips and two at the waist.

While ways to grow thin do not especially interest me, I cannot help hearing continually of them. Wherever I go the conversation of the women I meet tends to fat. All are interested because those who are fat wish to be thin, and those who are thin fear they may become fat. All womankind, it would seem, has organized into an army of fat fighters.

To the baths go women who weigh two hundred pounds, and when they return from Carlsbad, from Marienbad and elsewhere I pass them in the Bois without saluting them, because in those six weeks they have lost fifty pounds and are thin beyond recognition. It is marvelous. One of the great physicians who crossed the Atlantic recently to treat a New York society leader for obesity, received $2,000 for his services for two weeks. They will do much and pay greatly to reduce their flesh, these rich, but what of us who are not wealthy?

We can choose and follow some of their methods once we have learned them. This is one method which a friend of mine uses to keep her weight thirty-five pounds below what it formerly was. It is simple, being baths three times a week in hot salt water. Into an ordinary bath tub she empties two pounds of table salt. She pours water into the tub until it is two-thirds full, and remains in the tub for twenty minutes. After this she rubs her body briskly down with alcohol and retires.

Like most methods of quick reduction this may be criticised as temporarily weakening. Therefore while I am acquainting you with this treatment for obesity I do not recommend it to one who must keep her strength at its fullest. A vacation or a time when your tasks, whether they be business or professional or social, are light, would be the best time for this measure for reduction of weight.

From the harem of Constantinople, through an escaped inmate, comes the news that when a member of it becomes so fat that she is a formless sea of flesh, the overlord orders that she have bone-deep massage daily with this lotion:

Iodide of potassium, 2 ounces; camphor water, 2 ounces; alcohol, 2 ounces.

If while this deep massage and the hardship for a woman of the harem of eating no more of the delicious Turkish paste are continuing her face grows haggard and lines appear in it, it is bathed six times a day with:

Witch hazel, 1 ounce; rosewater, 1 ounce.

Specialists are always prepared to hear the complaint: “I don’t eat much.” All their patients tell them this and all of them believe it to be true, but in nearly every case it isn’t. A few admit that they are enormous feeders, but say “It is impossible for me to control my appetite.” A beauty specialist I know laughs at this.

“When you are hungry between the two meals I will permit you to drink water,” he orders. “Hot water or cold as you like, but drink it very slowly, and never take a glass of water unless there is the juice of a lemon in it. If you keep the stomach filled with water you will be less hungry. If you feel a ‘gnawing’ drink more water.”

This is the dietary permitted by an autocrat at one of the great European baths:

No liquor; all fish, except trout and salmon; chicken; beef (in very small and rare portions, preferably raw); eggs; nuts; all acid fruits such as cranberries, cherries, peaches and blackberries; rhubarb; beans; carrots; cabbage; cauliflower; asparagus; squash; tomatoes; onions; lettuce; celery; hominy; brown or rye bread; Dutch cheese.

These and nothing more composed the food. No servant could be bribed for a potato, and all turned round eyes of innocent wonder upon you if you asked for a sweet cake.

Because the change to this diet was so radical the doctor did not insist upon violent exercise, but he kept his reducing patients out of doors and encouraged them, as did the Paris physician, to keep moving.

While you are reducing depend upon a tape measure rather than the scales to determine your loss of weight. Measure your hips and waist and upper arm. Fat is bulk making, but it takes a large amount of it to weigh a pound. A woman, my neighbor at the baths I visited, had lost three inches about the hips and two about the waist, yet had lost only three-quarters of a pound in weight.

If I were ever encumbered by too much flesh I should first give the rice treatment a thorough trial. It is simple and cheap and has the merit of not reducing too rapidly, so that the facial muscles have time to adjust themselves to the new conditions and the skin of the face to also adjust itself, preventing the haggardness and aged look that follow too rapid reduction.

The rice cure can be explained in a paragraph, a short one, even in a line. It consists in an exclusive diet of rice and milk, or rice with a little butter and salt to make it palatable. It is a leisurely, and for that reason healthful, treatment. A young woman of my acquaintance rid herself of two pounds a week by this diet until she had diminished her weight by the desired ten pounds. I have no doubt, had she continued, she could have reduced indefinitely by that scale. She ate three large bowls of rice a day. Each bowl constituted one of her three daily meals. The rice was covered with skim milk. Had she chosen, she could have eaten it with a little butter and salt.

A fad in Ostend and at some of the German cures is to wrap the limbs and other fatty portions in white muslin or linen cloths that have been boiled in vinegar. They are wrapped around the fleshy portions of the body as hot as the cloths can be endured. When they cool they are replaced by others or they are dipped once more into the vinegar. This treatment is continued for at least twenty minutes and some of the faddists employ it three times a day. It has a certain value, for there is no question about the absorptive power of the skin. But its foes are sure that it makes the skin yellow.

In Germany is being attempted a method that would make for health and healthy thinness in America. German physicians advise the establishment in each town of fruit depots. If these depots or rooms were generally established and a man or woman could drop in at one of them for luncheon as easily as he or she now calls at a restaurant where fattening potatoes, puddings, pastry and liquors are served there would be a benefit to the general health.

Summer is the best season for reduction, for three reasons. First, one of the greatest agents for destroying excess flesh is pure air, and one may get all she wishes of it at this season. If circumstances permit you to leave the cities, the country air will aid in diminishing your girth.

A second reason why summer is the best season for reduction of weight is that we need and crave less food in this season, and, besides, the food is of a lighter nature and contains more acid than in winter.

One fashionable Parisienne betook herself to her château last month for her annual rebuilding and for the first three weeks lived exclusively on grapes and slept in an open air chamber on the roof of her country home. She grew clear of skin and lissome as a girl.

A third reason for utilizing summer in your reduction treatment is that it is the season which favors perspiration. And fat flows from our body on the streams of perspiration.

The latest word in the matter of obesity cures is that fat being composed chiefly of water must be squeezed as a sponge is to rid it of the liquid with which it is saturated.

Whenever there is need a supply soon follows. A school of masseuses have adopted this theory of fat and have gone to work heroically to prove their theory. One of these, who has gone to your country from Sweden, gives the new massage for three hours at one treatment. She beats and pounds and squeezes the flesh until it is soft as putty. The results are amazing. I know an actress who in order to play a vampire woman must needs reduce thirty pounds. This she did last summer, becoming slender and straight as a young pine tree, and with no lessening of her vitality or beauty.

In London they are “jumping the fat down.” Once a day, or oftener, the overweight clan jump up and down fifty times.

In Paris the so-called electric blanket has many advocates and friends. The person who desires to reduce her flesh wraps this blanket about her, attaches to its fastenings the electrical power from the lights in her room, and presently she is dripping with perspiration. Completely relaxed as in a Turkish bath, she lies in her own room, on her own bed, and loses undesired ounces and pounds. After twenty minutes or more she springs from her blanket, hurries to her bathroom and turns on the cold spray or shower, or takes a plunge in a tub of cold water. This, done twice a day, has been the secret of the vanishing flesh of many beauties at Ostend, who had the gratification of remaining in fashionable centers and enjoying life, instead of immuring themselves at stupid

baths.

These are effective new methods for general reduction. Often, however, there is need only of reducing certain portions of the body that are too redundant. Many women are annoyed, especially when they wear evening dress, by an unbecoming roll of fat lying between the shoulders. This has been removed by the simple means of patting it briskly with first one hand, then another, afterwards by stroking it, first with one hand, then the other, the strokes being firm and downward ones. It is better, still, to dip the palms in cold water before beginning this manipulation. “Ironing” the flesh roll with a lump of ice is another method successful in several instances of which I have personal knowledge.

If the chin has begun to multiply the ice ironing is useful, especially if the ironing be followed at night by tying up the chin by a muslin or rubber bandage that is fastened about the head.

Sometimes the excess of fat is in the face, giving the countenance a gross look, robbing it of much of its apparent intelligence, and muffling fine features in a blanket of superfluous flesh. Such a face has rid itself of this incubus, and emerged, youthful, rosy and well proportioned, because, as its owner whispered to me, she never retires without first passing a small lump of ice over her face, always with upward strokes. If the touch of the ice is unpleasant, or if there is in your composition a tendency to neuralgia, wrap the ice in a thin layer of absorbent cotton, or in a piece of gauze or cheesecloth.

Individual treatment for overweight can be treated according to individual needs. Study your needs and adapt your knowledge to them. Keep in mind these four principles of flesh reduction. All methods depend upon increased perspiration, lessened quantity or different quality of food, more vigorous exercise or that which reacts upon certain portions of the body, or greater freedom from clogging materials which are wastes of the body. Those bath powders which are advertised as reducing agents usually contain one of the salts which induce the latter results.

CHAPTER XVI

HOW TO GAIN FLESH

Every woman, while not desiring to be fat, wants to possess a figure that is pleasantly rounded. Curves, for women at least, are the lines of beauty. A man who is all straight lines may be handsome, but no woman who is all angles may be beautiful.

The young women, and the older women, too, who ask me, “What shall I do to become pleasingly plump?” are wise. For womanly lines, like a womanly voice, are wholly desirable.

How shall the thin woman become plump? It is a harder problem than that which I tried to solve last week. For a woman who is fat may become comparatively thin by self-denial, but the thin woman who would become plump must overcome many things, heredity, temperament, some of the most salient traits of her character. The thin woman must make herself over inside, so to speak, before she can make herself over outside.

To be pleasingly plump means that every angle is covered to an attractive roundness without any of the grossness of the figure that is too fat. As an example of such a figure, let me call your attention to Mary Garden. No one would dare say she is fat. She is not. She never will be, for she has the nervous temperament. But in all her figure there is no angle. Yet its lines are long, the curves graceful, and the ensemble is most individual.

For the thin woman who would become plump there must be a radical change in her manner of living. First she must learn a lesson from her fat sister. It is not to worry. Almost always the fat woman is care free. She is amiable. She never worries and never nags. Diane de Poiters, the great French beauty, had to struggle against the encroachment of a sea of fat. The reason may be found in her answer to the question: “Why are you so beautiful?” Her reply was: “I am beautiful because I never worry.” The thin woman must stop worrying.

The thin woman is a spendthrift of vitality. She is never still when there is a chance for activity. It was of such a woman that the sardonic bachelor says: “She cuts up quilt pieces just for the fun of sewing them together again.” By which the bachelor meant to convey that she did needless work. The thin woman must learn to rest.

The woman who is too slender to please herself or others must look to her diet. Those foods which her fat sister must eschew she must habitually eat.

She, too, must have her daily baths and her massage, but they must be radically different from those taken by the woman who would diminish her flesh.

Since her greatest hope of increased flesh lies in food I will first discuss that. Here is a list of those edibles which contain the starch or sugar, or both, that are needful for the taking on of flesh:

Thick soups, as bisque, cream of celery, cream of corn, puree of peas and puree of beans; fat beef, fat mutton, hot corn bread, hot biscuits, wheat, corn and buckwheat cakes, plenty of butter, honey; salad dressings in which there is more oil than vinegar; chocolate, pastries, puddings, bonbons, bananas, peaches, prunes, beans, peas, cauliflower, asparagus, potatoes, rice, gelatines.

She should drink cocoa or chocolate made with milk; red wines if wines be drunk at all; tea or coffee, if drunk at all, must be taken with cream and sugar. She should drink more hot water than cold.

Cold baths I do not recommend for any woman. Her organism is too delicate, I think, to successfully resist the shock of a cold plunge or shower, but if any woman can withstand it it is the stout woman. It has been claimed to be a considerable aid in reduction of flesh. By that token, if by no other, the thin woman should avoid them. Her baths must be at least tepid. I should advise them as warm as she can comfortably take them. For while hot baths are enervating a moderately warm bath is soothing to tired nerves, and so tends to those easeful habits which the thin woman needs to acquire. The fat woman should rise immediately from her bath, dress and go about her affairs. But it is admissible, even desirable, for the thin woman to lie down for a rest of twenty minutes or longer after her bath. The repose that follows a warm bath is one of the best aids to gaining flesh.

A Turkish bath once a week may be taken, but it should be taken prudently or it will lessen the flesh. The thin woman should not remain in the hot room for more than ten minutes. After the scrub which follows she should not lie in blankets, as I have advised fat women to do, to promote further perspiration. Instead she should go to a slightly cooler room and there take massage while her pores are gaping as open hungry mouths to receive it. Massage with olive oil is a fattener. For each bath I recommend:

Olive oil, 1 gill; oil of bergamot, ½ teaspoonful.

After massage with the oil she should rest for a half hour before dressing. To remove the odor and other unpleasant souvenirs of the oil rub she should powder her body freely with talcum before dressing.

For those to whom olive oil is distasteful there is this massage for the meager body, which is much used in France and Germany: Tannin, ½ gram; lanolin, 30 grams; oil of sweet almonds, 10 grams.

This, which I have before recommended for building the adipose tissues of the neck, is excellent for the body, especially for the sunken regions about the collarbones, for the thin layer of flesh over the ribs and for enlarging the hips:

Cocoa butter, 100 grams; alcohol, 95 per cent., 20 grams; essence of rosemary, 12 drops; essence of bergamot, 12 drops.

Some skins are irritated by cocoa butter. For these pure, fresh lard could be substituted. A recipe somewhat difficult to fill this side of Paris, but which has been invaluable to thin women who desired to be plump, is this for massage cream:

Salep of Persia, 15 grams; powdered cocoa, 60 grams; glan doux d'Asie, 60 grams; potato starch, 45 grams; rice starch, 60 grams; thin gelatine solution, 250 grams; vanilla, 5 centigrams.

Another simple, pleasant and efficacious massage cream is made from:

Olive oil, 2 ounces; pure starch, 1 ounce; lanolin, 1 ounce.

While I am aware that in America there is a prejudice against perfumes, I cannot share in it. Since the days of the early Romans well chosen perfumes have added elegance to a toilet. It is only their abuse which is to be deplored. A dainty woman need not be told that she must use the perfume sparingly, that there should be a hint, not a bald statement, of them about her. But there is no question that certain perfumes have also a tonic medicinal effect. Therefore for the thin woman whose nerves require soothing I recommend this toilet water, used by English and French women when tired. A half dozen drops in a bowl of water is deliciously soothing, and leaves a pleasantly pervasive yet elusive perfume in the room:

Jasmine water, 3 ounces; vanilla water, 1½ ounces; acacia water, 1½ ounces; tuberose water, ½ ounce; essence of ambergris, 5 drops; tincture of benzoin, ½ dram.

The thin woman may use all of these things and yet note but little improvement. For she has but little appetite as a rule, and it is hard to fatten one who will not eat. She should go to a physician, tell him of her loss of appetite, and ask for a prescription for a tonic which shall be, as are most tonics, an appetizer. In lieu of that I borrow from a famous French physician, who contributed much to the beauty of women, this formula for an appetizer:

Tincture of nux vomica, 3 grams; tincture of rhubarb, 60 grams; tincture of star anise, 3 grams.

The woman who would be plump must add to her daily allowance of sleep. If she sleeps eight hours and is still thin she should sleep nine hours, or even ten. And she should take a nap of a half hour to an hour after her midday meal. She should exercise before instead of after meals.

Briefly this is the regimen I should advise for thin women:

Begin the day with a light breakfast in bed. The breakfast may be a pot of cocoa or chocolate made with milk, and sweetened with three lumps of sugar in each cup, three slices buttered toast, two medium boiled eggs.

Rest for at least a half hour; better an hour. The time can be utilized in looking after your correspondence on one of the convenient writing pads, in bed, in reading the morning papers or in making your plans for the day.

Then a tepid bath, as I have directed, followed by a slightly cooler shower to prevent your catching cold.

Then a short walk or a drive.

Luncheon of roast beef or mutton with gravy, any green salad with mayonnaise dressing, a cup of cocoa or glass of milk, bananas or peaches or pastry.

Between luncheon and dinner sip two or three glasses of milk, remembering that milk is food rather than drink, and giving five minutes to each glass. Follow the luncheon by a nap. If you can’t sleep at least rest.

For dinner eat any food that appeals to you that is of starchy or sugary or fatty nature. Avoid pickles, oranges and all acids.

In this diet use saving common sense. Do not eat of rich foods so freely that your digestion will be impaired and your complexion become mottled. Drive away insomnia by drinking a glass of warmed milk, a cup of cocoa or chocolate and eating a biscuit or two before retiring.

For the thin woman the rule against eating between meals applied to the fat one does not hold. She may eat whenever hunger moves her, for hers is a normal hunger, indicating need of more nutriment.

I think it is not well to try to guide the natural growth of a young girl toward slenderness or plumpness. Nature should have its chance to indicate rather strongly which way it intends her to travel, whether the road of thinness or fat. When this has become apparent, which is not until after sixteen or eighteen, it is quite time to supplement nature.

But for those readers whose growth will not be interrupted by any radical changes in manner of living, I would advise special attention to diet. Give a great deal of intelligent attention to nourishing the body. Keep in mind always the class of foods that form flesh.

Of the cereals corn, wheat and oats belong in this class. The bread made from them has the same properties, especially if they are used in their natural, unadulterated state. Corn bread, made from rough yellow meal and spread plentifully with butter, is one of the best means of adding to the weight of the body. Potatoes, if used in connection with eggs, cheese and milk are important aids in that direction.

A French physician of unusual skill prepares to fatten his thin patients by requiring them first to fast for a short time. Sometimes he asks that this continue for three days, though in my opinion forty-eight hours are quite enough. This is to clear the body of all remnants of former manner of diet. This is followed in his system by an exclusive milk diet of three more days, he permitting the patient to drink as much as she likes, but insisting on at least two quarts a day, drunk very slowly, ten minutes for the consumption of each glass, almost literally eating, rather than drinking it.

Should the appetite rebel at the milk it may be varied by an occasional glass of orange juice or of lemon juice and water, half and half.

The third step in this rejuvenating of the body before beginning to take the flesh forming foods, is to eat nuts and fruit freely for a day or two or longer, unless your appetite becomes too rebellious.

When you have begun with the flesh forming foods, which I have given and which always include meats containing considerable fat, be careful to chew them so thoroughly that all turn to liquid form in your mouth before swallowing.

I knew a woman once, extremely thin, who always ate a half dozen dates for dessert, after a full meal. To this she ascribed her rapid gain in welcome flesh.

Exercise gently while building flesh, but do not exercise quickly nor long at a time.

Drink water freely, and during meals one glass slowly drunk of cold water will not interfere with, but rather aid, in the digestion. One of the first measures taken by those who wish to reduce their flesh is the opposite--to avoid drinking water at meals.

Rest often. Sleep as much as you can, taking a nap at midday if possible. Thin persons are nearly all worriers. Fat persons, as a rule, do not worry.

Massaging the body with olive oil or vaseline aids in flesh formation. Drinking olive oil has the same result.

My prescription for the increase of flesh is twofold. I counsel peace of mind and eating flesh-making foods.

Generally speaking, thin persons are of nervous temperament. They have a positive genius for worry. Stop worrying and control your nerves. This can be done through the practice of common sense and the exercise of your will. Train yourself along this line and it will amaze you to see what progress you have made in a few months. It is possible not to let things and persons get on your nerves. Try it, and keep on trying, until the avoidance becomes a habit.

You will be less nervous if you take more rest. Sleep; or if you can’t sleep, remain in bed an extra hour or two, if possible, every night. And if your circumstances permit, take a nap or a half-hour or more of relaxation at noon. Rest after meals.

Aside from this nerve control and banishment of worry, the greatest aid in flesh-making is in the greater quantity and different quality of food.

Science has lately contributed a valuable item to the flesh-making foods. The pine nut, known as pignolia, is one of the foods richest in fatty matter and in fat-making ingredients. Dr. Harvey W. Wiley, the great food expert and advocate of the pure food law, calls attention to the fact that these small, sleek, white nuts are composed of nearly 60 per cent. of fat, and that the sugar and starch, also fat-making ingredients, in them amount to 17 per cent. of their composition. They have heat-making properties equaling those of butter, containing nearly four times as much nourishment as lean beef. This discovery I repeat, hoping that those persons to whom the idea of eating pork or fatty beef will be obnoxious will find an excellent substitute in this.

Butter is a fattening agent. Spread bread thickly with this and eat foods cooked in it, if you would grow flesh. But because butter and cod liver oil are believed to interfere in some cases with digestion, I would advise the free use of cream and milk instead.

As a rule the person who is too thin is anæmic, and those foods which rebuild the system will tend to round the body. For such persons thick soups are desirable. Thick broths are strengthening and rebuilding. Vermicelli and macaroni, added to thick soups, tends to fatten. In Germany I came on an anæmic young woman taking the cure at one of the baths.

“What is that you are eating?” I inquired, looking dubiously at a thick sandwich she ate with evident relish.

“It is a chopped raw beef sandwich mixed with chocolate,” she said. “It is delicious. May I order you one?”

I declined, for it happens that I dislike both raw meats and chocolates. But I asked her about her regimen, and found that part of her prescribed daily diet was sandwiches made of chopped or scraped meat prepared like the meat for a Hamburger steak, and mixed with beef or mutton broth, butter or cod liver oil, or, as a special reward of merit she was granted the variety she most liked, raw beef with chocolate.

Raw oysters were also permitted, but there was almost no lemon juice sprinkled upon them and vinegar was not allowed upon the table. Eggs she was allowed without limit, and she was urged to take them beaten up in milk from which the cream had not been removed. All cereals were admissable, especially barley, hominy, tapioca and cracked wheat.

It is commonly supposed that thin people are thin for natural constitutional reasons, and that it is extremely difficult, if not altogether impossible, to increase weight. It is true that many people hold a certain weight year after year, neither gaining nor losing more than a pound or two. It is also true that many efforts to increase weight accomplish nothing. But thin people need not be discouraged or settle themselves into the belief that it is impossible to gain weight.

An eminent physician tells me he has known people of middle age who have never varied more than a few pounds in weight for twenty years, to add thirty-five pounds in one summer. But this was accomplished, not by any haphazard luck, but by a most careful, persistent and intelligent system of nourishment.

Most people are accustomed to eat about the same average amount of food every day, and they are guided in the amount they eat by their appetite. The result is that, with about the same daily habits of life and about the same daily appetite, and with about the same consumption of nourishment day after day, the bodily weight continues at a fixed amount. If one is working extra hard, the appetite may be a little stronger, and the additional weight which might be gained is consumed by the extra labor which is being performed. During a summer vacation it often happens that there is a gain of weight of five or eight or perhaps ten pounds, but this is lost again as soon as the old habits of life are resumed after the vacation is over.

In formulating a system for increasing weight it is necessary to consider all of the many factors which may be made to contribute to the gain. Of course it must be understood at the very outstart that it is necessary to increase the amount of food we are eating if we are to increase weight. It is not difficult to understand that a person's weight, which is maintained at an even level year after year on a given quantity of food, is not likely to increase unless the quantity of food or the quality of the food is increased. But it does not necessarily follow that weight will increase simply by increasing the amount of food consumed. Many other factors enter into the problem.

It is probably almost universally true that we eat many things every day which are of little or no value. Our stomachs are often filled with more or less worthless food instead of things of great food value.

The most important single factor in gaining weight is the kind of nourishment that is taken.

Bread, meat, cereals, thin soups, desserts, crackers, pastry and most vegetables are of very little value in increasing weight.

Thick pea or bean soup, baked beans, Boston brown bread, rice, Welsh rarebit, cheese, raw eggs, chocolate, milk and cream are the great producers of weight.

It is, of course, generally well known that rapid and considerable gains in weight may be made by drinking large quantities of milk. The flesh gained by abnormal consumption of milk is likely to disappear as rapidly as it was acquired; and it is the opinion of many of the best physicians that too much milk puts a dangerous strain upon the kidneys.

Flesh gained through a milk diet is of doubtful value, but flesh gained by eating the highly nourishing foods I have recommended is of permanent value.

If a person is eating all his appetite demands, it may be asked how any one is to eat any more. One way of creating a larger appetite is to move your meals further apart.

If, for any reason, you are not able to get dinner until an hour or more after your usual dinner time, you feel a considerably keener appetite and eat considerably more. If you will apply this to all the hours for your meals you will find that you are eating a considerably larger bulk of food each day. Get up earlier in the morning and have a longer interval between your breakfast and midday meal, and you will eat probably ten or fifteen per cent. more at noon. Put off your evening meal an hour later, if possible, and you will find that you eat a considerably heavier evening meal than you had been eating.

The older you grow the slower are your digestive processes. It takes fully an hour longer for a person of forty-five to digest the same meal eaten by a person of twenty.

Everybody knows how pate de foie gras, which is the fat and diseased liver of a goose, is produced. In Strasburg, where most of the pate de foie gras comes from, the unfortunate goose is taken into a dark cellar and one foot is nailed to the floor. The goose is then fed all he will eat, and when he has finished his meal more food is poked down his throat with a stick. The goose is, in this way, stuffed with food day after day, and is not allowed to have fresh air or exercise. The result is that his liver becomes degenerate, fat and enlarged; and this is the way pate de foie gras is produced.

The same sort of thing works in the same way with the human anatomy, and if you are to stuff yourself with extra food and acquire permanent and valuable flesh, you must thoroughly oxygenate your blood by fresh air and a reasonable amount of moderate exercise. Sleep with your window open at night and take a walk morning and evening. Do not run, hurry or take violent exercise of any kind.

The chief factor in gaining weight is to come to your meals with more appetite than ever before and eat more than ever before. Eat things of the highest nutritive value. If you are beginning your dinner with thick, rich pea soup, try to eat two or even three helpings of it. Whatever else you eat help yourself to double the usual amount and try to eat it all. And when you are all through and think you cannot eat any more, then eat a liberal helping of cheese, and after that drink a glass or two of milk.

If such a meal taxes your digestion you may need help. The chief digestive agent of the stomach is hydrochloric acid, and you may add power to your digestive machinery by taking a little. You may at the same time stimulate the other gastric secretions with a little nux vomica. Here is a prescription which will probably help you to take care of your extra quantity of food:

Diluted hydrochloric acid, 3 drams; tincture nux vomica, 2 drams; peppermint water and distilled water, each 2 ounces.

Take teaspoonful in wineglassful of water 3 times a day after meals.

Now, this is not all. You may still take a little more nourishment before you go to bed. Try drinking two glasses of milk--always sip milk slowly, taking five minutes for each glassful. Better yet, break and beat two raw eggs into the milk before you drink it. If you can get sweet cream, drink cream every day. Half a glass of cream is a rather rich drink, but it can be made easy to digest by diluting it with seltzer. Get a syphon of cold seltzer and squirt it into the half glass of cream, and it makes a delicious, nourishing and digestible drink.

Malt and cod liver oil are admirable fat producers. There are on the market one or two honest preparations of malt and cod liver oil which are not unpleasant to take. A tablespoonful in a glass of milk makes a valuable drink.

You should arrange to weigh yourself every day. If possible get a bathroom scale and always weigh in the morning as soon as you get out of bed. Whatever you weigh at night you will weigh from one and a half to two pounds less in the morning. If not convenient to weigh without your clothes on, then be sure you weigh always with the same clothes.

CHAPTER XVII

EXERCISES THAT HELP MAKE YOU BEAUTIFUL

There are exercises that reconstruct, build over, and there are exercises that destroy, chiefly by excess. I am going to tell you of the first sort. The second may be dismissed as violent exercises. Violence is always a destroyer of beauty. Excessive exercise with heavy dumbbells, whose weight exceeds the strength of the person wielding them, I mention as one of the worst of these destroyers.

I have before said, and I am glad to have an opportunity to repeat, that I disapprove of heavy exercise for women. Extreme physical effort taxes the strength and leaves its marks upon the countenance, writing the heavy, disfiguring characters of fatigue. It overdevelops the muscles, robbing the figure of its soft, delicate outline, making it bumpy, unseemly and masculine.

Exercise for women should have three aims. First, securing as much fresh air as is needed for health. Second, as much motion and adjustment of the internal organs as are needed for health. Third, for the correction of such habits as are threatening to the health and disfiguring to the beauty. A good eclectic system of exercises serves all these purposes.

A simple exercise that I have long used when I noticed a tendency of the shoulders to sag forward is to place my arms behind me, bend them at the elbows and thrust between the back and the elbows my brother’s cane. When he rebelled or when he and his precious cane were absent, I used my own umbrella or sunshade. The temporary support drew the shoulders far back and expanded the lungs so greatly that it became my favorite exercise. In this attitude I walk about the room many times, or, standing before the open window, tightly close my lips and breathe deeply. This I continue for fifteen minutes, unless my arms grow very weary, in which case I cease for the time, beginning again in a few minutes when I have rested. In all exercises I stop short of the point of fatigue.

For a sagging abdomen, slow, regular bending exercises are best. Stand with the arms raised above the head and the palms forward. Keep the elbows straight. With a slow, sweeping motion bend forward until the tips of the fingers reach the floor in front of you. This is difficult, especially for the stout and those with muscles stiffened from lack of use.

When you have mastered this exercise, by practise, thrust the hands clasped at the finger points as far back between the knees as you can. In this way a semicircle is described at one sweeping motion, and the abdominal muscles are strengthened at the same time and the abdominal organs stimulated.

For inactive, heavy back muscles the rotary trunk motion is best. Bend the body forward from the waist line, and swing the upper part of the body slowly around as though the waist were a pivot. Move the trunk slowly to the right as far as it will go, then to the left as far as possible. Sway slowly from the extreme right to left and back again, being careful not to wrench the body. These last two exercises are invaluable for setting sluggish intestines at work.

Hundreds of queries are sent me putting in various ways the one essential question: “What shall I do for a muddy complexion?” Let me answer all those questions now and briefly. Set your sluggish liver to work. The exercises I have just described will aid in that most necessary work. So will walks long enough for sufficient exercise, yet not long enough to exhaust you.

If all these, together with much water-drinking, fail to correct the liver-marked complexion, this will be assuredly helpful: Standing perfectly erect, raise the right arm as high as you can, stretching the left arm downward at the same time. Reverse this motion, and alternate the two. This air-sawing, done rapidly, will bestir the laziest liver.

For chronic indigestion I recommend walking, varied by rope-jumping. After a brisk walk, return to your room and, resting briefly, jump the rope from twenty to fifty times. Your strength must determine the number. It is better to begin with ten times and increase the number to fifty, or even seventy-five, as you become accustomed to the unusual exercise.

A favorite exercise of mine is the simple, easy one of sitting straight. Sitting straight develops the habit of poise. I sit every day before a mirror, and at sufficient distance from it so that I can see my reflection at full length. I note whether my chest is high or drooping. If high, I know that my figure is at normal. If drooping, I at once seek the cane or umbrella of which I have spoken and take the shoulder and chest raising exercise I first described, and which I call my “uplifting” exercise.

This I vary by clasping my hands behind and letting the head rest in them as a cup, while I inhale and exhale profoundly, moving the head slowly in its socket of clasped hands from one side to the other.

Swinging about on my revolving dressing stool, I note closely and critically my profile from brow to toe. If my chin tends to sag, seems by the slightest tendency to sag, I lift it as high as I can and, closing my teeth tightly, draw the backs of my hands alternately across it. I repeat this exercise fifty times, until the chin tingles and I know that the renewed circulation is doing its work of restoring the firmness of the muscles. My chin, I may explain, seldom displays the pendulous tendency, for I sleep with a very low pillow or no pillow at all. The high pillow I regard as one of the greatest enemies of beauty, for it causes curving shoulders and heavy chin.

Deep breathing is in itself a superb tonic, and certain exercises aid greatly in forming that habit and developing the power to breathe from the very extreme of the lungs, creating, so to speak, a continual draught in the lungs. Climbing is one of these. The well-known value of mountain-climbing is due to the fact that it necessitates deep breathing. If mountain-climbing is not open to you, there must be hills within your reach. And there are always staircases. This exercise, being somewhat taxing, should be moderately and gradually taken. Climbing develops the calves and thighs.

A horse is a splendid colleague in the work of upbuilding. A gallop sends the “reconstructive” fresh air, the true carpenter of the body, rushing through the body, doing his work quickly and well.

Young women who complain of dark circles under the eyes admit, by describing that symptom, depressed circulation. All of these exercises that develop the power and habit of deep breathing correct lowered circulation and impoverished blood and cure their unlovely symptoms.

From India, where the gospel of deep breathing as a spiritual as well as physical aid was born, comes a method of deep breathing that is wonderfully quieting to rebellious nerves. Close the eyes, and with the forefinger pressed closely against the left nostril, completely closing it, inhale and expel the air solely through the right nostril. Next, closing the right nostril by placing the forefinger upon it, breathe deeply through the left. Reverse these operations, and continue this alternate breathing for several minutes.

For clearing clogged lungs this, also derived from India, is useful: Inhale naturally and deeply, but expel the air slowly and thoroughly from between the lips, letting it escape with a whistling sound. Remember, however, to inhale through the nostrils alone, expelling only with the lips, for while germs cannot be drawn into the system through the nostrils, the fine hairs which line the nose being nature's sieve, they swarm from without into the open mouth at the slightest chance. That chance is afforded by the intake of air. This outrush, of course, bars their entrance.

It is really one of the simplest things in the world to have healthy lungs. Sit erect, stand erect, walk erect. And if you go through life sitting correctly, standing correctly and walking correctly, you will breathe correctly, and, breathing correctly, you will have healthy lungs.

And in order to have a good pair of lungs, a working machine that will serve you well all your life, begin at once--the younger you are, of course, the better--to build up the muscles between the shoulder blades, the muscles at the top of the shoulders and the muscles at the back of the neck.

Fresh air you must have, of course--plenty of it. But of what avail the purest oxygen if there are districts in that wonderful region inside your ribs where a breath of fresh air can never reach. And those are the very spots where pulmonary germs, like Jeshurun in the Bible, wax fat and kick. When one has little plague spots like these inside of his anatomy, fresh air and exercise, the usual prescriptions for sick lungs, are of no great value unless erect sitting, standing and walking are systematic and continuous habits. Then only are fresh air and dry sunshine of avail to affect radically the germs of tuberculosis.

Begin right off now. Straighten up. Whether you have well lungs or sick lungs, start exercising. The results obtained by even the simplest gymnastics are often magical, not only as a gain in health but as a distinct asset of physical beauty. One of your shoulders may hang a little lower than the other; that will work much harm to a depressed lung. Look to it always that your shoulders are well up in the air and well back. Lift up and throw back your shoulders so that your shoulder blades will lie flat on the back of your ribs, with the tops of the shoulders themselves pointing directly upward. Make this a habit.

I myself exercise but little. The reason is apparent. I am of slight physique, requiring rather a fostering of the vital spark than a lavish expenditure of it, in the direction of muscle making.

Light gymnastics after the bath in the morning, and a drive in the afternoon quite suffice for me. Since I never grow fat there is no need of training down. Therefore the exercise I take is quite enough for my needs.

But for American women, with their tendency to grow fat, this, I know, is not enough. While I believe there should be only enough exercise to properly tone the body, yet some require much more for this purpose than others, and there is not enough toning, when the body grows fat.

There is no one form of exercise so generally tonic to the system, I think, as walking. If a woman be of the bilious temperament, with an inclination to grow sallow and heavy-eyed, she needs longer walks than the woman of sanguine temperament, whose blood leaps through her veins and seems to seek escape by way of the mounting blushes in her cheeks.

A woman who needs walking, and she and her physician should be the best judges of whether she does, may begin by walking five city blocks and end by walking five or six miles. She should increase the distance gradually, for one long walk may be of brief benefit, but regular long walks are of inestimable value. It is never well to begin suddenly violent, unaccustomed exercise.

The chief value of walking is that it forces deep breathing, and deep breathing causes a cleansing of the intestines, as when a blast of cold air is introduced into a furnace it burns up all the refuse that while the fire was low clung to the sides and back of the grate. Here is a fact that should be kept hanging on a prominent peg in the memory. In ordinary instances, when a person rests he breathes four hundred and eighty cubic inches of air a minute. This is much less than is needed for cleansing the body. That is the reason why I oppose too much sleep. During the sleeping hours the amount of air we breathe is much reduced. That is the reason why many persons look at their worst when they rise in the morning. Lack of the amount of oxygen they take into the body when they are moving about, leaves their cheeks pale, their muscles sagging, and their eyes dim. Note how much handsomer you are an hour afterward than immediately upon rising.

On the other hand, while walking at the rate of four miles an hour, which is not the maximum rate, you will inhale five times as much air, that is 2,400 cubic inches, in the same time. Have you a room or suite of rooms, containing four windows? Have you opened one, and, finding that the air was not being freshened fast enough, have you opened the other three and noticed the instant

improvement? That then must be the best argument for walking as against driving.

If you form the daily walk habit see that it becomes a daily habit. Don't stay indoors, because it is too hot, or because it is raining. One should not take her daily walk in midsummer while the sun is highest. Rise earlier and take the walk in the dewy part of the day before breakfast.

If it is raining dress for the walk in the coquettish little rubber boots that are now fashionable, and the short serge or flannel walking skirt, and the little Tam o'Shanter or turban. Thus garbed, you don't care how wet you become. Leave your umbrella behind and let the rain pour upon your face. It will be the most grateful bath you ever had in your life. The rain bath for the face is delicious. Having had one you will lose no opportunity to take another. You will see in your glowing cheeks their first resemblance to the rose complexion of the Englishwoman, the finest complexion in the world.

The walk is cheaper and its effects a thousand times more lasting than any cosmetic. It throws off the enveloped cloak of lassitude that hides beauty. No woman is so attractive when she is listless as when she is thoroughly and happily alive. The walk awakens the sleeping or submerged self. It makes life under any circumstances seem worth while. And a woman, to keep her beauty, must always think life worth while.

I have seen a woman start on her walk pale, dull eyed, with the drooping lips that give the appearance of greater age, and have seen her return from that walk an hour later, her sallowness replaced by a clear pink skin, her eyes youthfully bright, her lips curling upward, the sign of content, her step springy. By the magic of the walk she seemed at least five years younger. Most of the famous pedestrians live to an old age. In a small town in America lives a man of seventy-five who recently took a two hundred mile walk in three days, stopping only for short rests of a few hours. He returned home, having rid himself of a bilious attack.

Another seventy-year-old youth walked off the rheumatism in a ramble from San Francisco to New York.

Therein lies one of the greatest values of the walk. It eliminates lingering, self-made poisons from the system.

An excess of uric acid is just now the fashionable affliction. No one suffers from it who is an habitual walker. Rheumatism and gout are caused by the settling of deposits about the joints. Those deposits of poisonous matter are not permitted to form if there is a thorough elimination by means of walking and much water drinking.

Indigestion in its various forms can be corrected, especially in the earlier stages, by walking, in connection with careful diet. Indigestion is a physical failing, especially peculiar to women. Walking, by bringing into play unused muscles and by making deep breathing necessary, as a walk always does, relieves this condition. Whatever clears the internal organs clears the complexion. Whatever naturally clears the internal organs brightens the eyes. Whatever promotes deep breathing lays in a new stock of vigor, as we fill our cellars with coal in the winter.

Riding is good exercise for women, if not taken in excess. Its drawback is that the side saddle forces one hip and shoulder higher than the other. If a woman rides she should by all means ride astride, so obviating this difficulty.

While I take my own morning exercise after the bath, with no aid whatever, dumbbells are valuable to those who "cannot become interested in freehand exercise." I should advise beginning with the smallest dumbbells made, those weighing one to half a pound.

Wrapped in a lightweight woolen bathrobe, and wearing tights or knickerbockers, hose and sandals or slippers, let her stand before the open window while she manipulates the dumbbells. With shoulders back and chest thrown out and head erect, let her curl the dumbbells twenty times, meanwhile breathing slowly and deeply in time with the exercise.

Start with the dumbbells at the shoulders and push them high over the head, counting and breathing deeply twenty times.

[Illustration: MADAME CAVALIERI IN HER MUSIC ROOM]

Rest for five minutes, the dumbbells standing on the floor in front of you. Bending your knees very little, but keeping your arms straight, rise to an erect position, with the dumbbells resting at your waist. Repeat this exercise, but raising the bells as high and as far behind your neck as possible.

Now start with the bells held by the arms in a horizontal position. Raise the bells until they are high above the head, then lower to the first position, keeping the elbows straight.

When this exercise has become easy, turn back the face until you are gazing at the ceiling. Breathe deeply. This is one of the best known exercises for chest expansion. The others develop the back, arms, chest, shoulders and waist.

This is valuable to correct a torpid liver. Stand erect. Raise the right arm, reaching as far as you can with it, at the same time pushing downward with the left hand. Reverse this movement, pushing upward with the left hand and downward with the right hand. Alternate until you are nearly breathless.

For a flat chest this exercise without apparatus is helpful. Shrug the shoulders as high and as fast as possible, ceasing only when you become dizzy. This, if the shoulders are even. If they are uneven, practice raising the defective one alone until in the course of weeks or months they are straightened, or carry a high cane on that side.

For the girl who has not learned to breathe correctly--that is, deeply, it is well to stand before the open window, and with her hands raised, the palms outward, inhale deeply, counting ten, hold, counting ten, exhale, counting ten.

Or this: Clasp the hands behind the head, the palms supporting it, and with the chest thrust forward, inhale, count and exhale as advised. If this at first causes giddiness count but four and gradually, as the body becomes accustomed to the new exercises, increase the counts to ten, and even to twenty-five.

For a stretching of all the muscles the best exercise I know is to clench the fists and, raising the arms, with elbows unbent, above the head, stretch the body to the greatest possible height.

Another to give suppleness to the body is to rise on the tiptoes, then lower the body until the weight rests upon the soles, then up and down again fifty times. I have known persons so infatuated with this exercise that they repeated it two hundred, and even five hundred times a day.

One warning: Never carry exercise beyond the point of slight fatigue. Never let it reach the point of exhaustion, for exhaustion, like illness, is a synonym for ugliness.

Women fancy that a weak back is the heritage of their sex. They fancy that aches and pains in that region are inevitable. In this they are mistaken. The back may be rebuilded and strengthened as can other weak spots. Discreet exercises are the best aid in that desirable direction.

For children who are growing round shouldered, shoulder braces are, for a time, beneficial, for they train the muscles to erectness. When this training has been accomplished the braces should be removed and the child required to practice the carriage the brace has taught him. But for a grown person I never advise braces except as a last resort in a desperate case, and particularly in cases of lung affections, to require the person to inhale fresh air.

We often receive the advice, “Rest your back to stop its aching.” This is sound advice in cases of extreme fatigue, but generally the best way to rest the back is to strengthen it, and the way to strengthen it is by well directed, but not violent, exercises.

Every muscle in the body is there for some use. Everyone should have enough exercise to keep it healthy. The muscles of the back are weak because they are so seldom used.

The best exercises for development of these neglected muscles are those which involve stooping. Spoiled, pampered beauties test themselves by stooping, and if they can touch the floor with their finger tips, without bending the knees, they pronounce themselves fit. Women less spoiled and pampered have far less anxiety about keeping fit. Their everyday work requires enough stooping to keep the muscles of the back flexible and the muscles of the abdomen firm, and of normal size.

Lifting moderate weights from the floor is a good exercise for strengthening the back. If the back be very weak it is well to begin with an empty bucket. As exercises strengthen it gradually fill the pail. A basket with a handle may serve the same purpose. Stoop slowly, and slowly lift the weight. Keep the leg muscles tense and make the muscles of the arms tense. Reach slowly forward and lift the weight with both hands. Lift it on a level with the waist line. Then lower it as slowly to the floor.

Next to stooping, twisting the muscles of the back is a good exercise for strengthening it. But let this twisting be slowly and gently done, or this will be one of the instances in which the remedy is worse than the disease. Violent exercise will only make the muscles weaker and cause a more severe ache, and possibly a severe injury, by wrenching them.

This is the best method for the twisting. Lift the arms slowly above the head, with the elbows unbent. Then slowly turn the body to the right, resting its weight on the left leg. Swing the body around, keeping the arms above the head but shifting the weight to the right leg. This is a most valuable exercise, for it contorts the muscles, causes a supply of blood to flow through them and by the unusual action they gain strength.

The same exercise as the foregoing can be advantageously done with the arms stretched out horizontally before you, and swinging them in a large half circle, being careful to shift the weight from one leg to the other and keeping tense the muscles of the legs on which the weight rests.

As a rule round shoulders are the sign of weakened muscles. Or the appearance of round shoulders may be given by a too great accumulation of fat across the shoulders.

A good exercise to correct this is a simple squaring of the shoulders, drawing in at the same time lungs full of air. Push back your arms so that the forearms are on a level with the waist and the elbows are pushed as far back as possible. By a gentle sawing motion move the elbows forward and back. This causes a rush of blood to the muscles surrounding the shoulders, and nourishes the muscles which you are exercising and banishes the fat cells.

To banish fat from the back draw the arms back as I have described. Thrust between the back and elbows a stout cane or a broomstick. Manipulate the cane by means of the elbows so that the muscles are not only strengthened but the cane is rolled over the flesh. The effect is to break the fat cells.

This is sometimes more easily done if you hold the cane in a diagonal position.

Useful to the same end is the exercise of sitting erect in a chair and exaggeratedly shrugging the shoulders, first one, then the other, then both together.

Work with light dumbbells will also in time reduce the fat of the back, but I counsel the use of light clubs and these in moderation. Standing erect, the feet resting flatly on the floor and the knees unbending, raise the dumbbells slowly above the head without bending the elbows. As slowly lower them until the arms hang loosely at the sides.

If you notice that one shoulder is higher than the other, give heed to your hips. The hip on the other side is probably thrust up and the shoulder on that side sinks, the shoulder on the opposite side rising to balance it. So if one shoulder is high, correct your way of standing. Stand with the weight evenly divided and rest on the balls of your feet. Your shoulders will drop naturally into place. Keep them in place.

Have you ever thought of the broomstick as an aid to beauty? Jesting? Not at all. I wish to convince you that that everyday tool for keeping your home clean is a means of making yourself handsomer. Indeed, yes.

Sweeping itself is an admirable exercise. It gives a variety of activity by causing several of the least used muscles to stretch and contract. Sweep vigorously and thoroughly and you will feel the rush of blood to the muscles of your forearm, to the muscles surrounding your shoulder blades and to those at the small of the back. And, more valuable than any of these, it causes you to bend the body at the waist, thus strengthening the muscles which are weak in nearly all women, those of the abdomen, muscles which, allowed to become weak and flaccid, cause that part of the body to sag, giving an unlovely prominence with the ugly bulge at the hips which caused a visiting artist from Europe to sneer:

“Ah, the great American figure is not, as I thought, the Almighty dollar. No, it is the unexercised forms of the women.”

The American woman has learned to develop and keep in control the upper half of her figure. Fine chests, with a graceful line from the shoulder to the bust, have grown common among American women. Many of them have mastered the not difficult art of deep breathing, so expanded the chest, developed the lung power and perfected what may be termed their upper halves.

But the glaring defect remains--the clumsy, conspicuous lower half of the body, which can only be made pliable and symmetrical with the rest of the body by exercises, among which note this simple one I have named, sweeping. Any household exercise that causes you to bend at the waist to the floor will keep the hips and abdomen in control, and in time diminish their size.

For this reason, if not for that of neatness, never lose an opportunity, if your figure has the defect I mention, to stoop to pick up a bit of paper or lint, or a scrap of cloth, from the floor.

Stoop from the waist. Don't resort to that trick of the indolent or the awkward, falling upon the knees when you pick up anything. Stooping is a graceful posture. Learn it.

If the defect in your figure is the other sort, the broomstick is still your friend. But use it in a different way. If you have a weak, narrow chest, if you are round shouldered, you should apply yourself to development in a different direction and your sweeping should not be the main object, but an incident, of your broom handle exercise. And if you are of this habit be sure to protect your not robust lungs from the dust raised, to some extent, by sweeping, even though the broom be swathed in a damp cloth, by keeping your lips firmly closed. Dust is nearly always disease laden. While the dry disease germs might continue their way through the air without causing breeding of disease, the darkness and moisture and the weakness of your lungs, to which they find their way through the open mouth, will stir them into new life and you will be the victim. Never, in any circumstances, inhale through the mouth. Occasionally to rid the body of an excess of carbonic acid gas you may safely exhale through the mouth to still further purify the body. Never, never, take in air through the mouth. Don't allow the nose to become lazy. To inhale air is its duty. Force it to perform it. And aid it by keeping the nostrils free from clogging substances.

The broom stick will serve its best purpose for you by being shortened, cut to a length of two or two and a half feet, according to the "reach" of your arms. Grasping the stick firmly, with a hand at either end, hold it high above the head and draw the air in deeply, filling the lungs to their capacity with full draughts of air. When you have filled every cell of the lungs with the fresh air hold the stick firmly above the head, count silently at least five. This done, drop your arms slowly, your hands still clenching the stick, in front of you, below the waist. While doing this expel the air gently until you feel that the lungs are almost empty of air.

It is not enough to say to most persons: "Shallow breathing is a bad habit. Correct it." The active human mind is an interrogation point and demands the courtesy and satisfaction of an answer.

Well, then, the results of shallow breathing are these: Sensitiveness to all the conditions that cause colds, and a disposition to allow colds to deepen into consumption or widen into pneumonia. Shallow breathing makes the liver lazy, and soon the body is bile flooded, the eyes becoming dull and the complexion yellow and lifeless. Clogged stomach and intestines are the marks of the shallow breather, for the body engine has not enough oxygen draught to burn up the fuel that has been thrown into it as food.

It is only the deep breather who enjoys life to its full and shows her enjoyment of it.

If you are not already an out-of-door woman become one at the earliest opportunity. Make a business of learning at least one of the outdoor sports.

Shall it be golf? Then you will have chosen well, for golf develops the muscles which are not strong in women, those of the back. By encouraging deep breathing it develops her chest. By causing her to bend considerably from the waist it strengthens her abdominal muscles. Because it causes her to walk a great deal it strengthens weak ankles and develops the muscles of the lower leg. These points, remembered and practiced, will make you a better golf player and will develop your health and strength in a corresponding ratio. Select your clubs with careful view to their length, and this will depend upon your own height and the length of your arms. To choose a club that is too long is as foolish and injurious as it is, if you are short, to sit upon a chair so high that your feet dangle.

Learn a good position for your strokes with wooden clubs at the very beginning. You should be erect. One leg should be straight under the body. Its heel should be on the ground, the toe a little pointed in. Slightly below the hips and not more than four inches from the body should be the level of the grip.

Because freedom of the wrists is so very important better practice when not on the links with a cane or closed umbrella. Place the hands together and hold them quite still in front of the hips, depending for the motion of the stick entirely upon the wrists. Remember that the golf stick swings on a pivot formed by the hands and wrists.

One of the benefits of golf playing to a woman is that it teaches concentration. The eye must be kept upon the ball, not before it is struck or while it is leaving the sward, but after it has left the ground.

If you take up lawn tennis play in moderation, especially at the beginning. I like tennis for women because it induces a fine flow of perspiration that will carry the clogging poisons out of the system. It stimulates the circulation and forces deep breathing. It has the further value of distributing the exercise rather generally throughout the muscles of the body. Many women play tennis, but few play it well. A reason is that they are careless in learning the first principles of the game. They are liable to grasp the racket loosely, and this spoils their play. Relax your grasp and the racket will turn in the hand while you make your stroke. Always hold it by the

extreme end, letting the leather binding on the handle rest against the palm.

For your preliminary practice before you play a game that is watched by critical friends practice strokes alone. Bat the ball against the kitchen door or the barn door or the neighbor's fence.

You will have spent your vacation well if during it you learn to swim.

Train yourself to the confidence and fearlessness that are necessary to master swimming. Make yourself realize that you need not fear deep water. It is no more dangerous to have two feet of water over your head than as many inches. This is especially true of salt water, for the deepest water has the greatest power to hold a body on its surface.

CHAPTER XVIII

POSTPONING THE DREAD SIGNS OF OLD AGE

Every woman is haunted by a specter, the dread ghost of old age. At sixteen girls begin to dread it. At thirty-six women set traps for it. At sixty they ward it off as best they may. I will tell you to-day what are the marks of old age and how to remove them.

Women search their faces in the mirror for the first faint lines that they fear may develop into wrinkles. The importance of these lines they greatly exaggerate. For example, there are even on a baby's neck two parallel lines known to experts as "lines of beauty." Others have named them "the collar of Venus." Women foolishly try to remove them, while the truth is that if a woman does not have them she lacks a recognized sign of beauty, and writes herself down to all beholders as so fat that her flesh has swallowed up her Venus's collar.

The infallible first sign of age is the sagging cheek muscles. These are more serious and more difficult to treat than wrinkles. When, at the merciless inspection of her face, which every wise woman gives herself in the morning, a woman detects signs of these sagging muscles, she must at once get to work upon them. The sagging muscles indicate that they have grown too weak to remain in place, and they must be assisted, strengthened. The way to strengthen them is to cause freer circulation in those parts that are affected. And the way to stimulate circulation is to massage the surfaces where circulation is desired.

But one must be very careful about the massage. Bad, that is, unintelligent massage, is worse than none.

Study the drooping cheek muscles and you will notice that they are apt to sag from the cheek over the edge of the lower jawbone, and try to melt in an ungraceful way into the neck. This is not to be permitted. The jawbone should keep its thin, fine edge to the end of life. The nearer it is like a razor edge in sharpness the nearer you are to keeping the facial line of youth. Some babes are born moon-faced and moon-faced remain. But it is true, nevertheless, in the large majority of cases, that if the lower edge of the jaw is of knife-like sharpness the woman who possesses it is young. If it be muffled by flesh the woman is old or is growing old.

Since the flesh is inclined to melt down into the chin, so forming the double or triple chin, it is necessary to massage that surplus flesh. Strengthen the muscles of the true or normal chin thus:

With a pure massage cream give one stroke to the muscles of the chin with the right hand, then with the left, and so alternate. Pass the hands from side to side, one under the other. When you have made twenty such strokes give your attention to the cheek muscles proper. With the tips of the first, second and third fingers rub slowly and gently, with a rotary motion upward and backward along the line of the jaw, and upward to the hair line. Repeat this operation again and again until the cheek muscles and the fingers are weary. When they have rested begin again, this time with the softer flesh above the jaw. Use the first three fingers again and let the motion be backward and upward again, but the pressure should be much lighter, for these muscles have not the bony support of the lower ones, and it is always hazardous to work other than skillfully on such muscles. For instance, the flesh just beneath the eye should never be touched.

Twice a day is often enough for ordinary cases. But in extreme cases ten minutes for massage four times a day is not too often.

Also let the woman whose cheek muscles are beginning to sag and who by the same token is acquiring a double chin, remember to keep up her head. Ordinarily a woman may turn to the flower for lessons in beauty. In this instance she must look to the horse. How much handsomer is the horse that carries his head high, and how much younger he looks!

Keep your head up while you are walking, while you are talking, even while you are resting. Did you ever see a beauty, even when in repose, allow her chin to sink upon her breast? Not while she is conscious. No, no. When she is exhausted from a long walk or a dance she rests the back of her head against the back of a lounging chair, but her chin is always up, always. And this not only while she is awake, but while she is asleep. Do not sleep upon a pillow if you can possibly rest without it. Or, if you must have a pillow, let it be very small. And try to lie on your back, with your chin up. That is the best position for health and beauty.

And now about another particular sign-post of age. There is a saying which persons always accompany by pointing to the delicate lines in front of and extending below the lower portion of a woman's ear: "That is where a woman first shows her age." In part that is true. There is one extenuating fact. Some ears are set much closer to the head than others. Those that are set well back and in draw the skin with a drum-like tightness at the base of the ear. Lines never form about ears so set. But if they grow well away from the head the skin about the ear is loose and the lines are sure to come between thirty and forty. I have seen them come about the ears of girls of nineteen. They too can be removed by massage. Use the third finger of each hand and massage with both hands at once, rubbing slowly, with gentle rotary motion upward.

I have known some women to pin back the ears. So they call it; but it consists merely in passing a band of white muslin around beneath the nose and sloping upward about the upper lobes of the ear, thus pinning, or pinioning them. This done for eight hours of every twenty-four, when the person is asleep, should do a great deal toward smoothing away the betraying little lines.

Another sign of age appears about the ears. There, as a rule, the hair first begins to grow gray. It would be well to cut rather than pull out these first gray hairs, for the hair pulled out usually means a mutilation and irritation of the scalp in that part of the head. But if they persist in growing I would recommend resignation--or dyeing. I do not advocate hair dyes. The only substance I know that I believe is not injurious is henna, which the Egyptians, who had wonderful hair, used. But henna gives the hair a reddish cast. If my hair were growing gray and thin about the ears and temples I would massage those parts often with lanolin.

Dull eyes and dark circles under the eyes are believed to be one sign of departing youth and vigor. Quite as often they are signs of impaired health, of anæmia.

If you are anæmic, you should go to a reliable physician and get a prescription for some good rebuilder. If this is not possible, give yourself the good home treatment of plenty of sleep, of more than the usual outdoor exercise, and of a diet of eggs, beets, spinach and string beans, all those things which contain much iron.

For the woman who is beginning to "show her age" I prescribe much rest, but never rest after a meal. She should rest before meals, say a siesta of an hour and a half before luncheon and dinner, but not immediately afterward. Rest after a meal induces flesh.

A sign of age is a dragging gait. The woman who wants to remain young should repair the waste by more rest. When she is in the privacy of her room she can completely relax. But for her in public there should be no relaxation. Let her remember the tendency to this dragging and in public be as truly on parade as a soldier at guard drill.

Also in the older woman we note bent shoulders. They should be straightened. Best of all by massage. A long, full stroke over the shoulders with the palms of the hands, meeting at a point between the shoulder blades. If massage did not cure I should try the shoulder and back braces sold at pharmacists'.

But massage with pure cold cream, tested and analyzed by a chemist, is the best friend of the older as well as the younger woman who wishes to be beautiful. This is excellent for oily skins:

One ounce tincture of benzoin; two drams tincture of musk; four drams tincture of ambergris; five ounces rectified spirits; one and one-half pints orange flower water.

This I recommend especially for delicate skins easily roughened by the wind:

Three ounces almond oil; five drams white wax; five drams of spermaceti; one dram oil of bitter almonds; three ounces elder flower water; one ounce witch hazel.

This, a simpler cream, is wholesome and efficacious:

Four ounces almond oil; four ounces rosewater; one ounce spermaceti; one ounce white wax.

This is an excellent preparation also for an oily skin:

Six ounces orange flower water, triple extract; one ounce deodorized alcohol; one ounce blanched bitter almonds; one dram white wax; one dram spermaceti; one dram oil of benne; twelve drops oil of bergamot; six drops oil of cloves; six drops oil of bigarade; one-quarter ounce borax.

This is an excellent massage cream, having cleansing properties:

Three ounces oil of sweet almonds; two drams balsam of tolu; ten drams oil of bitter almonds; two drams benzoin; two drops essence of lemon; two drops essence of cajeput.

An exquisite cream, much used by those who are fastidious, is this:

Four ounces oil of sweet almonds; six drams white wax; six drams spermaceti; two drams borax; one ounce glycerine; five drops oil of neroli; fifteen drops oil of bigarade (extracted from orange skin); fifteen drops oil of petit grain.

Some women of the old school prefer a liquid preparation to a cream. One of these was the beautiful Queen Elizabeth of Hungary. Her complexion was once the toast of Europe, and this when she had reached a very advanced age. I have used this modification of her favorite lotion for the face:

One-half ounce oil of rosemary; two drams oil of lavender; thirty grains oil of petit grain; three drams tincture of tolu; one-half pint orange flower water; five ounces rectified spirits.

Let us consider first the cause of wrinkles. The causes, rather, should I say, for the sources of wrinkles are five. They are: Age, worry, weariness, the bad habit of making faces, and the shrinking of the flesh away from the skin.

We cannot arrest age, the process of growing old, but we can conceal for a long time the fact of age. I believe it is quite possible for a woman to say, “From this moment I shall not appear to grow older,” and to achieve that end. I have known women who have seemed to stop short the revolutions in the wheels of time for twenty years. Others I have known who by a new regimen, or by changing their mental attitude toward life, accustoming themselves to that most wonderful of all rejuvenators, taking a more cheerful view, have seemed to grow five or ten years younger.

Age is not an inevitable creator of wrinkles. It merely deepens the tracks made by our thoughts, wearing them deeper and deeper with the years as the wheels of a wagon cut deeper and deeper into the clay of a country road. It is to be seen then that prevention is a large part of the treatment of wrinkles. To cure wrinkles first look to it that you do not acquire them.

Worry is another foe of the childlike smoothness of skin that is one of the most desirable states of beauty. The outward and visible signs of inward worry appear chiefly in two areas, in the diagonal lines extending from the nostrils to the lips, and in the forehead where they create what a precocious child, studying his mother’s face, called “gutters for the tears.” These lines are interesting as indicators of character. The woman with deep lines about her lips has greater determination and passion. She has a more intense emotional nature. The woman with the strongly marked horizontal lines in the forehead is more intellectual. Her anxieties are mental, while those of the woman with the parentheses are temperamental. To the woman with the ever growing deeper tracery on her forehead I should say, “Don’t fret.” The woman with the fast deepening parentheses I advise, “Don’t care.” Consider these bits of advice. The distinction is illuminative.

The accustomed eye sees readily the characters written by fatigue. They are rather creases than wrinkles, deep folds in the skin, as though the covering of the muscles had grown weary and limp, and was resting from its task of smoothly fitting over the muscles. They are perhaps the most disfiguring of the wrinkles and the hardest to remove.

[Illustration: KITTY GORDON Her arms, neck and shoulders furnish an ideal which every woman should try to attain.]

The bad habit of making faces--I shrink appalled from my task of preventing this, or of counseling how to remove its traces. Some women, especially American women, have yielded to the ugly habit thinking that the lines that follow it are the price one must pay for her vivacity. But they are mistaken, hopelessly, fatally mistaken. One of the most vivacious faces I have known is that of a beautiful French woman. Her face is like a mirror, but the eyes and mouth are the only reflectors. She does not draw the mouth down at one corner or the other while she talks. She does not raise her eyebrows until they threaten to become lost in her hair, puckering the skin at the corners of the eyes as though there were a drawing string beneath them. She does not prove her concentration upon a topic of conversation by creating deep horizontal lines in the forehead above and between the eyes. She does not laugh so violently that the flesh breaks up into ripples and eddies about the eyes. She makes her glowing eyes and her

smiling lips express all her thought and emotion. So did all the French beauties of old, which was the reason that Ninon L'Enclos and Mme. Recamier, in their extreme age, had lovers and no wrinkles.

The shrinking away of the muscles from the skin is a serious menace to beauty. Its causes are several. Perhaps a woman has reduced her flesh more suddenly than wisely. Perhaps the shrinkage has been caused by anæmia. The condition demands nourishment of the skin and of the muscles beneath the skin. But this is merely a local treatment. More than anything else it requires a rebuilding and rejuvenation of the entire system.

Knowing the causes we must avoid them. We must resolve to conceal if we cannot stop the ageing process. We must not, dare not, worry. We must never pass a certain point of fatigue, that point at which we are too tired to rest or sleep. Such a weariness is destructive. We must not make faces while we talk. Whatever our emotions we must try to keep our features serene as those of a mask. Leave to the mouth and eyes the task of expression. We must by nourishing both skin and muscles prevent their divorcing each other.

But granted that the wrinkles have appeared what shall we do to remove them? We must first remove the cause which has produced them. If two ugly parallel lines are discernible between the eyebrows we must correct that habit of scowling, whose footprints are ugliness. And we must avoid eye-strain. Often the lines in their beginning can be removed by giving up the habit of reading except by daylight, and then of not reading long continuously.

A young woman who, after much travel, noticed a light but ominous tracery of delicate lines on her face, said: "Heavens! I must take the rest cure, and buy cold cream by the pound!" She was right. Those first menacing wrinkles showed that she had not preserved the balance of vitality which assures perfect health. She had given out her strength faster than she renewed it. The outgo exceeded the inflow, which is merely over exertion, differently phrased. She went to bed and remained there for three days. In her darkened room sleep, the great ironer out of lines, aided by the generous and frequent applications of cold cream, removed her wrinkles. When she came forth from her rest cure her skin was smooth and as delicately flushed with pink as that of a healthy babe.

The cold cream which she had bought "by the pound" was one of the best to be obtained in the market or to be frugally made at home:

Spermaceti, ½ ounce; white wax, ½ ounce; oil of sweet almonds, 2 ounces; lanolin, 1 ounce; cocoanut oil, 1 ounce; tincture of benzoin, 12 drops; orange flower water, 1 ounce.

She might have used, as effectively, this which has an astringent quality, while the former is essentially a skin food:

Almond milk, 1½ ounces; rose water, 6 ounces; alum, 60 grains.

This relic of the customs of old France is another aid in the removal of crow's-feet or other paths of age:

Honey, 3 ounces; isinglass, 1½ ounces; pure vinegar, preferably that made from white wine, 1 pint; shredded red sandal wood, ½ dram.

A deliciously refreshing pomade classed with the wrinkle removers is composed of:

White wax, 30 grams; honey, 15 grams; juice of lily bulbs, 60 grams; rose water, 12 grams.

This is a liquid preparation which the beauties of the Austrian court named in their gratitude "The Water of Eternal Youth":

Pulverized sweet almonds, 48 grains; pulverized gum arabic, 32 grains; pulverized benzoin, 32 grains; pulverized olibanum incense, 32 grains; alcohol, 8 ounces; cloves finely ground, 16 grains.

The face should be washed with this as often as convenient, and the preparation can be applied by wetting freely bandages of cheese cloth or bolting cloth or old silk or muslin, tied about the chin or forehead.

Of course these must be applied by careful and skillful massage, the lines about the lips removed by a rotary motion of the second and third fingers of each hand, rubbing upward toward the nose. The lines about the eyes should be massaged in the same way, away from the corners of the eyes and toward the hair line. The lines between the brows should be ironed away by a pressure of the fingers between the brows and sweeping away above the eyebrows to the point where the eyebrows end. So for the horizontal lines of the brow the rotary motion of the first three fingers upward toward the hair. Afterward all this surface should be gone over carefully with the light, tapping motion which I have before described as being like the patter of rain.

The woman who has reduced her flesh rapidly may find the skin about the cheeks sagging into deep folds when she bends her head. These can be corrected by three methods, all of which I recommend to be used for that condition. First she must cultivate as a habit that poise of the head which is infinitely useful in removing a double chin. She must keep the chin and head tilted upward, the most graceful and becoming poise of the head for all women. She should massage the muscles with the first three fingers, following the muscles backward toward the lines of the ears. For the wee wrinkles that form in front of the ears massage with the second finger, in rotary motion, gently back toward the ear.

For obstinate wrinkles on the forehead adhesive plaster may be cut into strips and pasted across the wrinkled surface after the skin has been drawn taut into place by the thumb and forefinger.

A home remedy is a compress of old linen or muslin dipped into a mixture of the white of an egg and a gill of alcohol. Press the loose skin back into place as I have directed and apply the compress.

Dryness of the skin will cause wrinkles. To understand this study two rose leaves, one moist and full veined and nourished, the other drying and forming fine lines. The dry skin wrinkles sooner and deeper than the oily skin. Wrinkles are chiefly formed by the skin ceasing to fit well over the muscles which it protects. This may be because the muscles shrink or because the skin loses its firmness, or both.

Try to avoid wrinkles by keeping your face placid. The nervous person has more wrinkles and forms them earlier than the one of more self-controlled nature. Don't half close your eyes when you laugh. That habit causes wrinkles. Don't let your mouth droop when you are angry or troubled. That carves deep lines about your lips, making the dreaded parentheses. Don't wrinkle your brow when you talk or listen, to prove your veracity or interest. It is a habit that carves transverse lines on the brow.

When they begin to appear take more rest. Plenty of sleep is the greatest ironer out of wrinkles. Correct the bad habits that have caused them. Live simply. Nothing brings wrinkles sooner than dissipation and late hours.

When small, fine lines begin to appear, putting cold cream well into the affected area should help to drive them away. Ironing that portion of the face with small lumps of ice covered with cotton or gauze is a good remedy if you persist in it.

A method in general use in the beauty parlors of Paris, and that has been introduced recently in this country, is to spray the wrinkle area with cool or cold water. If you have not a wrinkle spray, a large perfume atomizer will serve the same end.

When your skin seems loose and inclined to form into folds use one of the following remedies:

Dip a bit of absorbent cotton into glycerine and pat it well into the wrinkle bed. Or apply cologne water in the same way. In a short time you can decide which is the better adapted to your skin. Glycerine, while a food and stimulant to some skins, is an irritant to others.

A nightly bath of the face in buttermilk sometimes tightens up the loosened skin.

This is a method much in use in Paris and Rome. Hundreds of years old, traced even to the time of Cleopatra, it is still effective, it is claimed, in keeping the countenance smooth and youthful. Heat a shovel red hot in the fire. Throw upon it when so heated a handful of powdered myrrh. Bend the face over it to receive the fumes, such fumes as can penetrate the napkin that has been spread over the face. Do this two or three times at the same treatment. Heating the shovel once more, pour white wine over it and, still through the moistened napkin which protects the face from the heat of the fire, receive the fumes in the face. A fortnight of two such treatments given daily is the recipe a woman whose face is smooth as a girl's, though this famous Parisienne is now sixty, gave me for my American readers.

A simpler remedy is to boil a small handful of pearl barley in half a pint of water until it is thoroughly cooked. Add a half dozen drops of mecca balsam. Place in a stone bottle and shake thoroughly before using. Bathe the face in this once a day.

These astringent lotions may also be applied with benefit:

Water, 1 quart; pearl barley, 2 handfuls. Boil until the barley grains are soft. Strain the liquor and add 50 drops of tincture of benzoin.

Wash the face, if possible, a dozen times a day with this:

Oil of rosemary, ½ ounce; oil of lavender, 2 drams; tincture of tolu, 4 drams; rosewater, 1 pint; rectified spirits of wine, 1½ pints; oil of petit grain, 30 drops.

Believe me, if the spirit remains young, the flesh will age but slowly. Contrive to keep interested in persons and conditions and circumstances. Don't let yourself be bored. Flee from bores or drive them from you.

When you are uninterested, your face grows heavy and opaque. It loses its reflective power, that mirror-like quality which is its chief charm. One of the wisest and most enchanting women I ever knew--truly a woman irresistible--told me she would never allow any one to see her in any but her sunniest mood.

"Meeting people is making pictures of one's self," she said. "Memory pictures that remain long, perhaps forever, in their minds. It is difficult, sometimes impossible, to remove that memory picture. They may see us in other moods and phases, but the ugly picture persists. If I am in an unbecoming mood, I hide until it is past, as I would hide did I suffer from an infectious disease."

That is true philosophy of charm. Be interested, be cheerful, be at your best when you are in public. If you cannot be these, hide from the sight of men and women until the eclipse of your charming self has passed. If you are a business and professional woman and cannot do so, at least hide the mood beneath an impassive face and behind the screen of a silent tongue.

Two extreme evidences of the approach of age are certain conditions of the head and feet. Don't let the lower part of your face grow heavy. That adds to the appearance of age. "Jowl-like" cheeks and a loose-hanging chin add years to apparent age. Prevent that defect, or, if it has appeared, correct it by great care.

Be vigilant as a worthy policeman. Be on the alert. Say to yourself, "Am I holding my head high? Am I giving the muscles of my chin exercise to keep them firm, or am I allowing the flesh to accumulate and form a bag about it?"

As many times a day as you can, and at least every morning and evening, give the neck and chin their stretching exercises. Raise the chin and let the head fall back upon the shoulders. Let it rest as far back as possible, and with the tips of the fingers press gently upward the muscles at the sides of the neck. Persuade those muscles. Train them. In time they will respond to the education you are giving them and grow firmer.

If, at the same time, you iron the falling muscles of the chin and neck with a piece of ice the process of rebuilding the lower part of the face will be quicker. But I have found very effective retiring with a piece of soft cloth, saturated in witch hazel, pressed about my neck. Witch hazel is an astringent and will draw the flaccid skin tighter.

No matter how tired you are, don't allow yourself to look tired. The tired lines and slipping downward muscles add greatly to your appearance of age. Control them. It can be done by an exercise of the will. Smile. Most women look better when smiling, and all, who have well kept teeth, look younger.

I said you must look to your feet. That is true. If you have worn shoes that give you a silly, mincing gait, buy larger ones and acquire a free, natural, springing walk. Don't drag your feet about as though they and your body had a weight you could scarcely bear. Lift your feet and walk with the fine spring and swing of youth. This, too, is a habit that can be formed even at an advanced age. Perhaps you have had the slow, heavy step of age from your childhood. Then it is high time to change it--if you would be young.

Study the faces about you and you will see that some of them are firm muscled, full and of even contour. In others you see that the muscles are sagging, slipping from place. The face is growing heavier about the chin and there is a drawn, strained look of the muscles about the eyes and temples. These are the fallen faces.

If you see that the muscles of your face are beginning to slip downward lose no time in counteracting this tendency to make the visage look older and heavier. Had I my choice between wrinkles and the regrettable fallen face I should choose the wrinkles as less ageing in appearance and more likely to be remedied.

First, reform your habits of sleeping. The posture in which we sleep determines into what lines the face and body fall for eight or nine hours of each twenty-four--a third or more of our time. If correct habits are formed for that time there is an admirable start on the road to better looks.

Notice how your head rests as you fall asleep. Perhaps it is bent far forward. In that case the facial muscles are relaxed and their tendency is to slip downward, tugging their weight, especially that of the large chin and cheek muscles, drawing them down throughout the night. All muscles relax while we are asleep. That is the reason why, on rising in the morning, the face looks heavy

and “pudgy.” The muscles do not recover their tone until the habits of the day reassert themselves.

With this knowledge you should be willing to make special effort and endure some inconvenience to prevent this slipping of the facial muscles at night. Toss away your pillow, or, if you are exceedingly uncomfortable without one, if the blood rushes to the head and causes you to be sleepless, use a small, flat pillow, or better still, slip such a pillow beneath the head of the mattress so that your body will rest at a slight incline, and the hair and scalp will be spared the heating of the pillow. Lie upon your back. In this posture your chin will be thrust upward and the muscles will be at tension. If you sleep thus the facial muscles will not sag during the night hours.

Study your habits during the day and correct such habits as cause a falling of the facial muscles. Perhaps you bend your head unnecessarily low over your work. If so avoid this. At any rate, give the chin muscles the opposite exercise by bending the head backward upon the shoulders many times a day.

Perhaps you have formed the habit picturesquely described as “talking into your chest.” This is an unbecoming mannerism of many women. Shyness or self-consciousness or listlessness may be the cause in some instances. In others it is sheer bodily laziness. Don’t let your chin sink upon your chest when you talk, nor at any other time. It makes a very unpleasant impression upon the hearer. It gives him the idea that you are secretive or deceitful. Lift your head when you talk, and look into the face of the person you are addressing. He or she will admire you more. Besides it is another means of preventing the slipping of the facial muscles, of keeping your face from falling.

We go back to nature for inspiration for beauty. Some of the most graceful of the modern dancers are self-taught and nature-taught, taking for models of grace the swaying of the tree boughs and the lilt of flowers in a wind. So we can go back to nature for models in the poise of the head. Take for an example, not some tired dray horse who lets his discouraged muscles sink beneath his forelegs, but the inquisitive bird, with head uplifted and upturned eyes seeking to solve the mystery of the trees.

Coax the muscles of the chin and neck into obedience. Beginning at the point where the muscles of the neck meet those of the shoulders, press firmly with the fingers of both hands, moving the hands upward to the muscles of the lower jaw and continuing the pressure on the muscles behind the ears.

Is your neck beginning to look old? Is the skin growing flabby? Are the muscles sagging? Is the skin looking yellow? Is it no longer a source of pride and pleasure to wear a V-shaped or low cut gown?

Do not despair, for the ageing neck is not an infallible sign of growing old. It is only one of them. And you have my assurance that you can make it look youthful again. For proof of this let me point you to the great singing teachers, yes, and the great singers who are their pupils. Almost every one of them--indeed, I can think of no exception--has a round, white, youthful-looking throat. One of the most beautiful necks I ever saw, white, strong, girlish, was that of the celebrated vocal teacher, Mme. Marchesi, when she was seventy.

But while this is true, it is also true that you should begin giving the neck special attention before you are thirty. It were better if you began when you were twenty-five.

First, look to its careful feeding. Give it at least one good meal a day by rubbing cold cream liberally into the front of the neck at night before retiring.

Look very carefully to the poise of the head. If the head be held proudly, the chin up, the muscles of the neck will also be held firm. But if you permit the head to droop the neck muscles share the sagging.

Never lie with the head high. One small pillow is enough for anyone, except the insomniac. If you can dispense with the small, flat pillow and lie with the head and feet on a level, so much the better for the neck.

The neck thus trained, and with the additional training of deep breathing, learned by vocal lessons, should never grow old. I advise every woman to take vocal culture for herself, even though she have no liking for music, simply for the sake of the beauty of her neck. The most beautiful necks in the world are those of singers.

But if these preventive measures have been neglected and the neck is losing its roundness and its firm aspect, have recourse to that great body builder, massage. There is special massage for the neck, and it must be intelligently given.

First strengthen the chin muscles by pressing firmly upon them with the backs of the hands. Turn the hands, with the backs upward, and letting the finger tips meet beneath the middle of the chin. Press with all your strength on the muscles of the chin, working backward and upward behind the ears to the hair line.

Second. With the tips of the fingers quite meeting at the point of the collar bone in front, draw the hands with long, slow strokes upward to a point beneath the ears. This is a good muscle building movement.

Third. Slap the neck smartly with the palms.

Fourth. “Lift” the tendons at the side of the neck that are inclined to grow more prominent and ropey each year. This lifting consists in seizing the tendons in a firm grasp and seeming to raise them to meet the head. This is painful, and may even cause a slight headache at first, but these are only Nature’s protests against the unaccustomed. Even Nature is an old fogey about innovations.

Fifth. Grasp the large muscles at the back of the neck and connecting the shoulders, and “lift” these also. Raise them as though it were your purpose to place them in the curve of the neck. This should be followed by a vigorous kneading of the muscles.

The aim of all these massage movements is to promote circulation in the neck. The yellowish, withered-looking skin denotes that the blood flows weakly in that part of the body. The flabby muscles indicate that the muscles have not been well exercised. A good developing exercise for the neck is to let the head lie back as far as possible on the shoulders, then roll slowly from one shoulder to the other.

The hands should be immersed in nourishing cold cream before “feeding” the throat muscles. This is a formula for a nutritious cream:

Almond oil, 1½ ounces; lanolin, ½ ounce; spermaceti, ½ ounce; witch hazel, ½ ounce; tincture of benzoin, ½ dram.

Ninon de L’Enclos, one of the greatest beauties of French history, had a beautiful neck, and to her is accredited the use of this neck food:

Rosewater, 8 ounces; almond oil, 8 ounces; tincture of benzoin, ¼ ounce; attar of rose, 5 drops.

This will be quite as efficacious and much less expensive without the attar of rose.

The following nourishes and whitens the skin of the neck:

Honey, 1 tablespoonful; lemon juice, 1 teaspoonful; whites of two eggs; enough bran or almond meal to make a fine paste.

This wash is also a good neck bleach, particularly useful in removing the dark stains or rings caused by wearing the prevalent gilt and silver trimmings about the throat:

Hydrochloric acid, ¼ ounce; water, 5 ounces.

Avoid high, tight collars. Wear soft white silk and muslin linings next the throat for colored collars. If it is necessary to wear costumes with high collars on the street, change them at once for collarless gowns when you are at home. If you wear chains or dog collars about the neck let them be loose.

A famous theatrical manager whose duty it had been to select thousands of beauties for the choruses of his productions, and who was a celebrated connoisseur of feminine beauty said that a neck to be beautiful must look as though it “belonged” to the body, that is, to use theatrical parlance, it must “be in the picture.” A long neck on a short woman is absurd, and a short neck on a tall woman makes her look like a freak of nature. If a girl is slender her neck should be slim, but she should take measures to prevent its being “scrawny.” If a neck is full and round, to correspond with the body of the owner, it is as nature designed it to be. A full, well rounded neck is not only beautiful in itself, but it is a sign of abundant vitality. The same theatrical manager I have before quoted said he cared not how thin a neck was if it matched the body and was well “covered.” He meant if the outlines of the bones and sinews were well hidden by a delicate covering of flesh. Usually if the neck is very thin the entire body is also, and measures should be taken to upbuild the constitution. Eating nourishing food, breathing deeply and giving the body plenty of rest, should fill out the hollows in the neck as well as the body.

This process can be hastened by patting into it nightly an emollient made of equal parts of almond oil and vaseline. Also the neck muscles can be strengthened by placing upon the head now and then a moderate weight, as a book, and walking slowly about the

room, balancing the book by so steadying the head that the book will not fall. If the neck be disproportionately fat gentle pinching between the thumb and first three fingers should reduce its bulk.

CHAPTER XIX

HOW TO TRAIN YOUR CHILDREN TO BE BEAUTIFUL

It is possible to train a child to beauty and this training consists of two means. One is to teach the little one habits of personal daintiness. The other is to impress upon him or her while very young, the principles of health.

A third is to correct any defects by early attention to them on your own part if you are parent, guardian or teacher.

For instance there is the child whose beauty may be marred by outstanding ears. The ears can be pressed back against the head by a compress made at home and worn at night. A bandage easily made in the house consists of a long, folded strip of strong muslin, twisted first around the head beneath the chin, then around the neck, then over the crown of the head, the ends of the strips of muslin being drawn rather tightly over the ears and fastened to one of the lengthwise strips by safety pins.

If you find the child often breathing with difficulty he probably suffers from that growth at the back of the nostrils called adenoids. Take him to a physician and have them removed, so preventing a long train of disasters, mental and physical, whose signs are that strained, drooping countenance we know as an adenoid face. Don't let any charlatan try to convince you that they can be cured in any other way. The single way to remove adenoids is by a surgical operation.

Look to the fact that the child's teeth have a good start. A little watchfulness will cause the first set to be drawn in good time for the second to come in straight and strong. Then teach the little one to take pride in their whiteness. Furnish a pure, fresh powder or paste, or let her use a powder for one cleansing and a paste for the next, and so on, alternating. Teach her to brush the teeth up and down, not across, and to brush them inside as well as out, and along the crowns. Help her to form the habit of always rinsing her mouth with warm water, or with warm salt water, if there be an acid tendency of the mouth, after each meal. Teach her that the mouth must always be rinsed with water into which a pinch of borax or of bicarbonate of soda has been dropped, after eating either fruits, which are acid, or candy, which soon resolves itself into acids.

Teach her that it is as necessary to be pure of mouth as of speech. Train her to be proud of clean nails and to be ashamed of gray or black rimmed ones. Teach her early to trim her nails and to keep them spotless, and keep the cuticle pressed back from them. Teach them that soiled hands are a disgrace to a little girl and offensive in a little boy.

Appealing to the pardonable vanity that is in little children, teach all that much of the expression of the face depends upon the arch and smoothness of the eyebrows, and show them how to train them by twice daily brushings.

Teach her to watch the dainty movements of her pet canary and her favorite kitten and emulate their table manners. Birds handle their food delicately, and kittens seldom fill their mouths overfull. The little girl will want to be as fine as her pets, and unconsciously will develop pretty table manners.

Teach him not to be afraid of fresh air. Teach him the contrary by telling him the story of "The Black Hole of Calcutta" and of the beautiful boy who was gilded to head a procession and who died after his brief glory because his pores had been closed by the gaudy stuff with which he was bedecked. Bogie stories are permissible if they frighten children into care of their health by leaving their windows open two or three inches at night and by wearing their clothes loose.

Don't let the children in your charge study to the point of eyestrain. Teach them to use the ears to save the eyes. Let them learn by listening. It was prophesied by a writer on health that in time the phonograph that now grinds out rag time airs to the lessening of the standard of popular taste will have records which tell the classic short stories of biography, fiction and history. Don't allow a child to overstudy. Better a well-developed, rosy-cheeked little one who knows no Latin nor higher mathematics than a squinty, anæmic who knows both, but who doesn't know the way in the woods to the woodchuck's hole nor how to defend himself in a schoolboy fight.

Teach them to love the life in the open. If you live all year in the crowded city, the roofs, at least, are available to you. And in some part of your home, even though small, you can put up a crude gymnasium. For instance, a horizontal bar, with a mattress drawn under it for precaution, will give the little ones great fun, besides being a developing agent.

Break the children’s unpleasant facial habits in the forming. Show a little girl how ugly and old she looks by flashing a mirror before her eyes while she is frowning. Show her that the frown of concentration is as ugly as the frown of anger and train her to solve a problem with smooth brows. If she twists her mouth unpleasantly when she talks, tell her of it, and if that doesn’t cure her, call the mirror to your aid.

CHAPTER XX

ADVICE TO BLONDES AND BRUNETTES

Six subjects are of special consideration to the blonde. She must remember that her type has the most delicate of complexions. To accentuate her blondness she should keep her hair as light as possible. She should eat such food as will enrich her golden coloring. She should avoid whatever tends to the accumulation of fat. She should guard against the faded appearance that comes early to most blondes. She should dress to emphasize her golden coloring.

While it is true that woman’s hair is her crowning glory, a blonde’s hair is her aureole, her halo of beauty.

Half the time and attention she gives to her toilet should be given to her hair. The blonde’s hair, as a rule, has a golden tint. This tint is the keynote of her beauty, and should be enhanced in every possible way.

She may wash her hair as often as she likes with no fear of its fading. The lighter it becomes the better. For her there need be no fear of using carefully those aids in cleansing the hair, ammonia, borax or washing soda. Each of these, if used often, tends to make the hair several shades lighter--but in too large quantities it will make the hair brittle.

Because it does not matter how light her hair becomes, the blonde may wash her hair oftener than the brunette does. A shampoo in borax water once or twice a week soon lightens the hair. One tablespoonful of borax in a gallon of water is sufficient.

Two shampoos a week in water in which ammonia has been sprinkled soon brings about a lightening of the hair. One gallon of water and half a wineglass of ammonia is a good proportion.

Two shampoos a week in a gallon of warm water with a heaping tablespoonful of washing soda in it is the speediest agent I know for lightening the hair, excepting peroxide, which some blondes who do not wish to actually bleach their hair use in small proportions in the shampoo. One tablespoonful of peroxide of hydrogen in a gallon of water is the usual proportion.

Every one expects light hair to be fluffy. Fluffiness is the accompaniment of goldenness in hair, and the observer of beauty is always disappointed if he sees fair hair smooth. Smoothness seems to belong rather to dark hair. The blonde should so comb and brush her hair that each hair is distinct and separate from the others. This gives an aureole-like effect to her face, and wonderfully softens her features.

The blonde knows that fair hair is expected to be fluffy. If it isn’t she can make it so by drawing it into a loose mass after a shampoo and tying it with a ribbon, letting it dry thus. If the hair is long it can be tied again by another ribbon close to the ends, making it curve or wave.

The blonde’s skin being finer and more delicate has a greater tendency to wrinkle. Wrinkles come early to her because her skin is so delicate. It is like rice paper, forming fine surface wrinkles as well as deeper ones. For this reason her motto should be “Oil, oil, oil.”

The blonde’s complexion is comparable to that of a rose. It has a superb bloom, but fades early. The withered rose petal is one of the most pathetic sights in nature. It is a danger signal to the blonde, saying sadly to her, “Guard well your complexion!”

The blonde should remember that the dry skin is the forerunner of wrinkles, and literally keep her skin well oiled. Occasionally a blonde, if stout, is troubled by a greasy skin. This old cosmetic has corrected that fault:

Sulphate of zinc, 2 grains; compound tincture of lavender, 8 minims; distilled water, 1 ounce.

This cream is of the soft sort that is especially adapted to a blonde’s delicate complexion:

Oil of sweet almonds, ½ ounce; olive oil, ½ ounce; oil of poppies, ½ ounce; white wax, ½ ounce; spermaceti, ½ ounce. First melt the white wax over a slow fire, pour in the other ingredients, and stir briskly until they cool and reach a cream-like consistency.

For a skin that is chronically dry, I recommend the use of almond meal instead of soap. It is not only cleansing, but injects into the pores the needed oil. I also advise frequent use of this:

Almond oil, 2 ounces; extract of Italian pink, 12 drops.

Many blondes when they are young are afflicted with unbecoming flushing of the skin. Sunburn and wind roughening are an affliction to the owners of such complexions. For these the compounds containing a generous amount of honey are healing and soothing. The following I have always heard recommended as efficacious by many blonde friends:

Honey, 1 ounce; almond oil, 1 ounce; white wax, 1 ounce; spermaceti, 1 ounce.

Now and then a complexion rebels against glycerine. This is more liable to be true of blondes, although I recall at this moment six at least who use the following to tone down the redness when their skin has been irritated:

Camphor water, 1 pint; glycerine, ½ ounce; powdered borax, ¼ ounce.

As her skin is more delicate, so the facial massage should be lighter than that given the brunette. It should indeed be the new massage, the patting, the raindrop sort of treatment, instead of the severe treatment of the old régime.

Always with a view to keeping and enhancing the golden tints in hair and skin, the blonde should be careful to eat such food as will feed the pigment that produces the wheat-like hair and apple blossom skin.

I have before spoken of Mme. de Crequy, the French beauty, who was in many respects a model to the other beauties of the court of France. Her biographers said that Mme. de Crequy had the loveliest complexion ever granted to woman. They said in the next line that she ate every day thirty oranges and almost nothing else.

The orange is the best friend of the complexion among the fruits. It clears the complexion marvelously, but it has besides the property of holding much of the golden shade in solution. A blonde whom I know tried the experiment of eating a half dozen oranges a day and increasing the number to a dozen daily for three months. In that time the change in her coloring was marvelously for the better. Her hair, which had been a shade too pale, took on the rich yellow of cornsilk.

When she had quite convinced herself of the fact that oranges are the food of beauty, and especially of blonde beauty, she was advised also to eat many carrots. This she did in connection with the oranges for six months. She ate carrots sliced and stewed in cream. She ate them in soup. She ate them mashed and seasoned slightly with salt and pepper. She even ate them baked. This she began doing in the early summer. By the same time the next year her hair had deepened three shades and was far richer. And her complexion was fresher, fairer and it harmonized more perfectly with the golden lights in her hair.

The blonde, as a rule, must fight the tendency to accumulate flesh. The man who first wrote “fair, fat and forty” was observant. He had registered the conclusion that the woman who is fair is at forty more than likely to be fat. And so she is. Recognizing this tendency of the placid nature, which is usually an accompaniment of fair face and hair, the blonde should begin to combat it at twenty. Better at eighteen.

She can prevent her waist and hips growing larger by deep massage. The Japanese women never grow fat. Ask them why and they show you how they pinch their hips to crush the tissues and keep the hips flat.

Your funny American dance, the cakewalk, is a great hip-reducer. That backward motion, with the face turned upward and the feet lifted prancingly, draws the tendons, solidifies the muscles and makes the limbs compact.

To reduce the hips, with hands on hips bend forward, swaying the upper body in a half-circle on a horizontal plane.

Stand erect and try to make the elbows meet in the back. This is an excellent exercise to remove the superfluous fat or to prevent superfluous fat forming upon the back.

To make the waist small and pliant stretch the arms high above the head and bend them forward, describing a quarter circle.

To reduce the abdomen, bend forward until the palms touch the floor.

To avoid growing stoutness lie upon the back and raise the body slowly to a sitting posture without bending the knees.

These exercises alone, begun early and persisted in, will keep back the tide of fat that comes with the years to most blondes.

She should guard, I have said, against the early fading that is the blighting tendency of her type. It is nature's compensation, a revenge nature seems to work at the behest of the jealous brunettes, that the blonde who was so exquisite in youth should early lose the delicacy of her skin and the brilliancy of her hair. But some blondes have prevented this early fading, and what some blondes have done other blondes may do. The cure in this instance is the preventive. The delicate skin that has been well fed will not grow dry and wrinkled early. The blonde who has made carrots and oranges her chief articles of diet for many years, supplying the iron needed to replenish the rich gold of her hair, will not early lose the luster of that hair.

The blonde's critics say that she should wear gown, hat, shoes and gloves to match, but that she should wear only one color. Perhaps this is untrue, but I have noticed that many of them are disposed to heap color upon color upon their costumes. Violet and green and mauve and black I have seen in one combination. The blonde who wore it looked cheap and common, and the glory of her hair was dulled by it. Had she worn any one of the colors alone, been a symphony in violet, in mauve, in green or in gold, she would have been ravishing. And the splendor of her hair would have been a glory in burnished gold. But she diffused her color effects by her strange costume. Blondes should always dress for their hair.

A rude bachelor said that "blonde" had come to be a term of contempt because there were so few natural ones. Scientists, too, say that her type is decadent and will in the course of a few hundred centuries disappear. But the blonde can enjoy herself for many generations before that happens. And she may remember that the blonde races have been the world rulers for many years.

The history of the evolution of the blonde shows that her origin was in the north, but that she emigrated to the south and ruled the brunette natives. Science gravely informs us that the blonde flourishes in the moistest climates. This great racial fact may be applied to individual cases. Certainly the blonde who wants to cherish her golden hair and fair skin should not turn inland, but to the seashore.

If you are a brunette your glory is your eyes, your menace is your liver, your besetting fault is a lack of cheerfulness.

As to your eyes first. Their color is in itself a guarantee of beauty. There is no shade of brown eyes that is not beautiful, beginning with the golden brown eyes, which the novelists delight to describe as tawny but which I have named tiger color, through the red brown shades--that to some imaginative ones suggest cruelty, to myself the brownish red shades of claret--to the so-called "black" eyes, which are indeed not black, for there are no genuinely black eyes. Place a bit of black velvet beside the darkest eyes you ever saw and note how brown the eyes look beside them.

They run the gamut of beauty. Brown eyes, the shade of the tobacco leaf, Fierenzuola, the Florentine authority on beauty, said are the loveliest eyes in the world. Certainly they are the eyes of sentiment, and sentiment is accepted even in America, though it has not here the importance in individual and national life that it has in Europe.

I have read somewhere that brown eyes ask for love and get it. The eyes of the brunette should shine starlike out of a creamy white face as stars peep through the breaks in a cloud.

The eyes being her glory, the wise brunette takes the best possible care of them. To care well for them she should care well for their surroundings. Eyes are of diminished loveliness indeed if the eyelashes and eyebrows be ill kept. The eyelashes should be thick and soft as silk. They should be long and their loveliness is still greater if they happen to be curly. To keep them in best condition there should be no eyestrain. Reading by a bad light, reading on a moving vehicle, reading in bed, looking at too great distances, or looking too continuously at too bright objects in the sun-light--as at an unshaded lake at high noon or a bit of glass in a high light, continuing at any task after the muscles of the eyes ache, cause eyestrain, and eyestrain causes inflammation of the eye itself, of the linings of the eyelids and of the rims of the eyelids.

Whatever inflames the lining of the eyes inflames the edges of the lids, and from inflamed eyelids the eyelashes fall with alarming swiftness.

Trimming the ends of the eyelashes once in six weeks I find makes them grow longer and thicker. I always have this done by a young person, because a young person's hand is firmer, and there must be no trembling of the hand that works in the region of the sensitive eye. Use one of the tiny brushes made for eyebrows and eyelashes. Use it every morning and evening. Brush the eyelashes lightly with a downward stroke to make them long, upward to make them curly. Both serve the chief purpose in the culture of eyelashes, which is to keep them clean. You are most careful to keep your velvet gown free from dust. Be careful also of your eyelashes, which are more vitally important to your beauty.

For bathing the eyes to relieve them of inflammation and so to strengthen the eyelashes use this preparation:

Distilled water, 1 pint; cornflowers, 30 grams. Crush the cornflowers in a mortar. Steep them in the water for a day--that is, for twenty-four hours. Strain the liquor through a piece of fine cloth, such as cheesecloth. Heat in a porcelain pan over a moderate fire. Cool and tightly cork. Bathe the eyes night and morning from an eyecup or with an eyedropper.

Spanish women whose eyelashes have faded often apply this mixture to make them darker:

Water, 300 grams; sulphate of iron, 10 grams; gall nuts, 50 grams.

Boil the nuts in the water for a half hour. Strain through cheesecloth or muslin. Add the sulphate of iron. Boil again until the quantity of the liquor is reduced one third. Apply at the root of the eyelashes, being careful not to let any of the mixture touch the eye. The best means of applying it is with a sable pencil. This formula may also be used for the eyebrows.

Brush the eyebrows night and morning, training them to a high arch. The expression of the face is more piquant if the eyebrows be high.

The brunette, even more than the blonde, should develop by every proper means the brilliancy of her eyes, for while the brunette's chief glory is her eyes, that of the blonde is her hair.

She should, besides taking all the rest she needs--even more than she needs so that she will be sure to have enough--use many cooling lotions. The boracic acid water which I have recommended for the blonde I forbid to the brunette, because it often leaves a sediment which clings to the eyelashes and shows white as hoar frost on the black lashes of the brunette. But for her there is the refreshing eyebath of cool, weak tea, or of this, applied fairly warm:

Rose water, 1 gill; witch hazel, 1 gill.

If the eyes ache persistently, retire to a dark room, lie down and place upon the eyes some cool tea leaves, secured there by the useful eye bandage or bandalette to which I have referred in a previous chapter.

If crow's-feet appear prematurely about her eyes she should apply lanolin, patting it in thoroughly. Lanolin is the base of most of the skin foods and has no equal, to my present knowledge, as a builder of flesh tissues.

The blonde's complexion fades early because her skin is extraordinarily thin and fine. The brunette's, as a rule, is the reverse. A fine almond meal is a good substitute for soap for the blonde's complexion.

The brunette, because her skin is thicker, and has a tendency to an oily appearance, could to her benefit use once a day a toilet soap made as follows:

White castile soap, 300 grams; spermaceti, 20 grams; oxgall, 10 grams; honey, 20 grams; essence of rosemary, 10 grams; essential oil of oranges, 15 grams; oil of lemon, 20 grams; alcohol, 15 grams; attar of roses, 2 drops.

Melt the spermaceti and the shaven soap in a bain marie. Add the other ingredients one by one, mixing thoroughly after each addition. Pour into molds.

If the brunette finds that the pure, cold creams contain so much oil and lanolin that they encourage the natural oil in her skin, she can feed her skin with slighter nourishment, as for instance some of the cucumber lotions that have from time to time appeared in the articles I have written. This can be prepared at home. Wash and wipe carefully six large cucumbers; leave the rind on and cut the cucumber into inch square cubes. Fill one saucepan with water, and into a small one place twelve ounces of almond oil. Drop the pieces of cucumber into the oil and heat until they reach the boiling point. When it has reached that point put it at the back of the stove and let it simmer for three or four hours. Strain through cheesecloth, crushing out of the cucumbers as much juice as possible. Stir in while it cools four ounces of benzoin. Keep the liquid in a jar in a cool place.

I had not thought there was a brunette who did not know that when she dabs powder on her face in the evening she should choose not white but Rachel, the brunette shade which has a tint of yellow in it. But I have seen brunettes go forth to conquest with their face so white as to make them seem ghastly and repulsive.

Some of my blonde friends in Paris were washing their hair every other week in light ale. They thought this was a tonic for the scalp, and that it made the hair light. My brunette friends, on the contrary, use diluted claret:

Claret, 1 pint; water, 1 pint.

They believe that this helps to keep their hair dark. Prof. Jocquet, my hair specialist in Paris--and by the way there is none better anywhere--cleansed my scalp last summer in lemon juice.

Juice of two lemons; almond oil, 5 drops.

It is Prof. Jocquet's interesting theory that oil applied directly to the scalp causes the pores to open and disgorge the hairs.

The brunette should look, for a model for her hair, to the luster of black satin. It seems to be the scheme of nature that the brunette should have straight, shiny hair, as it is that the blonde should have crisp, curling hair. Often individuals stray from this plan, but there is no doubt that the plan exists.

I have said that the menace to her brunette beauty is the liver. I repeat it. In the brunette there is always, as an accompaniment of dark pigment, a torpidly inclined liver. That lazy liver, if permitted, will make her complexion muddy, her eyes dull, her movements sluggish. She must stir up this languid organ, make it perform its functions. As the blonde must fear an excess of fat, so the brunette has reason to fear an excess of bile. She should eat such juicy, acid fruit, as cherries, strawberries and grapes, and in the water she drinks it is well to add the juice of half a lemon to every glass of water.

The brunette should regard the lemon as her friend. It is a tonic for her stomach and her scalp. Half a lemon rubbed well upon the scalp cleanses it.

Her temperamental tendency is toward "the blues." A blonde is more sanguine than a brunette. The brunette will correct her brown view of life by the same exercise and diet that goads the liver into activity.

CHAPTER XXI

SURE AIDS TO BEAUTY

To give all the beauty recipes I have tested and can personally recommend would require three or four volumes as large as this. There are many helpful ones which I have been unable to find room for in the chapters where they rightly belong. So I am going to group here in this last chapter a number of "Sure Aids to Beauty" which I feel confident every sensible woman will be glad to know.

Among the recipes and bits of advice which I can least afford to miss the opportunity of passing on to other women are many which have to do with the hair. The woman who wants to wear her hair parted, but finds this manner unbecoming because the roots of the hair are darker than the ends, will welcome this treatment:

Shampoo at least once a week. Use the juice of two lemons in a quart of water for the shampoo. Occasionally substitute for the lemon juice a tablespoonful of ammonia. Rub this well into the roots when washing the hair.

The best way to make dead brown hair rich and glossy is to upbuild one's general health. The hair and teeth are fairly safe barometers of the vitality. Abundant, glossy hair is usually the index of perfect health. Take the tonics of plenty of fresh air, of exercise out of doors, of simple, nourishing food, and your hair will share your vigor. Much brushing should make it more lustrous. To darken it some brunettes wash it in this:

Claret, 1 quart; sulphate of iron, ■ ounce.

No one could ask for a more satisfactory shampoo than the following: Water, one cupful; one egg; tincture of green soap, 1 teaspoonful; cologne, 1 teaspoonful. Mix thoroughly and rub well into the scalp.

A simple and harmless hair dye that has been vouched for by honest folk is the water in which potato parings have been boiled. Walnut stain, prepared in the same way, is uninjurious. Experiment until you have secured the right shade. But I would advise stimulating the hair by massaging the scalp every day and by vigorous brushing.

To get rid of dandruff without making your hair either oily or dry, first give the scalp frequent shampoos. Every other day, or even daily, is not too often, for a week or two, if the case be an obstinate one. After shampooing and on other nights rub carefully into the scalp a tablespoonful or more of the following:

Bay rum, 2½ ounces; olive oil, ½ ounce; tincture of cantharides, ½ ounce.

Sometimes after a serious illness like typhoid fever one's scalp becomes very dry. For such a condition massage well into the roots every morning and evening the following:

Oil of sweet almonds, 45 grams; essence of rosemary, 45 grams; oil of mace, 2 grams.

Brown hair that is becoming streaked with gray may be darkened with henna water. One handful of henna to a quart of water is the right proportion. Boil down until there is only a pint of liquid.

The best method of shampooing the hair is, in my opinion, to rub two or three handfuls, or as much as is needed, through the hair and upon the scalp. Draw the long ends of the hair together to the top of the scalp and lather well about the neck. Massage the hair well with the soap. Then pour upon the head pitcher after pitcher of warm water, or play upon it with the bath spray. Gradually reduce the temperature of the water until it is cool, though never cold. Cold water causes a shock to the scalp that is detrimental to the nerves.

I have told of the simplest shampoo I know. For brunettes who wish to preserve the glossy duskiness of their hair, this is beneficial:

Rum or red wine, 1 wineglassful; yolk of one egg.

There is no arbitrary usage in the matter of singeing the ends of the hair. When the ends are split singe them. There is no need at any other time. But I have noticed that the need is liable to occur in my hair about once in two months. The singeing should always precede the shampoo, for the odor of burnt hair is not a desirable fragrance.

One word more concerning the hair. Be scrupulous about your brushes. If necessary dip them into a bowlful of lather made of white castile soap every day after the morning brushing. A half dozen drops of ammonia in the water will help to cleanse them. Rinse them thoroughly, so that no particle of the soap remains.

I have said that the scalp must be kept cool. Brushing helps to preserve this condition. I have known girls, who came home tired after a day at business, to wrap a few bits of ice in a towel and place it upon the flushed and burning scalp, feverish from a day of intense mental activity. This soon cools the scalp, relieves the congestion in the head and sends the blood dashing back toward other centers. Massage also relieves the congestion.

Avoid a dry scalp as much as you do a hot one. Indeed, the dryness is the effect of the heat. This can be corrected by massage. Lotions containing oil are many. If the triweekly massage fails to release the oil from the sebaceous glands there may be a few applications of this:

Castor oil, 2 ounces; alcohol (95 per cent.), 1½ pints; oil of bergamot, 10 drops.

If you insist on using a dye to hide the approaching gray hairs, I recommend the time-honored walnut stain, made as follows:

Walnut bark, 1 ounce; alum, ½ ounce; water, 1 pint. Boil the bark in the water for an hour. Add the alum to "set" the color. Apply the liquid with a sponge or bit of cotton. Wrap an old veil about the head or wear a night cap after the application, on retiring, else the stain will perform its functions on the bed linen as well as your hair.

I would much rather recommend your massaging the scalp vigorously and using one of these applications to retard the appearance of gray hair, for I believe in tonics, but not in hair dyes:

Bay rum, 2 ounces; sulphur, ½, ounce. Wash the hair and the roots in the liquid. Sulphur is a well known agent in retarding grayness of hair.

Brown hair that is fading into gray is freshened by this wash:

Claret, 3 ounces; sulphate of iron, ½ dram. Let the iron dissolve thoroughly in the wine. Wash the hair as frequently as necessary in it.

Persian women who want black hair apply a paste of henna to the hair, leaving it on a half hour or more. They then wash this off and apply a paste of indigo, leaving it on at least three times as long. When this is washed off they oil the hair, usually with perfumed olive oil. A simpler method is to mix three parts of indigo with one part of henna, adding enough water to make a paste. The longer it is on the hair the darker it grows.

Camphorated chalk is cleansing for the teeth and tonic for the gums, but I do not advise using it too often. Once a day, and that at night, is often enough to use tooth powder, for there are few powders that do not more or less wear the surface of the enamel, as constant grinding wears away what is much harder than teeth, a stone. Powders are objectionable in one respect. If strong, they cause the lips to pucker and dry unbecomingly. Instead of using powder so often, rinse the mouth often with strong salt water, especially after a meal, and brush the teeth with a brush dipped into salt water, or with water in which a pinch of bicarbonate of soda has been dissolved.

When the teeth are in fairly good condition this simple powder is sufficient:

Precipitated chalk, 5 ounces; powdered orris root, 3 ounces; camphor gum, 1 ounce.

This is a tonic to teeth and gums:

Magnesia, 2 ounces; powdered orris root, 1 ounce; bicarbonate of soda, ½ ounce; ground cloves, 5 drams; green anise seed powder, 5 drams; powdered charcoal, 4 drams.

This is one of the strongest of tooth powders and should be used only occasionally and in extreme cases:

Precipitate of chalk, 3 ounces; crushed cuttle fish bone, 3 ounces; powdered orris root, 2 ounces; myrrh, 2 ounces; burnt hartshorn, 2 ounces.

This is a remedy for receding gums, and for those that are sensitive and addicted to bleeding:

Sugar of milk, 3 ounces; tannic acid, 3 drams; red lake, 1 dram; oil of anise seed, 8 drops; oil of mint, 8 drops; oil of neroli, 5 drops.

Salt water, strong and warm, is an excellent mouth bath. So is bicarbonate of soda in a one part to three solution. This is the famous Eau de Botot:

Alcohol, 1¾ quarts; anise seed, 100 grams; ground cinnamon, 35 grams; ground cloves, 32 grams; essence of mint, 20 grams; cochineal, 10 grams; quinquina, 10 grams.

This is a mouth wash easily prepared at home:

Water (filtered if possible), 1 quart; alcohol, 1 pint; salicylic acid, 7½ drams; oil of peppermint, 15 grains; orange flower water, 15 grains.

This myrrh lotion is one of the best for the mouth:

Orange flower water, 5 ounces; tincture of myrrh, 3 grams; pulverized gum arabic, 2½ drams; pulverized gum mastic, 2 drams; balsam of Peru, ½ dram.

A red spot on the white of the eye is a sign of inflammation and that indicates some strain of the eye. First remove the strain. Give the eyes all the rest possible. Sleep more than usual. Give up sewing and reading for a time. Take a midday nap if you can. If not close the eyes as often as circumstances will permit for a few seconds at a time. Keep them closed while on a train. Study how to get the best light you can on your task. Avoid the direct light upon the eye. Bathe the eyes with an eyecup in a mixture of boric acid, 1 ounce; rose water, 6 ounces.

Keep cool bandages as cold tea leaves or finely cracked ice on the eyes. Rest, rest, rest, the eyes. If a few weeks of this care does not clear the spot from the eye consult an oculist for the trouble may be a deepseated one.

You cannot change the color of your eyes, but you can accentuate their color by taking especial care of your eyebrows and eyelashes, so that they will grow longer and thicker and lend their shadows to the eyes. Brush them every night and morning with an eyebrow brush to keep them free from dust. The brush may be dipped into lanolin at night. There will be plenty of time for the lanolin to be absorbed by the skin during the night.

Since I advise against hair dyes I can not conscientiously advocate dyeing the eyebrows and eyelashes. To massage lanolin into the eyebrows and touch the edges of the eyelids with the same may in time cause the growth of new hair. As it comes in it may be a trifle darker. That is the only experiment I advise.

Eyebrows that look uneven and “scraggly” should be treated every night with an eyebrow brush dipped in this mixture:

Olive oil, 1 ounce; tincture of cantharides, ½ dram; oil of nutmeg, ¼ ounce; oil of rosemary, ¼ ounce.

If by any accident the lids have become granular, as may have chanced to be the result of excessive golf, or excessive automobiling, the wholesome girl does not permit the disorder to grow. She knows that rest is to some extent corrective of the evil. If this does not quickly remove it I advise seeing a physician at once. I cannot conscientiously recommend any lotion for a disorder so serious and disfiguring. A physician's advice is necessary.

For heavy, flabby, soft eyelids, which will wrinkle early into a prematurely aged appearance, the wholesome girl seeks first the extra sleep and rest that are the greatest tissue repairers. To gently assist nature in the work of rejuvenation she may resort to this ointment:

Fresh lard, 150 grains; sulphate of potash of aluminum, 25 grains; tannin, 10 grains; borax, 20 grains.

If her eyes be inflamed and extra amount of rest does not banish the unlovely condition she may supplement the rest with this applied--from three to five drops--by an eye-dropper:

Distilled water, 50 grams; quince seed mucilage, 5 grams; water of cherry laurel, 3 grams; borax, ½ gram. This is recommended to be used with three times the quantity of water by the famous Dr. Vaucaire.

Another French remedy is this compound:

Distilled water, 1 pint; sulphate of zinc, 10 centigrams; orris root powder, 1 gram.

If on awakening in the morning the wholesome girl, who is also an intelligent girl, finds that her eyelashes are encrusted by secretions from the eyes, she will first soften those encrustations by rosewater, if that be available. If not, by warm, strong salt water, or by equal parts of witch hazel and water. There are many ointments recommended for such purposes. This is by Dr. Vaucaire, an acknowledged authority on the care of beauty. It should be applied after the lids and lashes have been washed in warm water. Never attempt to remove the encrustations while dry or the lashes will come with them:

Oxide of zinc, 10 centigrams; oil of sweet almonds, 100 centigrams; subacetate of lead, 10 centigrams; vaseline, 10 grams; tincture of benzoin, 12 drops.

While Dr. Vaucaire prescribed this ointment he preferred to administer it himself, and he advised the greatest caution about the application of it lest some part of it get into the eyes. In this, as in other formulæ of this nature, I urge my readers to have the compounds prepared by the best pharmacists.

The eyebrows may be made thicker by massaging them every night with finger tips that have been dipped into lanolin. It promotes their growth to brush them daily with an eyebrow brush. This removes the dust that collects about and chokes the roots of the hair. The growth of eyelashes is stimulated by brushing them daily with an eyebrow brush dipped into lanolin. Keep the eyes cool and clean by washing them morning and evening in an eye-cup filled with a mild solution of boracic acid, a teaspoonful of the pulverized boracic acid to a pint of water. Pour the boiling water over the acid and strain it.

To make the eyelashes grow dip a soft brush or cloth into lanolin and touch the edges of the lids with it. Repeat this every night before retiring.

I am opposed to face steaming, except as a last resort, when the pores are deeply clogged with dust. The evils of face steaming are two. It causes the skin to relax, stretch and become flabby and eventually to form wrinkles. And it so relaxes the pores that some of them refuse to draw together again, leaving unsightly holes in the face. Apply with a piece of medicated gauze the following:

Camphor water, ½ pint; glycerine, ¼ ounce; borax, ■ ounce.

For a face that is beginning to look heavy I advise exercise out of doors and abstinence from rich foods. A chin band of rubber or of strong muslin worn at night will help to support the muscles, also prevent one of the habits which produce sagging cheek muscles. Form the habit of holding your head high, with chin a little uptilted. The application of cloths wet in cold water makes the muscles firmer. Many pat the face with ice. Others pass the ice over it with long upward strokes from chin to forehead. The ice should be wrapped in cotton or in a piece of muslin.

A red nose is caused usually by excessive use of alcohol or by some form of indigestion or imperfect circulation. Loosening your clothing wherever it is tight, whether it be in collars, garters, belts, gloves or shoes. Eat plain foods, little meat and many vegetables and salads and much fruit. Drink water very freely.

You can often improve the shape of an ugly nose by gently pulling it, beginning at the bridge, between the eyes, and pressing the cushions of the thumb and first finger against the sides of the nose and drawing them slowly, gently, but with firm pressure, to the tip. Dip a soft complexion brush into green soap, which you probably know is a liquid, and scrub the parts affected by blackheads. The more obstinate of them may have to be pressed gently out with the fingers or a comedone extractor. Afterward apply cold cream to heal the skin irritated by the treatment.

For an oily nose try dusting it with this powder:

Bicarbonate of soda, 2 ounces; pulverized orris root, 1 ounce; pulverized spermaceti, 1 dram. Mix thoroughly and keep in a dry place.

A sparing diet chiefly of fruit and liquids and copious water drinking should soon clear the complexion. Alternate applications of hot and cold cloths to the skin help to clear it. A pinch of iodide of lime in a glass of water, in daily doses, for a week, will aid in the body cleansing which is necessary to banish the tendency to boils. A few Turkish baths will aid the work.

For blackheads I sometimes recommend scrubbing the affected parts with green soap, using a complexion brush. When they have been softened, pressing out the blackheads with the side of a needle that has been sterilized by passing it through a flame or through boiling water, is the best and simplest means. After pressing out the blackheads place cold cream on the affected parts to heal the irritation.

I have known double chins to be removed by bandaging them persistently in cloths wet in witchhazel, which is an astringent. Also press the muscles upward from the side of the face, using all the strength you can coax into your hands.

Cocoa butter in itself does not cause the growth of hair, but friction of rubbing any cream into the skin may cause the growth of hair if one is inclined to such growth.

Lemon juice should remove tan. It is too strong to use undiluted on the face. Use an equal quantity of water or of rose water with it.

This is a good lotion for decreasing the size of open pores, also for checking the greasiness of the face:

Rose water, 3 ounces; elder flower water, 1 ounce; tincture of benzoin, ¼ ounce; tannic acid, 5 grains.

All save oily faces are improved by the use of cold cream. But I know no reason for using a cloth in applying it. The cloth wastes the cream, and using it will probably cause the face to wrinkle. Pat the cold cream into the face with your palms or the cushions of your fingers.

There is no unfailing remedy for superfluous hair on the face, for even electrolysis sometimes fails. Try various remedies until the hair is killed. Tweezers often remove the hair permanently. Try them first, pulling each hair out gently, being sure first to sterilize the tweezers by passing them through a flame or dipping them into boiling water. After removing the hairs bathe the skin with witchhazel or pat into it a soothing cold cream. Washing the skin repeatedly with equal parts of peroxide of hydrogen and water weakens the hairs, as well as bleaches them, so that they will be far less conspicuous than if dark.

I advise no woman to undertake increasing the size of the bust without first consulting her physician. If he thinks it wise apply with muslin cloths to the breast this lotion:

Lanolin, 50 grams; vaseline, 50 grams; tincture of benzoin, 20 drops; iodide of potassium, 3 grams.

Here is an excellent remedy for an oily skin, especially on the nose, where such a condition often enlarges the pores. It is a drying lotion which tends to draw the pores together and is made like this:

Rose water, 6 ounces; elderflower water, 2 ounces; tincture of benzoin, ½ ounce; tannic acid, 10 grains.

Only extreme measures will relieve an aggravated case of blackheads or acne. With a flesh brush dipped into a lather made of warm water and white castile soap, rub the afflicted part of the face vigorously. If the ugly black specks have not then become loosened it will be necessary to steam them. Fill a bowl with hot water, press the face into the bowl, just avoiding touching the face

with the water, and cover the head and bowl with a large thick towel, so that the steam will not escape. This should be done for from ten to twenty minutes. When this bath is finished the acne will be so loosened that it will be possible to press the blackheads out bit by bit, using a sterilized needle. Afterward massage the part of the face treated with pure cold cream.

A famous French skin specialist recommends for acne:

Salicylic acid, 50 grams; pure lard, 50 grams.

Women who fear to apply to their faces anything which might grow hair may safely use the following cold cream:

Almond oil, 2 ounces; rose water, 4 ounces; spermaceti, ½ ounce; white wax, ¼ ounce; tincture of benzoin, 2½ drams; elderflower water, 10 drops.

Cocoanut oil is a good substitute for the more expensive cold creams. It both cleanses and feeds the skin. But be sure the oil you buy is absolutely pure.

Unsightly, bristle-like hairs on the chin can often be removed by massaging the skin around them with cold cream or with olive oil. Then sterilize a pair of tweezers by holding them in boiling water or dipping them into peroxide of hydrogen, and pull out the hairs one by one with short, sharp jerks. Bathe the skin from which they have been removed with peroxide or some healing lotion and anoint it with cold cream to relieve the irritation.

If the flesh about your nails breaks and tears it is because you have permitted it to get too hard. Press it back from the nails after washing the hands. Meanwhile, rub cold cream into the skin at the base of the nails before retiring; or soak them in a bowl of olive oil daily until they become soft.

For a scalp wash for summer I know nothing better nor more grateful than this:

Steep a pound of rosemary twigs in boiling water. Let them remain in the water for twelve hours. Strain the liquor and add to it half an ounce of Jamaica rum.

This, my favorite hair tonic, has the approval of experts in this country and in Europe:

Sulphate of quinine, 30 grains; tincture of cantharides, 1 ounce; glycerine, 1 ounce; powdered borax, 15 grains; alcohol, 2 pints; water, 2 pints. Dissolve the quinine in alcohol and the borax in water. Add the other ingredients. Allow the mixture to stand for one week. Then filter through paper.

In summer when too ardent attention from the sun makes your skin coarse try wearing at night a face mask coated with this honey paste:

Ground barley, 3 ounces; honey, 1 ounce; white of one egg. Wash off in the morning with tepid rose water.

Disfiguring blotches sometimes appear on the forehead without any apparent cause. I have known them to be removed by applying the following mixture with a tiny camel's hair brush:

Glycerine, ½ ounce; rosemary water, 1¼ ounce; carbolic acid, 10 drops.

For a bust that is not firm, this preparation is sold in France:

Oil of sweet almonds, 100 grams; white wax, 50 grams; tincture of benzoin, 25 grains; rosewater, 25 grams; pulverized tannin, 15 grams.

For enlarging an undeveloped or atrophied bust, Dr. Vaucaire recommends a flesh-making diet. He forbids the application of any pastes or lotions to the meager breasts, but prescribes this internal remedy:

Liquid extract of galega (goat's rue), 10 grams; laco phosphate of lime, 10 grams; tincture of fennel, 10 grams; simple syrup, 400 grams.

He advises two soupspoonfuls in water before each meal.

The drinking of malt extracts is recommended by some specialists. Personally, I advise all exercises that develop the chest for this purpose. One of the best is called "ceiling gazing." With the head bent as far back as possible, stare steadily at the ceiling,

breathing deeply while counting for each inhalation ten, for each holding of the air in the lungs ten, and for each exhalation ten.

Bathing the face with a mild solution of borax and water will help dry any superfluous oil. Relief for this unpleasant condition will also be found in this lotion:

Sulphate of zinc, 2 grains; distilled water, 1 ounce; compound tincture of lavender, 8 minims.

This or the lotion which follows should be applied after bathing the face, and two or three times a day as convenient:

Camphor water, 1 pint; pure glycerine, ½ ounce; borax, ¼ ounce.

Either cologne, alcohol, glycerine and water or tincture of benzoin is a good astringent for aiding in the reduction of a double chin. Or you might try for the same trouble the following:

Vaseline, 100 grams; lanolin, 100 grams; iodide of potassium, 6 grams; tincture of benzoin, 1 ounce.

I advise feeding arms that are too thin with olive oil or cocoa butter. Both of these are fattening agents. Patience and thorough daily applications of one of these will greatly improve the thin arms. But the patient should try exercise also. Holding the arms straight out at the sides and moving them round and round in a circle is a good arm developer.

Any of the following creams are excellent for massage purposes:

Oil of sweet almonds, 500 grams; spermaceti, 500 grams; white wax, 100 grams; rosewater, 50 grams.

This is especially good for the neck, hands and arms which are to be uncovered that night:

Glycerine, 1 ounce; rosewater, 1 ounce; oxide of zinc, 1 ounce.

The old-fashioned Nadine cream has a strong claim upon many beauties of many nations. It is made this way:

Lanolin, 4 ounces; cocoa butter, 4 ounces; glycerine, 4 ounces; elderflower water, 3 ounces; rosewater, 5 ounces.

This, valuable for its whitening as well as softening effect, is of English origin:

Milk of white almonds, 3 ounces; strained honey, 2 ounces; cold cream, 4 ounces; orange flower water, 5 ounces.

From England, too, comes this recipe, which has been adopted in slightly modified form by France:

Essence of cucumber, 2 ounces; juice of cucumbers, 2 ounces; spermaceti, 1 ounce; white wax, 1 ounce; olive oil, 1 ounce; almond oil, 1 ounce.

This is a well-known and valuable massage cream:

Expressed oil of almonds, 9 fluid ounces; rose water, 3 fluid ounces; fine sodium borate, 33 grains; spermaceti, 1 ounce avoirdupois, 400 grains; white wax, 1 ounce avoirdupois, 370 grains.

For making the limbs plump enough to correspond with a well developed body two methods are practicable. One is to rub olive oil into the skin every night before retiring. Or, if you prefer, a cold cream. Developing exercises that will enlarge the muscles are, for the arms, twirling them in large circles at the sides and holding them straight from the shoulders. For enlarging the muscles of the legs a similar exercise from the hips, swinging the leg in large, free circles, is valuable.

I am often asked if powder injures the skin. Pure rice powder can do no harm if removed at night with cold cream. Washing the face with water does not so effectually remove powder. Take the powder off with cold cream, which mixes better with it. Then cleanse the face with warm water and almond meal or oatmeal, or if you prefer it, with soap.

Paris physicians, also those of the Russian court, have withdrawn their objections to perfumes, and luxurious women are using them more than ever. They are more discreet and discriminating than formerly, relying more upon perfumes used after the bath, when they can be well absorbed into the skin, and causing them to remain longer than by a hit-or-miss application of them upon the hair or clothing. This, borrowed from England, is a delightful tonic applied to the skin after the bath:

Rosemary, 6 ounces; orange peel ground into fine powder, ½ ounce; thyme, ½ ounce; rosewater, 1 pint; spirit of wine, 1 quart.

Bath bags filled with equal parts of orris root powder and almond meal and bran are tossed into the baths instead of soap, and are more refreshing and quite as whitening.

An anæmic friend finds her tepid bath much more refreshing by adding to it a wine glass of this:

Eau de cologne, 1 ounce; spirits of camphor, ½ ounce; tincture of benzoin, ¼ ounce.

This is a new compound for the bath which I have used for my refreshment when fatigued from travel:

Bromide of potassium, 1 gram; carbonate of calcium, 1 gram; carbonate of soda, 300 grams; sulphate of soda, 5 grams; sulphate of iron, 3 grams; sulphate of aluminum, 1 gram; perfume to taste, either oil of lavender, oil of thyme, oil of rosemary, 1 gram; tincture of stavisacre, 50 grams.

An anæmic condition is not always the cause of the lips having a blue, parched appearance. Sometimes the cold weather will make them look so. Anoint them morning and night and before going out of doors with this solution:

Honey, 1 ounce; eau de cologne, ½ ounce.

Or with this salve:

Olive oil, 1 ounce; white wax, 1 ounce; spermaceti, 1 dram.

A good salve for freshening chapped lips is:

Spermaceti, ½ ounce; oil of sweet almonds, 1 ounce; white wax, ¼ ounce; cochineal, 1 drop; oil of roses, 6 drops.

Good for the same purpose is this:

Olive oil, 5 drams; white wax, 5 drams; alkanet chips, ½ dram.

Habits that mar beauty are as the little foxes that destroy the vines. They are many and small and mischievous. I mention some of them warningly for careless beauties, as signposts point the way on country roads:

Don’t eat too much.

Don’t chew the lips.

Don’t bite the nails.

Don’t sit on your foot.

Don’t eat many sweets.

Don’t read in a dim light.

Don’t bathe in a cold room.

Don’t neglect a daily outing.

Don’t read or write facing a light.

Don’t sleep in ill-ventilated rooms.

Don’t read when the eyes are tired.

Don’t read or write on a moving train.

Don’t open the eyes upon a bright light.

Don’t stand with the shoulders forward.

Don’t stand with the abdomen thrust out.

Don’t let your hands or feet remain cold.

Don’t make faces when you talk or listen.

Don’t drink much wine. The less the better.

Don’t neglect to bathe your feet every night.

Don’t sit on the last three bones of your spine.

Don’t be afraid to yawn or stretch when alone.

Don’t thrust the hips far backward as you walk.

Don’t sit with one shoulder higher than the other.

Don’t stand with one hip higher than the other.

Don’t fail to sleep as many hours as you require.

Don’t wear too light weight clothing in winter.

Don’t sleep in a room crowded with draperies and rugs.

Don’t forget to visit your dentist once every three months.

Don’t let the chin bury itself in the neck. Keep it high.

Don’t wear tight shoes or tight gloves or tight corsets.

Don’t brush or comb the hair roughly. The scalp is tender.

Don’t go into the outer air directly after washing the face.

Don’t be afraid of rain or snow. They are tonics and beautifiers.

Don’t be discontented. Discontent engraves ugly lines in the face.

Don’t fall asleep with the features drawn in anger, worry or fatigue.

Don’t forget that the warm bath is a sedative; the cool bath a stimulant.

Don’t use every new cosmetic you see advertised or hear recommended.

Don’t wear clothing so heavy that its weight drags upon the vital organs.

Don’t dwell upon unpleasant things. Dismiss them if you value your beauty.

Don’t allow the skin to grow dry. A dry skin is the parent of many wrinkles.

Don’t rest upon large pillows. They cause round shoulders and double chins.

Don’t lie down for rest with your nerves and muscles tied in small, hard knots.

Don’t forget that the reclining posture is a storehouse of strength and beauty.

Don’t let the muscles grow flabby. Firm muscles give the appearance of youth.

Don’t lead a too regular life. A varied programme is better than an unvarying one.

Don’t keep your rooms either too hot or cold, but at an even, moderate temperature.

Don’t be afraid to work, and to work hard. It is only worry mingled with work that kills.

Don’t allow yourself to become ill. Every illness subtracts from vitality and adds to apparent age.

Don’t think that when you have brushed your hair your duty to your head is done. The scalp must be massaged.

Don’t wriggle the feet or fingers or hunch the shoulders. Find other and less ugly outlets for your nervous energy.

Don’t moisten the lips with the tongue to make them red. It will only cause them to roughen and chap.

Don’t forget that the eye bath, the nasal douche and the mouth bath are part of the daily ceremonial of cleanliness.

Don’t forget for one moment that health is the basis of beauty. And build your beauty upon that only sure foundation.

Don’t neglect the protection for your skin when you go out or the care for it when you come in from out of doors.

Don’t think that to keep the teeth beautiful they must be continually brushed. After the daily brushing remember the mouth bath.

Don’t think you are ever too tired for the night toilet. The face must always be washed and cold creamed at night if you value your complexion.

Don’t, especially if you are slenderly built, permit the shoulders and chest to sink. If you are too tired to hold them up take a nap, or at least recline for a time.

CHAPTER XXII

THE BEAUTY’S PERSONALITY AND HER CLOTHES

Have you ever seen a jeweler at work making a gem as fine and handsome as he can or as the nature of the jewel will permit? That is what you must do for yourself. Polish your personality.

The jeweler makes the jewel shine with all its possible luster. That is what every woman should do for the gem which is herself. The jeweler holds the gem to the light to see what is its best angle and sets it so that that angle is prominent. So should a woman do with her best feature.

Study yourself in silhouette. Place yourself before a mirror so that you can see yourself as one would see you who hurriedly brushed past you in the street. See yourself sidewise. If you see that you have a good profile and that the lines of your figure are graceful, keep your side to the world, so to speak. Remember that this is your best line and live up to it. Dress your hair so it will enhance the profile, making it cameo like. If you discover a style of dressing your hair that is becoming to you, and that makes that profile stand out in finer relief, never mind whether it is the fashion of to-day or of ten years ago. Its beauty will be its excuse and will make it the fashion for you. So in your gowning. If your figure has a better silhouette when draped in full gathered and shirred effects follow them. If, as is liable to be true if you have a full figure, flat folds and tucks and bands are more becoming, make abundant use of them.

Learn dressmaking yourself, if your means are limited, and learn to apply your own principles of dressing. Make yourself individual. It costs but little to dress well if you can make your own clothes. If you find that your front view is better, face the world, as it were, instead of turning your side to it.

I have heard of some women, “Her hair grows prettily.” When I have scrutinized their faces I have found that what was meant by the phrase was that it grew in odd, attractive little ripples or scallops about the face. Yet I have seen the same women brushing their hair flat and pressing it back in a hard, straight line from their faces. These human jewelers were neglecting one of the best angles of their personality. I have seen women whose rich, thick hair was their greatest charm draw back the hair from their faces and twist it up in a hard little knot. I wanted to cry out against this thoughtlessness.

I once overheard a pair talking while in the first stages of love-making on board a transatlantic steamer. The man said, “You have beautiful eyes, but you don’t know how to use them.” The next day as I saw her while on a deck promenade I saw that he was right. She half covered them with heavy, lazy looking lids. When she looked at any one with them she looked with a slow, steady regard and without a smile in them. If I had had eyes like that I should have been most industrious with them. I would have opened them very wide, very often every day. It would have illuminated conversation, and promoted mutual understanding. And I would have taught them the pleasant trick of smiling.

I know a woman of whom it has often been said: “She is handsome when she smiles, but she hardly ever smiles,” and this should have been enough of a tip, as you say in America. Yet it wasn’t. Whenever I saw her her lips drooped. Her cheeks muscles relaxed. If anything startled her out of herself she smiled, quickly, roguishly, with a flash of intelligence and good humor that was entrancing.

Her smile transformed her from a plain, dejected looking woman to a radiant, attractive one ten years younger in appearance than she had looked a second before. If she had polished her personality she would be always living up to that smile.

I know another woman, more intelligent, though younger. She has lovely, red-gold hair. At a time when it was fashionable to wear hats that come low upon the face, completely hiding the hair, I said to her: “And do you hide your beautiful hair beneath the foolish fashions?”

“No,” she answered. “Somehow, I always manage to show some of it. Perhaps I draw it back from the forehead a little more than the fashion requires. Or, I may tilt it a little more to the side than is necessary. But I always show my hair.” Polishing her personality, you see.

If a woman has a beautiful mouth she should be at more pains than another to massage the lips to keep them full and moist. She should massage the gums to keep them strong and red. And of her teeth she should take infinite care. Such a woman should smile and smile again, for fine teeth and a fresh, sweet mouth are always attractive.

If she has a classic chin and a fine throat she should keep the chin well up to reveal the line from chin to chest.

If her hands are pretty she should wear her sleeves short enough to display them. If her hands are shapely and tapering she should wear her sleeves still shorter.

If the lines of her throat and shoulder are good she should form the Dutch collar and low necked habit. If her figure is good she should emphasize that within the limits of modesty.

In short make radiant your personality. Discover your best points and keep, preserve and accent them. To use your plain Americanism: “Keep your best foot forward.”

Fashions change, but taste endures. Fashions come and go, but becomingness is a fixed quantity.

The woman who is wise in her own beauty will make this her creed. She will determine after much observation of herself what is becoming to her and what is not, never to cross the danger line between.

She will not aggressively defy fashion. She will adopt its becoming modes, and adapt its unbecoming ones to the point only of becomingness. But she will resolutely determine that she will wear nothing that will detract from her beauty.

In the matter of dress, I have the courage of my convictions. I will not wear that which I believe to be unbecoming to me. Sometimes I may fancy I look well in what another may not admire as a part of Cavalieri. In that I may be mistaken. But I never consciously wear what makes me look less well than I would otherwise.

For instance, you will observe from my photographs that I almost never change the style of wearing my hair. Long ago I found that flat waves drawn low upon my brow and cheeks were becoming to me. In itself the style is a trying one, but it happens to be becoming to my type of face. The Italian women are almost the only nation that can wear it to advantage. It seems to belong to the large, soft eyes, straight nose and delicate chin of the race. And so through the succeeding years I have worn them, and because I looked well in them have worn them in the morning, in the afternoon and in the evening, have worn them to early musicales, to luncheons, to teas, for drives and the opera. I have varied the style only when the times or character I was playing in opera demanded that they be changed.

It is my opinion that the woman who discovers the style of hair dressing that is adapted to her individual style and with some possible slight modifications, which are concessions to the mode, preserves that general style until the chiselling of the years has so changed her face that she requires a different coiffure, is the clever woman. Such a woman is Alexandra of England. The court hair dresser, a great artist in his way, gave weeks to studying the coiffure that should best frame the facial charms of the Princess of Wales.

He determined upon the present style. Queen Alexandra dressed her hair in the same style for thirty years. It is admirable for her long, patrician features, setting off their mingled delicacy and strength, and her fine English coloring. In time she will doubtless change the style to one softer and looser, calculated to lessen the effect of aging features. But that time, happily, is far off for her gracious Majesty. In general, it is true that preserving the same outlines of a coiffure for most of a lifetime makes a woman seem younger.

In general, too, these rules may be followed in choosing the coiffure that shall be yours. Do not accentuate that which nature has already accentuated too much.

If nature has given you a round, chubby face counteract this too decided tendency by building the hair high. Give the coiffure the effect of a pyramid. The one high point at the top of the head will materially lengthen the face and lessen the roundness which tends to insipidity. The high coiffure will thus give distinction to a face that had lacked it.

If the forehead is too low comb the hair loosely back from it. This will add to the alertness and intelligence of the expression. If, on the other hand, nature has given you the knobby, by which I mean what you call the intellectual, forehead, the brow which is full and high and broad, with projecting bumps, modify nature's extreme by training the hair to fall in loose tendrils upon it. Also comb the rest of the hair, but loosely, from about it. Never tightly, for that will give the drawn, frightened look which nature has already carelessly bestowed.

If your face be broad, the high coiffure increases its apparent length.

If yours be a slender countenance, then affect the low coiffure, for its tendency is toward breadth.

If the face be broad, do not build the hair out loosely about the ears. Instead comb it upward above the ears.

If the face be slender, its apparent breadth is added to by the "fluffing" out of the hair about the ears.

If the face is angular, its hardness is reduced by a soft arrangement of the hair.

In arrangement of the hair remember that balance is the law of beauty, as it is of wisdom. For instance, balance the heavy jaw by drawing the hair in a loose mass well forward above the brow. Balance the snub nose by a loose coiffure with no jutting protuberance at the back to suggest that it is the corresponding pole of the nose.

As to color of the hair, it is my judgment that we would better leave it as nature painted it. Nature is the greatest colorist. She matches complexion, eyes and eyebrows perfectly with the hair. Transform your hair, and you will be at the trouble of transforming your entire person.

We are not to blame for our hair, but we are to blame for our hats. They must look as though they belonged to us as our faces, our eyes, our teeth belong to us.

I always trim my own hats. First I began to trim them because I had not the money to buy them or to pay for trimming them. Now I trim them because no one can do so to suit me.

I prefer simple hats, for the sufficient reason that they are more becoming to me. But an overtrimmed hat is inartistic. It is ugly. It is vulgar. The hat should serve its function of being a becoming frame for the face. The head should not be a mere pedestal or milliner's dummy for a monstrous hat. Women answer criticisms of the terrible travesties now worn, "But they are the fashion." Yes, but who made them the fashion? You and you and you. A fashion can be killed at its birth, in the shops of Paris, if women will but determinedly say: "No, no, no. I do not like it. I shall not wear it. Show me others."

Remember the law of balance. A woman with a tapering chin should wear a hat built to a corresponding peak at the top. The effect of these two peaks should be to form an agreeable oval.

The round-faced woman's safety of becomingness lies in the hat in which angles predominate. It should have stiff ribbon bows and sharp aigrettes, or pointed wings and dagger-like ornaments. This woman will always be improved, too, by wearing V effects in coats and wraps and gowns.

The hornlike effects should be avoided by the woman with sharp features. Her task of lending a semblance of softness and roundness to her face is made easier by a hat with a soft brim trimmed with a fall of lace or a shirring of silk or velvet. Also the sharp-featured woman should never wear a sailor hat. Neither should any woman over twenty-five.

Here are some rules about dressing, so fundamental that I would hesitate to give them were it not that every day I drive down Fifth Avenue I see them flagrantly transgressed.

For instance, I see the short, stout woman wearing a short, stout coat. The long, thin woman wears a long, thin coat. That is, each woman, forgetting the law of balance, has chosen that which accentuates what nature has already overaccentuated. The short coat

should have been worn by the tall woman. It would have made her seem shorter. The long coat should have been worn by the short woman to disguise her brevity.

I see short women wearing horizontal trimming, when they should have had lengthwise trimming, pointed trimming or no trimming at all.

I see a tall, slender woman wearing a long cape, when she could have divided her superabundant height in two by wearing a short one.

I see a short woman wearing a flounce about her already absurdly short skirt. By some perversity the short woman tries to emulate the barrel and the tall woman the telegraph pole.

The woman with a crane-like neck bares its funny length to a grinning world, and the woman with a mere line where a neck should be muffles that up with ruches that make her look like a frightened setting hen.

If only they would have ever before them the thought, “What is becoming to me?” and put far behind them the other question, “What is the fashion?” then would women dress artistically, not ridiculously.

I do not preach that which I am not willing to practice. It happens that I do not like white. To me it is a dead, trying color. Therefore I never wear it. I am told this is to be a white season. I answer, “It will not be for me.” And I continue to wear blue or black on the street, and pale shades of rose or blue or green or yellow at night. And merely because it happens to be “a white season” people do not forget to look at La Cavalieri in rose or yellow or blue or green.

Let me recall to you the most beautiful of American women, Maxine Elliott. One winter the coat covering the hips, forming a second thickness of cloth upon them, was fashionable. Did Miss Elliott wear it? Not at all. I saw her wearing a very pronounced cutaway coat, one in which the frock part of the coat was cut at the very middle of her hips, so taking from instead of adding to the width of her figure. And the Maxine Elliott hats! Have you noticed how like they are, no matter what the fashion?

Always beautiful, because of elegant, yet simple lines, but more particularly beautiful because they are becoming to their wearer. They are very little trimmed; usually with large, flat bows or low curving feathers. Almost always they are black, or black with a touch of white, but always they look as though they were designed for or by Miss Elliott, as I doubt not they are.

The lank woman must shun the V-shaped corsage as His Satanic Majesty is said to avoid the bowl of Holy Water. The broad corsage, draped with full flounces of lace or tulle, will be most becoming.

In the same degree the stout woman must avoid the corsage with round effects. She should seek the pointed effects to counteract her redundancy of curves.

I will not go further into details on this subject. The intelligent woman to whom this law of balance in dress has been presented will work out successfully her own problems.

It applies as well to colors as to form. The high-colored woman needs pale tinted colors to reduce her own exuberance of color, while the neutral tinted woman, she with light gray or blue eyes and ash-brown hair, requires in her youth at least brilliant shades.

When buying your wardrobe I beg of you to think less of the fashion plates displayed by your tailor and dressmaker than of your own style.

Everyone has a style of her own, and that is good style for her. One authority on woman’s dress even goes so far as to urge women to know themselves so well as to decide whether in their composition mind or soul or body dominates. “For,” according to this lecturer on womanly beauty, “each of these three parts of your composition is represented by a color. If you are a woman of intense spirituality you should wear much yellow, for that represents the soul. Should you lean more to the material side of life you are best represented by red. If you are one of the growing army of the intellectuals, this authority advises wearing much of the mental color, which is blue.”

It occurs to me to inquire whether that is the reason why women of strong mentality are often referred to as “blue stockings.” I do not wholly agree with this woman lecturer.

If, for instance, you are a red woman, why not wear considerable yellow? It will give you a more soulful aspect, and, if our manners react upon our characters, why should not colors? Wearing the soul color may develop latent soul qualities. Or the red woman, by

wearing much blue, might, to use a term of the stage, “convey an illusion” of greater mentality than she has, and perhaps stir that part of her self to greater activity.

It is an interesting theory, but may, perhaps, be pursued to the point of attenuation. One quality I like so greatly in you Americans is that you are practical, and theories so tenuous as this I have quoted move you to laughter. I recall that when one of your authors wrote of the color of individual auras and talked of a “pink personality,” she greatly interested the humorists. I leave with you this theory to smile at or to adopt as you like.

But in what I shall say next I am most gravely serious. That is that in selecting your wardrobe I would have you think far more about your individuality than about the passing fashion. I do not know what will be the next caprice in furs. I do not care. Being tall and slight I shall choose long-haired furs, as the silver fox, because, to use an Americanism, I can “carry them well.” But if you who read this are short, and especially if you are short and stout, wear short-skinned furs, as mink and seal and sable, if you can afford them, for long-haired furs will render you out of drawing, absurdly costumed.

While choosing your hats and wraps, your gowns and gloves, be for once self-centered. Self-centeredness is excusable when one is shopping. It is in the direction of economy, for if we think steadily of ourselves we will not purchase a fur coat in which our sister looks adorable but ourself ridiculous, and we will not order a gown that will prove so unbecoming that we will give it away after once or twice wearing it.

Keep in mind, after your own individuality, certain art principles that apply to dress. This is a good one as to color. “Dress up to your eyes, your hair or your complexion.” Permit me to explain. If a girl has brown eyes she may not always wear brown gowns. But she can be exceedingly careful to wear no tint that will make her creamy skin look sallow. For her creamy shades are becoming, because they harmonize with her complexion.

If a girl has red hair she will be wise if she wears shades, regardless of the tint of the moment, that will throw the hair into relief--as blue, or green, or black. If a woman has Irish eyes--that fascinating mixture of blue and gray, that holds in its depths much of infant innocence yet much of worldly wisdom, deep eyes that fascinate because they are inscrutable--she will look her best in gowns that match her eyes, the same indeterminate blue and gray.

Think of yourself steadily and not tenderly in the selection of stuffs. If you are thin and active, soft materials, as chiffons, crêpe de chines, light weight silks, will be becoming. If you are of heavier habit, heavier silks and broadcloths are more expressive and so more becoming.

The dividing line between the skirt and bodice is ugly. If you cannot have a one part dress, then hide the dividing line by a girdle. If you are stout, let the girdle be of the same shade and material as the gown. If not slender, you may safely wear a girdle of different shade than your gown.

Artists know the beauty of the straight line, and for a few seasons coutourieres have groped their way toward it. Parallel lines running lengthwise are the lines of beauty in dress because they consistently follow those of the figure. For this reason a gown whose pronounced lines are from the shoulder, the drapery curving slightly at the waist, give grace and beauty to the figure. Trimmings that run around the figure always lack beauty, and if of contrasting material they have a ludicrous effect. The high girdle gives an appearance of greater length to the limbs. The girdle, if not of the same color and material, should not be of too glaringly the opposite.

Remember that stiff effects are always inartistic, so avoid the appearance of being trussed up, as a fowl in the oven or soldier on parade. For this reason shun tight sleeves, tight gloves, or skirts, so heavy or narrow that they make your gait an awkward one. I am glad that fashion permits the wearing of loose gloves. They give ease to the hands and are far more graceful than the tight ones that gave the hand the appearance of being stuffed into it.

When selecting your hat, a bit of brilliant color may be introduced; but let it not be directly above the face, for it will give to the face the illusion of being pale, whether it is or not.

CHAPTER XXIII

ODDS AND ENDS OF BEAUTY CULTURE

Three months recently in Russia and six months in Paris taught me some new fads in the cultivation of beauty. While you Americans are so clever, as well as beautiful, you may not have heard of some of these. I will, therefore, call the roll of those devices for the improvement of beauty which are finding present favor in Europe, some of which seem to me to have considerable scientific value.

But I ought to say that I have not myself personally used or tested all of these rather heroic new methods. Not all medical men are agreed on all things, especially on new things, and I advise my readers to ask the advice of their doctors on some of these matters.

There is, for instance, what is known as the vaccination cure for pimples. Pimples I have called “spots on the sun of beauty.” Spots, whether on a frock or a face, are disfiguring, and it is desirable to remove them as soon as possible. Inoculation by a special form of vaccine is the latest method adopted by the medical profession. It has been in many cases very successful. The only objection is that it is still comparatively expensive.

The new theory is that pimples are caused by the presence of malefic germs. A culture is made of these germs in beef broth. The fluid is then rendered sterile by heating it to the boiling point. A small vialful of this broth contains hundreds of millions of the germs. While the germs themselves are dead, the peculiar poison generated by them remains. The treatment is given by a hypodermic injection. This poison is destructive to the living organisms, and in a few weeks’ treatment obstinate cases of pimples have been completely cured by the welcome new process.

For obstinate cases of acne some advanced physicians are utilizing the X-ray. Blackheads are always disfiguring. Certain physicians have adopted the principle that these micro-organisms lodge in the follicles from which spring the small hairs that form a down on the cheeks. These micro-organisms spread fast and cause inflammation. The X-ray is summoned to check the spread of the inflammation. This they do without danger to the skin. After three or four treatments the face looks as though it were badly sunburned. This appearance remains, it seems to the patient, discouragingly long, but the results are most gratifying in every case I have studied. The acne has been permanently removed and the complexion left beautifully clear.

A third scientific treatment of great aid to beauty is the removal of scars by an injection, locally, of a healing serum, beneath the skin. Its function is to loosen the structure, relax the drawn tissues and smooth the surface that had been, to use an Americanism, “puckered.” There is in this last remedy the element of risk that always obtains when a foreign substance is injected into the circulation.

Because of this element the method has not the entire endorsement of the medical profession.

A method that has great vogue just now is the new or modified massage called patting. This is accepted by those who have always been consistent enemies of massage as it is generally given. Their theory is that massage, as many have known it, merely moves the wrinkles from one part of the face to another. Patting, they declare, does not drag the skin, but builds up the muscles and promotes the circulation. The name is a well-fitting one. Patting is done very lightly with the tips of the fingers.

The nose clamp is a new and amusing device adopted by beauties and would-be beauties to prevent the spreading of the nostrils and to give the nose, that would otherwise be too round, a delicate point. I have called on my friends in the morning and have been received in their bedrooms. They looked very charming in their night robes of delicate batiste, embroidered and further ornamented with pink and blue bows, not pink and blue bows on different gowns, but combined in the same gown. Their hair carefully parted from the point of the forehead to the back of the neck, and braided in two loose braids, either hangs becomingly over their shoulders, one braid tied with a blue bow, the other with a pink, to match the ribbon garniture of the night robe, or is twisted loosely around the head. Their complexions looked fresh and cool from their bath of cold cream, but they all looked odd, and I shrieked with laughter at them because they wore nose clamps. One who disliked the touch of the cold metal substituted the homely domestic article, the clothespin. Both the clamp and the clothespin are well protected by a lining of white silk or velvet. Absurd as these things look, I was assured by all who wore them that they served admirably their purpose.

Ice has come to be one of the first aids of beauty. It is used after massage of the face and neck to harden the muscles. I find women using it to drive away wrinkles and this seems to me scientific, for while the shock of the first application will drive the blood from the surface, it causes it to rebound, bringing a fine flush to the skin and feeding the neglected and shrunken tissues.

Whatever renews the tissues eradicates wrinkles.

Many physicians are endorsing sulphur facial baths to cure acne. This lotion is applied several times a day, they told me, with good results:

Rose water, 4 ounces; precipitate of sulphur, 1 dram; tincture of camphor, 1 dram.

Women are beginning to realize that sagging muscles, rather than a superabundance of flesh, are the cause of the double chin. They are preventing, as far as possible, the falling cheek muscles and the pendulousness of the chin muscles by hardening them with lumps of ice held in the hand and pressed against those muscles as long as the pressure can be endured; also by wearing chin bandages.

First the fancy, then the fad, then the flitting. This is the history of most announced discoveries of the means to heighten beauty. They have their little hour of discipleship; their impulsive following; their period of vanishing. Yet beneath nearly all the beauty fads there is a more or less well applied principle of science.

For instance, there is the rubber chin band. The band to control the usurping flesh of the double chin was first of muslin. Then it was improved by the use of elastic. Now it has evolved to its best state, that of strong yet light rubber, made with a throat latch resembling the lower part of a horse's halter. Attached by a clasp on either side are straps that fasten at the top of the head. The original idea of compressing the flesh so that it would form in a smaller and becoming mold was sound, but the later idea of using rubber appeals still more to common knowledge. The wearing of rubber next to the skin causes perspiration.

Therefore, the rubber band will not only hold the flesh of the pendulous chin in place, but by causing free perspiration it will gradually reduce its size. The rubber band, worn at night, and frequently during the day, for a half hour or more at a time, is the best cure for the double chin the new year has offered us.

The aged hand has been a source of much mortification and anxiety to the woman who has left her thirties and her forties behind her. Yet electricity, that prime aid in the rejuvenation of beauty, has come to her aid, and now the woman who has a good many years to her credit, but who does not care to admit that balance, goes to the beauty parlors, settles back comfortably in a reclining chair, and renews the youth of her hands by electrical treatment.

The operator traces over the hand again and again, round and round, focussing most on the base of the back near the wrist a small electrical machine attached to a light battery. The skin of Madame's hands begins to tingle. The blood rushes in a flood to the surface. In a few days she notices that the ugly furrows, trenches dug by the cruel spade of time, are being filled up. After a little longer time they are entirely filled and present an even surface. The hand has been plumpened.

The work of rejuvenation has been done. With occasional renewals of this treatment, combined with much nightly feeding of the hands with a plumpening oil or cold cream, they will keep their renewed youthfulness.

Either of the following creams I recommend for that purpose:

Spermaceti, 6 ounces; white wax, 2 ounces; oil of almonds, 16 ounces; glycerine, 4 ounces; rosewater, 4 ounces; borax, 1 ounce; oil of rose, 20 minims; extract of jasmine, 1 ounce.

This whitens as well as plumpens the hands:

Alcohol, 3 ounces; glycerine, 2 ounces; cologne, 2 drams; boric acid, 4 grains; quince seed, 1½ drams; carbolic acid, 10 grains; glycerine of starch, 2 ounces; oil of lavender, 20 drops; distilled water, 2 pints.

A soothing and whitening, as well as feeding, cream is this:

Cucumber essence, 1 pint; cucumber juice, 2 ounces; oil of almonds, 1 pint; olive oil, 1 ounce; white wax, 1 ounce; spermaceti, 1 ounce.

Transcriber's Notes:

Italics are shown thus: _sloping_.

Variations in spelling and hyphenation are retained.

Perceived typographical errors have been changed.

PREFACE.

The aim of this book is to demonstrate the nutritious and appetising possibilities of vegetable foods. Cattle are becoming so diseased that apart from a humane revulsion against the consumption of meats in daily food, man is being driven for his own welfare to seek purer food substance. Any physical habit indulged in for generations is difficult to overcome, and the transition period between daily meat eating, and pure vegetarianism is a difficult one. We have endeavored to suggest such a variety of tasty and nutritious foods as will materially aid in making the change.

We do not claim this to be an exhaustive treatise on Vegetarian Cookery; only a clear and practical aid in the better preparations of some of the delicious products of the Vegetable Kingdom. Many children show a natural dislike to meats, and Mothers are at a loss how to supply them with proper nourishment when they reject the meat. Requests have come to us for aid through this very fact; and was one of the incentives to the bringing out of this book.

Mothers will have no difficulty in finding a plentiful variety of relishable and nutritious foods for the children if they will study the following pages. Equally easy will the formal dinner appear when one wishes to entertain Vegetarian friends.

INTRODUCTORY.

Vegetarianism from a Theosophical standpoint involves a whole philosophy of life. The short quotation on our title page well expresses the theosophic concept of the Unity of life, and the law of cause and effect which we call Karma. Life is fundamentally a unit, and aught that works ill to any manifestation thereof has effect on all. Through occult science we are taught a very practical lesson of direct benefit to the individual, by a diet free from blood. As clearly stated in Annie Besant's manual on "Man and his Bodies," man molds these instruments of his will, or true self. These bodies are but instruments; in no sense the man himself; and these instruments or bodies are finely responsive to the operator, or true self, only as they are purified and harmonized. Gross foods, and gluttony make gross bodies, not only physical, but astral as well. For the astral bodies feed on the subtle emanations of the foods supplying nutriment to the physical encasement. If, through the consumption of meats we feed the astral on the emanations of blood or animal life, we intensify the gross desire-nature of the astral man, intensify the passional-nature, and at death, when the physical body is cast aside as a discarded garment, the dense, gross, astral body is held to corresponding planes in the realm of the astral; thus the purgatory of the Roman church becomes a very real and uncomfortable experience. If, on the contrary, clean habits of life have purified the astral body, when it is liberated at the hour of death from the prison house of flesh it is not of the same degree of density as the lower astral planes, and it passes on to the sunlit meadows of that world and away from its slums.

Alcohol has also a most pernicious effect on the astral vehicle, and for that reason is eliminated from the food of the occultist. It is a great mistake to give to the perishing, alcohol, or narcotics, as it has really a more serious effect on the out-going astral than on the physical encasement. When man learns to live on clean food, to have clean habits and to think clean, generous thoughts, there is naught in all this wonderful universe that he need fear.

PRACTICAL

VEGETARIAN COOKERY.

SOUPS.

SOUP STOCK.

Any nuts with herbs dried and ground will nicely flavor and enrich stock.

STOCK FOR CLEAR SOUPS.

Place four onions in large kettle with a gallon of water, let boil steadily two hours, then add one carrot, two small turnips, two parsnips, three bay leaves, one head of celery (if celery leaves cannot be had a saltspoonful of celery seeds may be used), one-eighth head of cabbage. Let boil four hours; strain. This should make a gallon of strong stock.

TOMATO BOUILLON.

Put one quart of tomatoes, with one and a half quarts of water, in kettle over the fire; add one tablespoonful of chopped onion, two bay leaves, four whole cloves, one level teaspoonful of celery seed and a half teaspoonful of pepper. Cover and cook twenty minutes. Strain through a sieve. Beat the whites of two eggs until partly light, add them to the tomato, and boil rapidly for five minutes. Strain through two thicknesses of cheese cloth. Reheat, season with two teaspoonfuls of salt and serve with croutons.

JULIENNE SOUP.

Boil tender, not soft, one small potato, one small carrot, one half cupful of green peas (canned peas can be used), and one small head of celery, if in season; if in summer, asparagus heads will do. Cut the large vegetables into small dice, and add one quart of the clear stock. Take the yolks of two eggs, whipping them up with one tablespoonful of milk with salt to taste, put in a crockery cup and set in steamer; let cook until solid; set away to chill, then cut in small dice or fancy shapes and add to the soup.

MACARONI SOUP.

One-third package of Macaroni, or Spaghetti; cook in boiling water, salted to taste, until tender, then drain quickly and add one quart of clear stock. Bring to a boiling point and serve.

TORONTO BISQUE.

Place a sauce pan, with half a cupful of fine chopped onion, the same of carrot and celery, over the fire; cover with boiling water; cook five minutes; drain off the water. Melt one tablespoonful of butter in a saucepan, add the parboiled vegetables; cover and cook ten minutes, stirring often; then add one heaping teaspoonful of flour, stir and cook two minutes, add one cupful of canned tomatoes, and one quart of boiling water, cook fifteen minutes. Shortly before serving rub the bisque through a sieve; mix the yolk of two eggs with half a cupful of cream; add it to the bisque, and stir for a few minutes over the fire. In the meantime cook two ounces of macaroni in salted water thirty-five minutes; drain and rinse it off with cold water; cut the macaroni into small pieces the size of a white bean; add one cupful of this macaroni to the bisque and serve.

TOMATO SOUP.

To one can of tomatoes add one pint of water, four peppercorns, one half bay leaf, four cloves, and a bit of mace; cook until the tomatoes are soft enough to strain. After straining add two teaspoonfuls of sugar, one teaspoonful of salt, one fourth teaspoonful of soda; thicken with two tablespoonfuls of butter and three tablespoonfuls of flour blended together.

CREAM OF TOMATO.

To one half can of tomatoes, add one scant tablespoonful of finely chopped onion, and three spikes of celery, cook until tender, then strain through a wire sieve; season to taste, add soda the size of a pea. Scald one quart of milk, mix one teaspoonful of butter with heaping teaspoonful of flour, dissolve in warm milk and stir into the scalding milk; add to the strained tomato stock just before serving; don’t let it stand after milk is added. Serve with crackers.

DUTCH SOUP.

Take one bay leaf, one half can of tomatoes, one half can of corn, one medium sized onion, chopped; two heads of celery, cut fine (or one half teaspoonful of celery seed); one half cupful of rice, one half cupful of oatmeal, one carrot, cut in dice, one eighth head of cabbage, cut fine, one small turnip, cut fine, gallon, or more, of cold water, with salt to taste. Cook gently until all vegetables are thoroughly tender. Very nice served plain, or with dumplings. This soup is a hearty luncheon in itself.

CREAM OF POTATO.

To one head of celery, cut fine, add one teaspoonful of chopped onion, one large, or two medium sized potatoes, sliced; cook until you can mash through a wire sieve; then add one quart of scalding milk, one half cupful of cream, and thicken to a cream with buttered flour. Serve with oyster crackers.

POTATO SOUP WITH DUMPLINGS.

Pare, wash, and cut into dice, six good sized potatoes, chop fine one onion, place in kettle with water to cover, salt to taste, and cook until tender; then add one quart of cream or rich milk, add one tablespoonful of butter, a dash of pepper, and let come to a boil.

Have ready dumplings made as follows: To four heaping tablespoonfuls of flour, add pinch of salt, one even teaspoonful baking powder, one tablespoonful cream, and water enough to make soft dough; do not knead, mould into small lumps, size of walnuts, and drop into soup as soon as the soup comes to a boil. The dumplings take about eight minutes to cook, and the kettle should be kept covered all the time. The soup needs to be carefully watched that it does not boil over or burn; it is well to lift the kettle free from the stove every three or four minutes, giving it a little twirl, but do not lift the cover until the eight minutes are passed, for

sudden reduction of temperature may make the dumplings heavy.

RICE POTATO SOUP.

To two tablespoonfuls of rice, thoroughly washed, add one potato cut in large dice, one tablespoonful of finely chopped onion, and one-third of a teaspoonful of celery seed; cook until tender, salt to taste, add one quart of hot milk and one half cupful of cream. Serve with crackers.

SOUP WITH NOUILLES.

Nouilles--Beat two eggs, mix to a stiff paste with flour and a pinch of salt, roll out very thin on well floured board, let dry a few minutes, then roll snugly, cut from end of roll in strips as thin as possible, and shake out thoroughly. Have one quart clear stock hot and shake nouilles in gently. Let it simmer until nouilles are tender.

BEAN PURÉE WITH NOUILLES.

Take one pint of cold Boston baked beans; place in kettle with two quarts of water, one small onion, chopped fine, one small bay leaf; let boil until onion is tender, put through a wire strainer (if too thick, more water can be added); season to taste, add nouilles and let simmer until they are tender.

BEAN PURÉE WITH TOMATO.

To one bowl of cold Boston baked beans, add one half onion, chopped; one half teaspoonful of celery seed, one pint of tomatoes, one bay leaf, and one quart of water. Let boil one half hour, then mash through a colander, if too thick add more water, have ready one heaping teaspoonful of flour blended smooth with water, stir into the strained mixture, and put soup back on the fire, letting it come to a good boil. The flour is added to keep the soup an even creamy thickness. Serve with croutons.

RED KIDNEY BEAN SOUP.

To one can of red kidney beans, cooked in their own juice and then mashed through a sieve to remove skins, add one quart of rich fresh milk, one tablespoonful of butter, salt and pepper to taste. Let come to a boil and serve with croutons, or wafers.

BLACK BEAN SOUP.

Soak a pint of black beans in two quarts of cold water over night; boil them four hours or more; mash them thoroughly, strain them through a colander into a saucepan, cover, and let boil. Mix a tablespoonful of flour smoothly with cold milk or cream, stir into the boiling soup until it thickens; add a cupful of butter; if it is too thick, thin with boiling water; add a tablespoonful of lemon juice. Season and spice to taste.

SPLIT PEA SOUP.

Put a pint of split peas, and one bay leaf, with two quarts of cold water in a covered saucepan to boil for four hours; mash the peas thoroughly, strain them through a colander into a saucepan; set it, covered, over the fire to boil; mix one tablespoonful of flour with a cupful of soft butter, stir it into the boiling soup until it thickens; cover and boil five minutes or more. If the soup is too thick it may be thinned with boiling water. Season to taste. One pint of strained tomato added to this makes a very nice soup, of different flavor.

CREAM OF CELERY.

Cut the tops of one stalk of celery; simmer gently until tender in sufficient water to cover, with one teaspoonful salt. Cut up celery stocks in one inch pieces and boil in one pint of water until tender. Boil two tablespoonfuls rice in water until nearly done; then add to the celery soup to boil a few minutes; strain celery tops and add the liquor to the soup pot. Boil one quart of milk in double boiler; thicken with one scant tablespoonful of flour blended with one tablespoonful of butter; add another teaspoonful of salt; add this to soup and let boil but a second. Have ready one half cupful of whipped cream; place in the bottom of the tureen, pour on the hot soup, and serve with crackers.

WHITE SOUP.

Put in a saucepan one and one half pint of water; when boiling throw in the white part of a cauliflower separated into sprays, let boil twenty minutes; then add bread balls made thus:--to one pint of bread crumbs, add powdered marjoram, thyme, sweet savory and chopped parsley, to taste; one tablespoonful of melted butter, pinch of salt, a little whole wheat flour and beaten egg to bind; form into little balls, size of walnuts, and drop into the soup and boil ten minutes; then add one pint of rich milk or cream to soup, and let come to a boil. Grate in a bit of cheese, just enough to flavor delicately. Serve with croutons.

CREAM OF CORN.

To one can of corn add three pints of milk; boil for half an hour. To one tablespoonful of chopped onion, add two tablespoonfuls of butter and cook in frying pan until delicate brown, then add to onion and butter two tablespoonfuls of flour; blend. Stir this mixture into the corn and milk; add salt and pepper to taste; cook five minutes; then run through coarse sieve to strain, and stir in the well beaten yolks of two eggs and one quarter of a cupful of cream; return to double boiler and cook until it thickens; do not let it boil.

CORN CHOWDER.

Pare and slice one large potato and one onion; place in agate kettle a layer of onion; cover that with one cupful of corn; then add the sliced potatoes; add just enough water to cover, and let simmer gently until onion and potatoes are tender. Add one quart of rich milk, one third cupful of cream and let come to a boil. Remove from fire and stir in the whipped yolk of one egg, and add a tablespoonful of chopped parsley.

GREEN PEA SOUP.

Put a quart of freshly shelled, unwashed peas into a double boiler, steam until the peas can be thoroughly mashed, pour in a quart of boiling milk, let boil for one minute and strain it through a colander into a saucepan; mix two tablespoonfuls of flour smoothly with cold milk; stir it into the boiling soup until it thickens; add two tablespoonfuls of butter, set it covered on the range, to boil five minutes or more,--until the flour is cooked. Season to taste. A sprig of mint cooked with the peas gives a flavor liked by many.

CABBAGE SOUP.

Steam a whole cabbage with the stem end down, for two hours or more, set it off, covered, to cool; take off the coarse outer leaves, chop the cabbage very fine, put it into a saucepan with a cupful of butter, and season to taste. Set it over the fire for the butter to melt; then dredge in gradually four tablespoonfuls of flour; stir, to mix it with the butter and cabbage, pour in a quart or more of boiling milk, or water, stir until it thickens; cover it and boil five minutes or more, to cook the flour.

CAULIFLOWER SOUP.

May be made the same as cabbage soup; only substituting cauliflower for cabbage.

CREAM OF ASPARAGUS.

Cut off half inch tips from two bunches asparagus stalks. Cook the stalks until tender in boiling water. Rub through a colander, salt to taste; add three pints of boiling milk; smooth one teaspoonful of butter with one of flour and stir into the soup. Cook fifteen minutes; while this is in course of preparation boil the tips till tender, drain and put in tureen. When soup is done take from stove, add one half cupful of cream and pour over the tips. Serve with croutons.

SUMMER VEGETABLE SOUP.

Pare two medium sized onions and one turnip, place these with one cupful of finely chopped cabbage to cook in three quarts of boiling water. Season to taste with salt and cook till tender, then add one cupful of green corn, cut from cob, bring to a quick boil and cook five minutes, add one half cupful of cream just before serving.

BLACK BEAN SOUP.

Soak one quart of black beans over night; put them in a kettle with a gallon of cold water and two bay leaves; boil slowly until well done, rub through a colander, and return to the kettle; season with salt, white pepper, and, if liked, a little thyme; blend one tablespoonful of butter with one tablespoonful of flour and dissolve in one half cupful of warm water; stir into the soup. Serve with croutons.

CARROT SOUP.

Boil six carrots in water; when thoroughly done drain them and pass them through a fine sieve. Mix the pulp thus obtained with as much clear stock (water will answer, but the soup will not be so good) as will make it of the desired consistency. Add pepper, salt, and a pinch of sugar. Melt one ounce of butter and mix with it a tablespoonful of flour; then gradually add to the carrot purée; let it come to a boil, add a small piece of butter; serve with croutons.

MOCK TURTLE SOUP.

Boil a bay leaf and a scant cupful of lentils in salted water until tender. Mash through colander to remove husks. Put back in kettle and add water enough to make one quart of soup; blend one tablespoonful of butter with scant tablespoonful of flour and stir into the soup; let come to a boil. Just before serving add fine slices of lemon, and two sliced, hard boiled, eggs.

SCOTS BROTH.

Wash two ounces of barley; soak it for three hours; chop one half of a medium sized head of cabbage, and one onion, put over to boil with the soaked barley, in one quart of water; salt to taste. Let boil for two hours; adding more water if it becomes too thick, be careful not to add too much water; season with savory herbs, or soup powder; add a tablespoonful of butter, and serve with croutons.

WHITE TURNIP SOUP.

Peel and prepare turnips according to quantity of soup desired, put them over to cook in boiling water; when half done add one fifth as much of onions, chopped very fine, with pepper and salt to taste. When turnips are tender pour the liquid through a sieve and rub the turnips through with a spoon. Return to kettle and add as much milk as is required to bring soup to the proper consistency; add a little parsley, chopped fine; one cupful of cream, and one tablespoonful of butter blended with one teaspoonful of flour. Serve with croutons.

CREAM OF LIMA BEANS.

Soak one cupful of dried lima beans over night; in the morning drain and add three pints of cold water. Cook until tender and rub through a sieve. Cut two slices of onion and four slices of carrot into small cubes; cook in two tablespoonfuls of butter until yellow, add one cupful of cream or milk, two tablespoonfuls of butter, two tablespoonfuls of flour, one teaspoonful of salt, and one saltspoonful of pepper; and stir into the boiling soup. Strain and serve.

BEAN PURÉE WITH TOMATO.

To one pint of cold Boston baked beans, add one chopped, small, onion, one bay leaf, and one cupful of tomato; boil in one quart of water until tender, then mash through a colander, put back in kettle over the fire and add one tablespoonful of butter blended with one teaspoonful of flour; season to taste, let come to a boil, and serve with croutons.

SAVORIES AND RELISHES.

SAVORY HASH.

Take one third of brown lentils (which have been cooked tender and rubbed through colander) to two thirds of chopped cold boiled potatoes, add one cupful of bread crumbs over which has been poured one tablespoonful of melted butter. Season, adding savory, soup powder or sage and chopped onion, as preferred; put tablespoonful of butter in frying pan, add the hash, cover until thoroughly heated, then remove cover and let brown, turn out on platter garnished with parsley.

NUT LOAF.

Grind or chop very fine one half pound of nuts--any kind you prefer; add one pound of broken bread, one fourth pound of butter; turn on one pint of boiling water and one egg, well beaten, salt, pepper, and sage to taste; chop very fine. Butter a pudding dish, cover the buttered surface with bread crumbs, pour in the mixture, and bake one hour or until well done. Turn out on a platter, garnish with parsley or celery tops. Serve with cranberry sauce.

VEGETABLE SWEET BREADS.

To six tablespoonfuls of lentils, previously boiled in salted water until tender and mashed through a colander, add three tablespoonfuls of bread crumbs and two beaten eggs, mix well together and fry by tablespoonfuls in plenty of hot butter. Serve hot, with green peas.

STUFFED SQUASH.

Boil or steam, a good sized summer squash, it needs to be of tender skin, leave on the skin and cut it once across before putting on to cook; let it cook until tender, be careful not to break in taking up; scoop out the seeds with a spoon, have ready some bread crumbs in which have been mixed one tablespoonful of melted butter and tablespoonful of finely minced onion and an equal quantity of chopped parsley or mint, as you prefer, with salt and pepper to taste; fill the cavity in squash with this stuffing and fasten together. Place in the oven and bake one half hour, basting frequently with butter and hot water.

STUFFED CUCUMBERS.

Take three medium sized cucumbers, pare, remove the seed centers and fill with stuffing. Bind the halves together with tape and steam until tender; remove all tapes, but one, that through the middle, lay them in a baking dish and brush them over with egg; then scatter fine bread crumbs and brown. Serve in long dish, with brown gravy.

The stuffing is made as follows: Put one tablespoonful of melted butter in stew pan, fry in the butter until brown one onion and two medium sized apples chopped fine. Drain from the fat and make into stuffing with bread crumbs flavored with a little mint, savory, or sage, as one prefers; whip one egg and stir in, with seasoning to taste.

VEGETABLE CUTLETS.

Use as a basis the vegetables from which the clear soup stock is made; after they have been thoroughly drained, set away, and chilled they will chop nicely without mushing. To the quantity of vegetables used for one gallon of soup stock, add one half can of peas, and one quart of chopped, cold, boiled potatoes; pepper and salt to taste. Mould in flat cutlet shapes, dip in fine bread crumbs, then in egg, again in bread crumbs, and fry in hot oil or butter. Serve hot. This will make about four dozen cutlets. If the chopped vegetables are placed in a cool place they will keep nicely several days.

CELERY ON TOAST.

After washing and removing green leaves, cut celery stocks into pieces about four inches long and cook in boiling, salted, water; when tender, lay on buttered toast, moistened with the water the celery was cooked in; add a brown sauce, and serve.

TURNIP SOUFFLÉ.

Make a white sauce of three tablespoonfuls of butter, three of flour, and enough milk to make a thick, white sauce; use three cupfuls of strained cooked turnip, whites of three well beaten eggs, a teaspoonful finely chopped onion; salt, and a dash of cayenne; mix all together, adding the whites of eggs last folding them carefully in, bake in a well buttered pan in slow oven until a delicate brown.

FARINA CROUSTADES.

Put one quart of water in double boiler and add one teaspoonful of salt; when scalding hot stir in gradually one and one half cupful of farina; let it cook till very thick; then spread out on a flat buttered dish about one and one half inches thick; when perfectly cold cut with a round cutter and scoop out some of the center so as to make a sort of cup; brush over with the yolk of egg and set in oven till a delicate brown.

For filling, cut into dice, three hard boiled eggs, season with salt, cayenne, and chopped parsley; add two tablespoonfuls of mushrooms cut in half; mix with enough well seasoned brown sauce to moisten well; fill the little croustades and serve; pass more of the filling or sauce in a gravy boat.

RICE CROQUETTES.

One cupful of rice, boiled in one pint of milk and one of water until tender. While boiling, add butter the size of an egg, two teaspoonfuls of sugar, three eggs, and the juice and grated peel of one lemon. Mix well, make into rolls a finger long, and dip first into yolks of two eggs, well beaten, then into cracker crumbs, and fry in hot cocoanut butter.

ITALIAN MACARONI.

Boil one third of a package of macaroni in salted water until tender, drain and rinse in cold water; heat and cover with tomato sauce (see sauces and gravies).

MACARONI PIE.

Boil a quarter of a pound of macaroni in water until quite soft; pour off the water; add half a pint of milk, a quarter of a pound of grated cheese, a piece of butter, a very little mustard, salt, a pinch of cayenne, and a dust of white pepper. Let it boil for a minute, then bake in a dish lined with rich crust. The crust should be brushed with the white of egg to keep it dry.

MACARONI CHEESE.

Take the quantity of macaroni required to fill a baking dish two thirds full, and boil until tender in salted water, drain through a colander and rinse in cold water, place in baking dish with half a cupful of milk if quantity used is small, a whole cupful if two quart dish is to be filled, add cupful of grated cheese, pinch of soda and dash of cayenne; bake a delicate brown.

VEGETABLE HOT-POT.

Use one turnip, one Spanish onion, one cupful of stewed tomato, one and one half pound of potatoes; one half cupful of tapioca previously soaked, butter, pepper, and salt to taste. Cut turnip into dice and boil until tender, at the same time let tapioca cook clear. Cut potatoes up fine, and chop onion fine and scald. Place a layer of onion at bottom of buttered baking dish, then tapioca, on top of this, potatoes, chopped turnip, and tomato,--with a little butter on each layer; repeat this until the dish is full, and have a layer of potatoes at the top. Bake in hot oven for one hour, the last quarter remove cover; add layer of bread crumbs and brown.

WINTER VEGETABLE PIE.

Place in baking dish, slices of cold boiled potatoes, onions, celery, and carrot, then add one scant cupful of stewed tomatoes and one half can of peas. Cover with stock, thickened to a gravy with butter and flour, cover with plain crust, and bake. A pie of this nature can be made with a great variety of ingredients; apples, boiled chestnuts, onions, and potatoes make a good combination. Rice, with a grating of cheese, celery, onion, and tomato, another variety.

VEGETABLE HASH.

Of cooked and chopped vegetables, use one carrot, one blood beet, two turnips, two quarts of finely sliced potatoes, one onion, and a stalk of celery; one sprig of parsley; put them in a stew pan, cover tight, and set in the oven. When thoroughly heated pour over a gravy of drawn butter and cream. Stir together and serve.

NUT CROQUETTES.

Shell and grind one pound of English walnuts, add one teaspoonful of salt, and the juice of half a lemon, one tablespoonful of chopped parsley, a dash of cayenne pepper; mix thoroughly. Place one cupful of milk in double boiler; rub one tablespoonful of softened butter with two tablespoonfuls of flour; when the cream is hot, stir in the flour and butter; cook until it thickens; season lightly.

Then turn the thickened cream into the nut mixture; have ready a well beaten egg and whip in; mix all together thoroughly. Set away to cool; when cold form into shapely rolls, dip in bread crumbs, then in beaten egg, again in bread crumbs, and fry quickly in hot fat. Be sure the fat is at right temperature,--see “Important Notes.”

BISCUIT PATES.

Make a nice light baking powder biscuit. Have ready, when the biscuits are done, one cupful of small mushrooms cooked tender and cut fine, dressed with one half cupful of cream, mixed with juice of mushrooms, and thickened with one teaspoonful of flour,

blended with teaspoonful of butter; season to taste with salt and pepper. Take a thin slice off of the bottom of the biscuit, dig out the center, leaving reasonably thick walls, put little piece of butter in the shell and fill with mushrooms dressing; serve at once. Stale biscuit may be used by toasting them a few minutes in a hot oven after they have been hollowed out. These are crisp and some prefer them to fresh biscuit.

YORKSHIRE PUDDING.

To six large tablespoonfuls of flour, add one teaspoonful of baking powder and one half teaspoonful of salt; sift thoroughly; beat the yolks of three eggs, and add milk enough to mix with flour and make the consistency of soft custard; whip whites of eggs to stiff froth and fold into mixture lightly. Melt a heaping tablespoonful of butter in dripping pan, letting it brown slightly; pour in the mixture and place in oven; then pour over the top a half cupful of melted butter; brown another spoonful of butter, and when pudding is almost done baste with browned butter. When done cut in squares and serve with melted butter.

FRIED APPLES.

Wash apples and dry them, cut in circular slices through the core of the apples. Sprinkle liberally with sugar and fry in butter until well cooked. Serve on a platter.

VEGETABLE SAUSAGES NO. 1.

Take three cupfuls of grated bread crumbs and moisten with hot water; add salt, pepper, and mixed herbs. Beat till light, one egg and add to bind. Shape in small cakes, or rolls, and fry in hot grease.

SAUSAGES NO. 2.

Take one cupful of boiled, or Boston baked, beans; heat, and mash through sieve; chop two onions and boil very tender, mash, and add to beans. Place in oven one cupful of bread crumbs and let them dry and brown, then roll to powder; add to the mixture, bind with an egg, and use savory or sage to flavor, with salt and pepper to season. Roll in shape, dip in wheat meal, and brown in hot butter or oil.

CHINESE RICE.

Wash rice thoroughly, have agate kettle half filled with boiling salted water. Sprinkle rice in the boiling water; let cook until rice is thoroughly tender; then drain through a sieve.

CURRIED RICE WITH EGGS.

Prepare Chinese rice and serve with curried gravy made as follows: Put one teaspoonful of chopped onion in frying pan, with one heaping tablespoonful of butter; thicken with browned flour and add sufficient water to make gravy of right consistency. Season with salt, pepper, and curry powder enough to delicately flavor. Heap rice in center of shallow dish or platter, pour the gravy around the edge of rice, garnish with slices of hard boiled eggs, and lemon.

BANANA FRITTERS.

Slice bananas one half inch thick; squeeze over the slices some orange juice; stand for fifteen minutes; drain each piece, dip in fritter batter and fry.

CURRIED RICE.

Thoroughly wash one cupful of rice; let soak several hours in cold water; put two tablespoonfuls of butter in saucepan; add one teaspoonful finely chopped onion; when the onion begins to color drain the rice and add to onion and butter; stir a few minutes; add two teaspoonfuls curry powder, salt and pepper; then add two and one half cupfuls of boiling water; cover and cook rapidly for ten minutes; then move where it will cook very slowly three quarters of an hour.

IRISH STEW.

Chop fine a small onion, put over to stew in one pint of water; add a bay leaf and half a teaspoonful of salt; let simmer until onion is tender, take out the bay leaf; add pint of milk and one large potato, pared and sliced thickly; let simmer until potato is tender, then add one spoonful of flour blended with half a teacupful of butter; add chopped three hard boiled eggs, pour over split baking powder biscuit and serve on a platter, garnished with parsley.

CHESTNUT CROQUETTES.

Boil one quart of the large French chestnuts; remove the shells and thin brown skin; mash and run through a sieve; put into a double boiler, add enough sugar to sweeten, about two tablespoonfuls, the grated peel of one orange and juice of one half of a lemon, one tablespoonful of finely chopped citron; beat the yolk of one egg with one tablespoonful of cream; add to the chestnuts; turn out and when perfectly cold, form into croquettes; dip in egg, then in bread crumbs or fine cake crumbs may be used; fry in deep hot fat.

For the sauce, put into a double boiler one half cupful of thick cream, three fourths cupful of strong coffee, three tablespoonfuls of sugar and the yolks of four eggs well beaten; stir till it begins to thicken, remove from the fire; add juice of one half an orange, one tablespoonful of lemon juice, three teaspoonfuls Maraschino; serve with the croquettes.

MUSHROOMS.

GRILLED MUSHROOMS.

Prepared in this way the mushrooms must be large. After washing and peeling, score the tops with a knife and lay them for one hour in a pickle of oil, salt, pepper and lemon juice. Place them, tops down, on a close-barred gridiron and broil over a clear, slow fire. Serve on toast with a sauce made as follows:

Chop the stalks and pieces of mushrooms that have broken in the washing and stew in broth for ten minutes with a little minced parsley and onion. Beat the yolk of one egg with a gill of cream and add slowly to the sauce. Stir the whole until hot without boiling and pour it over the toast.

ESCALOPED MUSHROOMS.

Put the mushrooms in a buttered baking-dish with alternate layers of crumbs, seasoning each layer plentifully with butter; add salt, pepper and a gill of cream or gravy. Bake twenty minutes, keeping covered while in the oven.

MUSHROOM PIE.

Line a baking dish with rich crust. Drain the liquor from a can of small mushrooms, slice the mushrooms, add one cupful of cream, or rich milk, and tablespoonful of butter, to juice of mushrooms. Season to taste and thicken with tablespoonful of flour blended with butter; add the mushrooms, fill in the baking dish, cover with top crust and bake a rich brown. Brown sauce may be used if preferred.

AUNT SUSAN’S MUSHROOM PIE.

Line a deep pudding pan with rich paste; fill two thirds full of mushrooms (if raw they must be stewed a few minutes first), make a gravy of flour rubbed very smooth with thick cream, or with butter and milk, thin with boiling water, season with salt, pepper and soup powder, pour over the mushrooms, cover with paste and bake.

BAKED MUSHROOMS.

Toast for each person a large slice of bread and spread over with rich sweet cream; lay on each slice, head downward, a mushroom, or if small, more than one; season and fill each with as much cream as it will hold. Place over each a custard cup, pressing well down to the toast; set in a moderate oven and cook fifteen minutes. Do not remove the cups for five minutes after they come from the oven, as thereby the flavor of the mushroom is preserved in its entirety.

STEWED MUSHROOMS.

Drain off the juice from a can of small mushrooms; put a heaping tablespoonful of butter into a frying pan; add two tablespoonfuls of flour and brown well, stirring all the time; then pour in the juice of mushrooms with water enough to make a thin gravy; season with salt, pepper, and soup powder; add mushrooms and stew a few minutes, then serve.

MUSHROOMS IN WHITE SAUCE.

For stewing, the smaller mushrooms are preferable. Carefully peel the tops, cut the ends of the stalks level, wash and drain in colander. They should be stewed, till tender, in as little water as possible. When thoroughly cooked, add a pint of cream, or new milk, and thicken in usual way with flour blended in melted butter.

MUSHROOMS WITH LEMON.

Use the small canned mushrooms, separate the mushrooms from the liquor, put them, with one tablespoonful of butter in saucepan; add one tablespoonful of lemon juice, a pinch of white pepper, and one quarter of a teaspoonful of salt; place the saucepan over a slow fire and cook gently fifteen minutes, then serve.

EGGS.

CURRIED EGGS, NO. 1.

Put into saucepan two tablespoonfuls of butter, add one half teaspoonful onion juice; cook slowly till the onion begins to color; then add one tablespoonful flour and one teaspoonful curry powder; when perfectly smooth add three fourths of a cupful of clear stock and one half cupful of cream; cook for five minutes, stirring constantly; season with salt and pepper. Cut six hard boiled eggs into halves lengthwise; strain the sauce over them and let stand on the stove a few minutes till thoroughly heated. Serve on thin squares of toast.

CURRIED EGGS, NO. 2.

Boil half a dozen eggs hard and let them get cold. Fry in butter two large onions cut in thin slices, and let them get quite brown, season these with pepper and salt, and add a pint of boiling water; when the onions have stewed for a little while, put in a cupful of milk thickened with arrowroot, or flour, and flavor with curry powder, let it simmer, then put in the eggs cut in halves, making them hot, but do not let them boil. The amount of curry powder used is a matter of taste; garnish the dish with boiled rice, and serve very hot.

BAKED EGGS.

Butter gem pans and line with fine, buttered, bread crumbs. Break one egg carefully into each pan, season with bits of pepper, salt and butter, cover lightly with buttered bread crumbs, and bake in oven until delicate brown.

SCRAMBLED EGGS.

Break the eggs into a bowl and beat moderately light; add cream in proportion of one tablespoonful to every two eggs; season to taste. Have one tablespoonful of butter melted in hot frying pan and pour into the mixture. Stir until cooked solid, turn on hot platter and serve at once with toast.

SHIRRED EGGS.

Set a saucer on the stove--the heavy japanese ware stands the heat best--and put in it a teaspoonful of butter, when hot break two eggs into the dish, let cook until they bubble, and begin to set. Serve in the dish in which they are cooked, slipping the saucer on to a small plate. Serve at once.

HARD BOILED EGGS.

The eggs should be placed in boiling water, then set where they will simmer, rather than boil, and be left for fifteen minutes; the yolks will be dry and fine. To make them peel easily slip at once into cold water on removing from the fire.

LYONAISE EGGS.

Put one half tablespoonful butter in sauce pan, add one teaspoonful onion juice, cook slowly five minutes. Add one tablespoonful flour and, when well mixed, add one and one half cupfuls milk, stir till it thickens, season with salt and pepper, pour the sauce in a bake-dish, and break six eggs onto the sauce. Sprinkle quite thickly with bread crumbs, put bits of butter over all, and set in the oven for three or four minutes.

EGGS WITH MUSHROOMS.

Trim and peel the mushrooms; put them in stew-pan with butter, and cook until tender, season to taste. Place in shallow dish pouring the butter over them, then break over them eggs enough to cover, sprinkle thickly with bread crumbs and add bits of butter, place in hot oven long enough to set the eggs. Do not let the eggs harden; four or five minutes is the time usually required. Serve at once.

SAVORY EGGS.

Fry slices of Spanish onions until a delicate brown; add a tablespoonful of chopped parsley, pepper and salt, blend fat with tablespoonful of flour; add a pint of hot milk. Have ready some hard boiled eggs, quarter, and heat in the prepared sauce. Serve on toast.

FRICASSEED EGGS.

Boil the eggs till hard, take them out of the shells and arrange on a platter either in halves, or the yolks whole and whites cut in dice; make a rich white sauce and pour over them, garnish the dish with parsley.

EGGS FORCED.

Boil the number of eggs required; throw into cold water to chill; peel, and cut crosswise, take out the yolks, being careful not to break the whites. Rub the yolks with tablespoonful of butter (if six eggs are used), add two tablespoonfuls of cooked, chopped, mushrooms, pepper, salt, and one tablespoonful of chopped parsley; heat this mixture and beat it to a paste. Stuff with it the whites of the eggs and serve cold on bed of cress.

EGG CUTLETS.

For each cutlet allow one hard boiled egg, chopped fine, a tablespoonful of bread crumbs, the same quantity of grated cheese, a pinch of curry powder, pepper and salt; mix the whole with the beaten yolk of a raw egg and shape like cutlet; dip in white of egg and bread crumbs and fry brown; serve very hot.

ROASTED EGGS.

Fresh eggs well roasted are considered by some to be much richer than boiled eggs. Eggs may be roasted in the oven or in hot ashes. Care should be taken to turn them, where the heat is unequal.

EGGS IN CREAM.

Put half a cupful, or more, of cream into a shallow earthen dish, and place the dish in pan of boiling water. When the cream is hot, break in as many eggs as the bottom of the dish will hold, and cook until well set, basting them occasionally over the top with the hot cream, season to taste, and serve promptly.

ESCALOPED EGGS.

Boil six eggs fifteen minutes, the water should simmer, rather than boil; then slip the eggs into cold water for a moment, to make them peel easily, remove the shells and set aside to cool. Make a white sauce of rich milk thickened with butter and flour, seasoned to taste. Remove the whites of eggs and chop; cream the yolks with one half cupful of cream and add to white sauce. Stir in the chopped up whites, and add a teaspoonful of chopped parsley; place in baking dish, sprinkle bread crumbs and bits of butter over the top and set in hot oven just long enough to brown delicately.

POACHED EGGS, SPANISH STYLE.

Heat an earthen pan slowly and melt in it a tablespoonful of butter; add a teaspoonful of salt, a smaller quantity of pepper and a small onion minced very fine; or in place of the onion, use parsley, and sweet herbs, or a combination of all together as you prefer. Drop in the eggs one at a time; do not stir, but let them brown a little; turn carefully and brown on the other side. In Spain and Mexico they are served in the dish in which they are cooked, and as hot as possible.

SWISS EGGS.

Cover the bottom of a dish with two ounces of fresh butter and on this scatter grated cheese; drop the eggs upon the cheese without breaking the yolks, season to taste. Pour over the eggs a little cream and sprinkle with about two ounces of grated cheese; set in a moderate oven for ten or fifteen minutes.

FRENCH OMELET (PLAIN).

Beat the yolks of six eggs to a cream, and beat whites to a stiff froth, add two tablespoonfuls of cream, or rich milk, to the yolks, season to taste, whip in the beaten whites lightly. Have omelet pan well oiled with butter and moderately hot; cook slowly until browned slightly on the bottom, then set pan in upper grate in hot oven. Serve on a platter garnished with parsley.

DRESSED OMELETS.

A nice variety can be given omelets by filling supplied just before folding.

TOMATO DRESSING.

Five tomatoes stewed down, and seasoned with salt, pepper and butter. Spread on omelet just before folding.

OMELET, WITH FRENCH PEAS.

Heat and drain one can of peas, season with salt, pepper and butter. Cover the platter and serve omelet on peas.

MUSHROOM FILLING.

If fresh mushrooms are used, select the small variety; peel and slice them, stew until tender in butter; season to taste and spread on omelet before folding.

FOAMY OMELET (SWEET).

Beat the yolks of six eggs to a cream, add one half cupful of cream, one tablespoonful of sugar. Whip the whites to a stiff froth, and add one half to the mixture; have frying pan moderately hot, melt one teaspoonful of butter in pan; be careful not to brown, and pour in the mixture. Cook carefully, lifting pan from fire frequently so it will not scorch on the bottom; when nearly set, pour over the rest of whites of eggs, and sprinkle with powdered sugar, then set in oven until whites of eggs set; have ready a hot platter, slip omelet on to platter, lay spoonfuls of jelly on omelet and double quickly. Serve at once. This omelet without sweetening is very nice with savory dressing, such as minced herbs heated in butter.

BREAD OMELET.

Crumble a cupful of stale bread and soak in half a teacupful of milk. Then beat quite smooth, and add half a teaspoonful of salt and five beaten eggs. Butter a shallow pudding dish well, pour in the mixture, and bake in an oven about ten minutes, serving at once in the same dish, as it falls quickly.

VEGETABLE OMELET.

Chop an onion finely, together with two crisp heads of lettuce, season with salt and pepper, and stir in six well beaten eggs, add three tablespoonfuls of cream. Pour into hot, buttered spider, and when thickened, but not hardened, fold over and serve on hot platter. Parsley may be used, if preferred, in place of lettuce.

CHEESE OMELET, NO. 1.

Break three eggs into a basin; whip them till well mixed; add pepper and salt, and two ounces of grated cheese; melt one tablespoonful of butter in frying pan; when the butter is quite hot pour the mixture into the pan; as soon as it begins to set, draw the thickening portion from the bottom of pan with a silver fork, letting the liquid substance cover the pan, do not stir; repeat this operation until it is all sufficiently cooked; then turn onto a heated platter, garnished with parsley, or cress.

CHEESE OMELET, NO. 2.

Mix to a smooth batter three tablespoonfuls of flour with half a pint of milk. Beat together four eggs, a little salt and one fourth of a pound of old cheese grated. Add these to the flour and milk and mix all, beating briskly for several minutes. Put three ounces of butter on a frying pan, and when it is boiling hot pour in the mixture and cook to a nice brown on both sides, turning carefully. Serve on a hot dish.

EGG AND ASPARAGUS.

Cut about two dozen stalks of asparagus into inch lengths and boil tender. Drain, pour over a cupful of drawn butter; stir until hot, turn into a baking dish. Break about six eggs on top, put a bit of butter on each, with salt, and pepper; put into a quick oven until the eggs are “set.”

DEVILLED EGGS.

Boil the eggs for twenty minutes, remove the shells, cut each egg in half without breaking the whites; take out the yolks and pound them in a mortar, adding cayenne, salt and curry powder. Stuff the whites with this paste and join the eggs to their original shape. Cut off just sufficient of each broad end to enable them to stand, and arrange them thus on a dish in a bed of cress or parsley.

EGGS ON TOAST.

Put one tablespoonful of butter in a chaffing dish, and when bubbling add one tablespoonful of flour, one half teaspoonful of salt, one half saltspoonful of pepper, and, gradually, one cupful of milk. Add the whites of three hard boiled eggs, chopped fine. When hot, pour over three slices of toast. Rub the yolks through a strainer over all and garnish with parsley.

SAVORY SAUCES AND GRAVIES.

Nut butter is an excellent substitute for meat essence in gravies, stocks, and sauces. It should be used in the proportion of one tablespoonful to one quart of water.

BROWN SAUCE.

Heat a pint of thin cream; when boiling add a tablespoonful of flour, browned in the oven and rubbed to a smooth paste with a little cold milk; salt to taste; cook thoroughly for ten minutes; then add one cupful of hot, stewed, strained tomato. Beat thoroughly.

TOMATO SAUCE, NO. 1.

Melt one tablespoonful butter, add one tablespoonful of chopped onion, fry until delicate brown; then add one tablespoonful of flour; gradually pour in one cupful of clear soup stock and one half cupful of strained juice of tomato. Season to taste, and cook until it thickens. Nut or dairy butter may be used.

TOMATO SAUCE, NO. 2.

Put one half can of tomatoes, one cupful of water, two cloves, two allspice berries, two pepper corns, two sprigs of parsley, one teaspoonful of mixed herbs, over to boil in granite saucepan; fry one tablespoonful of chopped onion in one tablespoonful of butter till a delicate brown; then add tomato mixture and one heaping tablespoonful of corn starch that has been dissolved in cold water. Simmer ten minutes, add one half teaspoonful of salt, and one half saltspoonful of pepper, add a dash of cayenne, if liked. Strain.

WHITE SAUCE.

To one pint of milk add one heaping tablespoonful of flour blended with one tablespoonful of melted butter; boil until it thickens, salt to taste, add one half cupful of cream. If too thick, thin with hot milk.

CHEESE SAUCE.

Flavor white sauce by adding grated cheese, and stir until the cheese is quite melted.

DUTCH SAUCE.

To four ounces of butter add the well beaten yolks of three eggs, a teaspoonful of flour, a dessertspoonful of lemon juice and salt to taste; put in double boiler and stir gently until it thickens; do not let it boil or it will curdle. This sauce is very nice with asparagus or cauliflower.

DRAWN BUTTER.

One half cupful of butter, rubbed well with two tablespoonfuls of flour; put into saucepan with about one pint of boiling water, stir constantly until well melted. Add one tablespoonful of chopped parsley.

BUTTER SAUCE.

Season a cupful of flour with pepper, nutmeg, and cloves. Mix it with water into a thin paste, and work in a piece of butter about the size of an egg. Put the paste into a pan over the fire, and boil it for a quarter of an hour, then take it off, and add some fresh butter in small portions at a time, continually stirring the contents, to prevent the butter from rising to the surface. Afterwards add lemon juice to flavor, and mix thoroughly. This sauce may be used with almost any vegetable. Another way of making butter sauce sometimes called oiled butter, which is generally liked, is to take as much fresh butter as will be wanted, and melt it, but do not let it brown. Skim it, pour it out, let it rest a minute, then drain it from the curd at the bottom, and serve.

BROWN BUTTER GRAVY.

Take one bay leaf, and a teaspoonful of chopped onion and simmer fifteen minutes in one pint of water. Brown two tablespoonfuls of flour. Put one heaping tablespoonful of butter in frying-pan, melt, browning slightly, add flour, then the strained water that is flavored with onion and bay leaf; let boil, if too thick add more hot water. Salt and pepper to taste.

CHEESE DISHES.

AN ENGLISH MONKEY.

Soak one cupful of bread crumbs in one cupful of milk about ten or fifteen minutes. Melt one tablespoonful of butter, add one cupful of cheese broken into small pieces; stir until melted; add the crumbs and one beaten egg, one half teaspoonful of salt, a few grains of cayenne, and a piece of bicarbonate of soda as large as a pea. Cook for five minutes; serve on wafers.

RICE AND CHEESE.

Take one pint of boiled rice and one cupful of grated cheese; add to the cheese a dash of cayenne pepper and soda the size of a small pea; mix thoroughly. Place the rice and cheese in alternate layers in buttered baking dish. Sprinkle bits of butter over the top and bake in hot oven until brown.

WELSH RAREBIT.

Take one fourth pound of good rich cheese, grate it, add one half cupful of milk; put in a double boiler. Mix one half teaspoonful mustard, one saltspoonful of salt, a sprinkle of cayenne pepper and soda the size of a small pea, to a smooth paste with a little milk; add the yolks of two eggs, and beat well. When the cheese is melted stir in mixture of egg and seasoning, add two teaspoonfuls of butter, and cook until it thickens, stirring constantly. Pour over toast, or heated square crackers and serve at once.

CHEESE PUDDING.

Grate one half pound of cheese and add a dash of cayenne, and soda the size of a pea; add six ounces of grated bread, using crust and all; mix with pepper and salt to taste, melt two ounces of butter in one gill of boiling milk and pour over the mixture (cook in double boiler and stir until cheese is melted), then beat in the yolks of three eggs, beat whites of eggs stiff and add them to the mixture (after it is set off of the stove), then pour into a greased pudding dish and bake in moderately hot oven.

CHEESE STRAWS.

Sift one cupful of flour, one half teaspoonful of baking powder, a dash of cayenne pepper, and salt thoroughly. Then work in two tablespoonfuls butter, add three fourths of a cupful of grated cheese and mix to a soft dough with milk. Roll out lightly on a floured board, cut in strips the length of a pencil, also make some small rings. Bake in a hot oven until delicate brown. Put sticks through one or two of the rings. Nice to serve with salads, or for lunch boxes.

ESCALOPED POTATOES, WITH CHEESE.

Slice cold boiled potatoes and sprinkle with salt and pepper; prepare a good cream sauce; put a layer of sauce, then one of potato into a shallow bake dish, having the last layer of sauce; cut some thin strips of cheese about two and one half inches long, lay them on top of the potatoes, sprinkle with bread crumbs, put into a good oven till slightly browned and the cheese is somewhat melted.

CHEESE PATÉS, NO. 1.

Make a good short crust, roll it out very thin and line as many patty pans as will be required; fill them with stale bread crumbs, or dry rice. Cover with crust and bake in a quick oven. When cooked, remove the lid and take out the bread, or rice; fill up the case with cheese mixture; brush round the edge with egg and cover with the lid. Serve very hot.

Cheese Mixture.--Grate one half pound of good rich cheese, add a dash of cayenne pepper and a tiny speck of soda, mix with white sauce to the consistency of cream, stir over the fire until the mixture is thick, remove from stove, and add one well beaten yolk of egg. Fill the cases while hot and serve at once.

CHEESE PATÉS, NO. 2.

Cut rounds of bread two and one half inches thick and with a sharp knife or smaller cutter cut the center nearly through; spread all over with soft butter, put into a quick oven till a delicate brown, grate enough dry cheese to make one large cupful; season with salt, cayenne and a very little dry mustard; moisten with cream and stock till you have a smooth paste, adding a few drops of onion juice; fill the centers of the bread rounds; the cheese must not be too soft; put in a quick oven till cheese is melted, then draw to the edge of the oven; put a spoonful of beaten white of egg on top of each center, let color for a moment and serve.

CHEESE RELISH.

Fill a baking dish with alternate layers of grated cheese, in which you have mixed a tiny speck of soda, a dash of cayenne pepper, and bread crumbs, placing crumbs in bottom of dish. When filled, pour over it rich milk, or cream, in proportion of one half pint to each cupful of crumbs. Salt to taste and bake for twenty minutes in a reasonably hot oven.

CHEESE PUFF.

Butter liberally two slices of bread and place one in bottom of baking dish; grate one fourth pound of cheese and sprinkle half of it over the buttered bread with a little salt, a dash of cayenne pepper, and soda the size of a pea; then add another slice of buttered bread and the rest of the grated cheese; season as before; whip two eggs to a froth and beat into one pint of milk; pour it over the bread and cheese mixture and bake a delicate brown; serve hot.

CHEESE WAFERS.

Take a quarter of a pound each of flour, butter, and grated cheese; mix them thoroughly with one quarter of a saltspoonful of cayenne pepper. Mix with yolk of egg and water to a smooth stiff paste; roll this out to the thickness of half an inch, then cut into pieces about three inches long and one inch wide. Bake these until they are lightly browned, and serve them as hot as possible.

CHEESE CUSTARDS.

Six tablespoonfuls of grated cheese, two of butter, four eggs, one cupful of milk with a teaspoonful of corn starch stirred into it, salt and pepper to taste. Beat the eggs very light and pour upon them the heated milk (with a pinch of soda), having thickened with the corn starch. While warm add butter, pepper, salt and cheese. Beat well and pour into greased custard-cups. Bake in a quick oven about fifteen minutes, or until high and brown. Serve at once, as a separate course, with bread and butter, after soup, or before serving dessert.

SALAD DRESSINGS, AND SALADS.

CREAM DRESSING.

To one pint of boiling cream, add two ounces of flour, stirred to a smooth paste with two ounces of butter; cook two minutes. Remove from sauce pan and add one ounce more of butter, stirring until cool and perfectly mixed; then season to taste with lemon juice, salt, pepper, and mustard (blending the mustard first in a little lemon juice). Add sliced olives; or, if preferred, use one tablespoonful of chopped parsley and one half teaspoonful of finely chopped onion; the olives are best with cabbage, and onion and parsley with mixed salads.

PLAIN DRESSING.

Beat one egg very light; add one tablespoonful of vinegar and cook in double boiler until thick; place one tablespoonful of butter in a bowl and pour the hot custard over it; beat until smooth, then add mustard and salt to taste--one half teaspoonful of mustard, and saltspoonful of salt is the usual proportion,--with half a teaspoonful of sugar to blend. Set away to cool. Just before using, add sufficient sweet cream to thin to the consistency of rich cream.

MAYONAISE DRESSING.

To the yolks of two eggs add a scant teaspoonful of mustard, equal quantity of salt, and a dash of cayenne pepper, stir, then add, very slowly almost drop by drop, one teacupful of olive oil. The mixture should be as thick as butter, then add one tablespoonful of lemon juice, if too thick, thin with sweet cream. For cabbage or potato salads it is well to add one half cup of sweet cream, while for tomato, aspic or plain, no cream should be used.

FRENCH DRESSING.

Mix one half teaspoonful of salt, with one half saltspoonful of pepper and two tablespoonfuls of lemon juice; then add slowly, stirring briskly, one half cupful of oil. Very nice for plain salads.

COOKED SALAD DRESSING.

Mix one tablespoonful of sugar, one teaspoonful of mustard, one teaspoonful of salt, a speck of cayenne and the yolk of one egg; add two tablespoonfuls of melted butter and one half cupful of milk. Stir over boiling water until it thickens. Take from the fire and add the beaten white of the egg and two tablespoonfuls of lemon juice.

AUNT SUSAN'S SALAD DRESSING.

Beat together one level teaspoonful of mustard, one heaping teaspoonful of sugar, one dessertspoonful of melted butter, one half teaspoonful of salt and the yolk of one egg; add one cupful of milk and cook in double boiler until it thickens; stirring all the while. When thick add lemon juice or vinegar to taste. This dressing can be kept any length of time by bottling, not necessary to seal.

SALAD CREAM.

Heat one half cupful of vinegar and one half cupful of sugar. When very hot add one half cupful of sour cream into which the yolks of two eggs have been beaten. Stir well, remove from the fire and then chill before using.

Very nice on cabbage salad.

SPRING SALAD.

In a salad bowl put a layer of fresh watercress, then a layer of thinly sliced cucumbers, then a layer of tomatoes with a teaspoonful of chopped chives. Repeat the process and put a border of watercress round the bowl. When ready to serve pour on a French dressing and toss until well mingled.

STUFFED TOMATO SALAD.

Select good sized, smooth, solid tomatoes, scald and skin quickly, slip into ice-water to chill, then carefully remove center without breaking under part; remove seed pulp with your finger, then fill with a chopped mixture of onion, cucumber, parsley, and cress; cover with mayonaise dressing and serve on platter garnished with lettuce leaves, or parsley. One should use judgment in regard to any mixture given in receipt of this nature, and omit any article not pleasing to individual tastes, for instance some prefer to omit parsley, others do not like onion, etc.

PLAIN TOMATO SALAD.

Choose smooth round medium sized tomatoes, scald, and skin quickly. Set away to chill, serve on lettuce leaves with thick mayonaise dressing.

TOMATO ASPIC.

To one quart of strained tomato juice, add one bay leaf, one teaspoonful of chopped onion, and one teaspoonful of salt; let boil ten minutes, strain through fine sieve, or cheese cloth. Set back on stove and thicken with two or more tablespoonfuls of cornstarch, previously dissolved in one third cup of cold water; let boil until clear, turn into wet mould, and set away to chill. Serve on lettuce leaves with thick mayonaise dressing.

SUMMER SALAD.

Take two small heads of nice tender lettuce; tear, do not cut, add one pint of wax or string beans, that have been cooked till tender. Add one medium sized cucumber, sliced thin, and one young onion, two hard boiled eggs, sliced, add a dash of cayenne pepper, cover with mayonaise or French dressing.

ITALIAN SALAD.

Select two small heads of crisp tender lettuce, wash carefully; pare and slice one medium sized cucumber; cut fine one third cupful of parsley; wash one bunch of water cress; clean six crisp round radishes but do not pare, slice thin; slice very thin as much onion as suits your taste, mix all together and dress with oil, lemon juice, salt and cayenne pepper, mixed thoroughly until the lemon cuts the oil; this result is obtained more quickly if your oil is thoroughly chilled and is added slowly to the lemon juice and salt; add pepper last. This is a delicate and delicious summer salad.

STRING BEAN SALAD.

String, wash and break into inch lengths one quart of tender beans, boil in salted water until tender; drain thoroughly, then mix with one cupful of French dressing, and let stand until cold. Serve on lettuce leaves, and just before sending to the table add a little more dressing.

LIMA BEAN SALAD.

If fresh beans are used boil until tender in salted water; in winter use the California dried beans and soak over night, then boil gently till tender; drain, and when cold sprinkle with salt and pepper; add one tablespoonful of chopped parsley and a few drops of onion juice; pour over a French dressing, or, if you prefer, a mayonaise; arrange on crisp lettuce leaves, garnish with hard boiled eggs.

NUT AND CELERY SALAD.

To three cupfuls of finely cut celery, add one cupful of chopped English walnuts; dress liberally with mayonaise dressing, thinned with cream. Garnish with celery leaves and slices of lemon.

PLAIN CELERY SALAD.

Wash and finely cut the celery, and cover with mayonaise creamed dressing. Serve with slices of lemon.

POTATO AND CELERY SALAD.

Cut in dice one pint of cold, boiled, potatoes, add two cupfuls of finely cut celery. Pour over one half cupful of French dressing; let stand twenty minutes. Then cover with mayonaise and garnish with celery leaves and sliced lemon.

POTATO SALAD NO. 1.

Cut cold boiled potatoes into small dice, add one tablespoonful of onion juice, or tablespoonful of chopped onion (if onion flavor is liked). Sprinkle with celery seed and dress with oil, salt, cayenne, and lemon juice, the same as Italian salad.

POTATO SALAD NO. 2.

Arrange a parsley border and lay on slices of boiled potato, add a few drops of onion juice, or bits of finely chopped onion, or celery; then add finely chopped whites of hard boiled eggs; ornament the top with chopped parsley and yolks of boiled eggs, and dress liberally with French dressing. Chill before serving.

POTATO SALAD NO. 3.

Slice five or six cold boiled potatoes, one cucumber, a dozen olives, and three small onions, into a bowl; add half a teacupful of capers, a few chopped meats of English walnuts, and cover with mayonaise dressing.

BEET SALAD.

Boil small sized beets till tender in salted water; remove the skin, scoop out the center--leaving the sides one quarter of an inch thick; pour over them a French dressing to which has been added a few drops of onion juice; stand aside for an hour. Chop up four stalks of crisp celery and one cucumber; add one tablespoonful of chopped parsley, one half teaspoonful of onion juice and the chopped pieces of the beet taken from the centers; mix all together, drain the beets, and fill with the mixture; arrange on water cress, pour over it a French dressing.

CABBAGE SALAD.

Select a solid, white, head of cabbage, cut in half; then slice as finely as possible, with sharp knife or cabbage cutter the quantity desired; let stand in cold salted water for half an hour, drain thoroughly, and dress freely with cream dressing, to which has been added a dozen sliced olives, and a teaspoonful of chopped parsley.

SALAD OF GRAPE FRUIT AND WALNUTS.

Remove the pulp carefully from the grape fruit and add walnut meats in proportion of one half to the quantity of pulp; make a dressing of three tablespoonfuls of oil, with salt to taste, a dash of cayenne pepper, and one tablespoonful of lemon juice; pour this over the grape fruit and walnuts, and serve very cold.

A SWEET SALAD.

Slice bananas, and place in pudding, or salad dish, alternate layers of banana and strawberries, covering each layer liberally with sugar. Cover with whipped cream. Instead of strawberries, oranges may be used.

ORANGE SALAD.

Beat the yolks of four eggs until very thick and light colored, then beat into them, gradually, one cupful of sifted, powdered sugar and half a level teaspoonful of salt; beat until the sugar is dissolved. Next add the juice of two lemons and beat again. Peel and slice thin, six bananas. Peel four oranges, cutting close to the pulp, pick out the seeds, and slice oranges across in thin slices. Put into a deep glass dish a layer of bananas, then of the dressing, then of the orange, then again a layer of each in the same order with banana on the top, and pour the remainder of the dressing over it. Set on ice and serve very cold.

SALMAGUNDI.

Cut into neat strips three cold boiled potatoes, one carrot, one large beet, one half of a small cauliflower--all boiled and cold. Pile in attractive order on a flat dish; chop a cucumber pickle fine and strew over the pile, cover with raw tomatoes, pared and sliced; surround with crisp lettuce leaves as an outer bordering and pour mayonaise dressing over all. Pass a boat of dressing with the salad, also toasted crackers and cheese.

LETTUCE AND GRAPE FRUIT SALAD.

Tear a head of washed lettuce into pieces. Pare and divide into carpels one grape fruit. With a pen-knife slit the white skin that envelops each carpel; take hold of the two ends, bend it back, and the fruit will fall out in little pieces, remove the seeds. Pour fruit and juice over the lettuce, and serve with a French dressing.

VEGETABLES.

CREAMED VEGETABLES.

Take equal quantities of carrots, turnips, asparagus, peas and cauliflowers. With a vegetable scoop cut the carrots and turnips into pieces a quarter of an inch square, or turn them into the shapes of olives, filberts, &c. Divide the cauliflowers and asparagus into small, neat pieces. Cook the vegetables separately in plenty of water; when tender drain and dry them; cover with white sauce and serve.

ESCALOPED ONIONS, CAULIFLOWER, OR ASPARAGUS.

Boil until tender, then put in baking dish and pour over sauce made of one tablespoonful of butter rubbed into one and one half tablespoonfuls of flour, pour over it one pint of hot milk, and cook until it is like a custard. Sprinkle thick with bread crumbs and bake one half hour. Cut the vegetables into small pieces before pouring over the sauce.

ASPARAGUS.

BAKED ASPARAGUS.

Place the asparagus with the root ends together in a baking dish; sprinkle in salt and black pepper; mix two tablespoonfuls of flour smoothly with soft butter to make a thin paste; spread it over the asparagus; cover the dish with a plate; lay a weight on it; cook it until the asparagus is very tender. It may be served in the dish in which it is baked.

ASPARAGUS ON TOAST.

Cut away the hard ends; wash, then tie lightly together in a large bunch with the heads all one way; set in deep kettle with the heads up, fill with salted water to within two inches of the top of the asparagus; cover and let boil until the stems are tender; the steam will have cooked the tops. Have ready bread toasted a delicate brown in the oven. Cut toast in strips about two inches wide, lay it on hot shallow dish or platter, butter liberally, drain the asparagus and pile it on the toast; sprinkle liberally with butter, pepper, and salt, and serve with cut lemon.

ASPARAGUS WITH WHITE SAUCE.

Make a good crust and line a baking dish, fill with cooked asparagus, dress with the white sauce; cover with top crust; and bake in hot oven.

ASPARAGUS PIE.

Make a good crust and line a baking dish filled with cooked asparagus, dressed with the white sauce; cover with top crust; and bake in hot oven.

ASPARAGUS PUDDING.

Beat together four eggs, a tablespoonful of butter, pepper and salt. Add three tablespoonfuls of flour mixed with one third teaspoonful of baking powder, then a scant cupful of milk, and finally the boiled, chopped tender tops of two bunches of asparagus. Put into a well greased mould with a top, cook in a pot of boiling water two hours; turn out and pour over it a cupful of drawn butter.

BEANS.

CREAMED STRING BEANS.

Cut the ends and string them. Put them in a covered saucepan with water, and cook till tender, drain, and remove any strings that may have adhered, then place again in the pan, add one cupful of cold milk, and salt to taste; thicken with flour mixed smoothly with

soft butter to the consistency of thick cream; let them cook until the sauce is thoroughly done, add a dash of pepper, and serve in hot covered dish.

WAX BEANS.

The yellow wax bean is very nice when young, prepare as you do any string bean, stew until tender, letting liquor boil away and seasoning with salt, pepper, and butter.

BOSTON BAKED BEANS.

Small navy beans are the best. Carefully pick over and wash one pint, soak over night in enough water to cover; in the morning place in a kettle with fresh water and boil for fifteen minutes; skim out of this water, and put into an earthen crock, add one large spoonful of molasses; one teaspoonful of mustard, salt to taste, and a large heaping tablespoonful of butter with water enough to cover; place a cover on the crock and set in the oven, cook them all day. They need to be watched at intervals of half an hour to see that the water is visible at the top of the beans; the last hour, if the oven is moderate, no more water should be added.

DRIED LIMA BEANS.

One cupful is sufficient for a family of five. Wash and put to soak over night. Steam in double boiler, with just water enough to float, until thoroughly tender. Salt to taste and add one tablespoonful of butter and a dash of pepper.

Dried beans can be freshened in an hour by soaking in hot water, and renewing the water as soon as it cools.

FRESH LIMA BEANS.

Boil until tender in just water enough to float, when nearly done, uncover and let water simmer away, add one cupful of sweet cream, and salt to taste just before serving. If you do not have cream, use milk, thickened with one teaspoonful of flour mixed with one tablespoonful of soft butter.

SUCCOTASH.

Take one cupful of cold cooked lima beans; add one half can of sweet corn, or equal quantity cut from cob; season to taste and add one teaspoonful of butter and one cupful of milk; cook until the corn is tender. Serve in hot, covered dish.

CORN.

ROASTED CORN.

Steam the ears until tender, then strip them, turn each ear in a flat plate in which there is a sufficiency of melted butter; then place them on a gridiron over a clean coal fire, and turn them until they are well toasted.

CUT CORN.

Steam the ears until tender, then strip them and cut the corn from the cob; add butter and seasoning to taste; place in hot covered dish; set in steamer until thoroughly heated through and serve very hot.

GREEN CORN--STEAMED.

Select nice full ears; and place in steamer with the husks on. Steam an hour or more until tender then strip the ears; cutting off both ends; heap the corn on a hot shallow dish and set in the oven a minute or two to dry.

CORN FRITTERS.

In the summer when fresh corn can be had, grate the corn from the cob and mix in proportion of one cupful of grated corn to three well beaten eggs; salt to taste and fry in hot butter by spoonfuls; serve hot. They are much more delicate and delicious than where flour and milk are used. The corn supplies both the milk and flour in its own substance. Grated, or very tender, canned corn can be used in the same way in the winter season.

BAKED CORN.

Chop as fine as possible the contents of one can of corn; add a heaping tablespoonful of butter; season to taste; add one pint of milk; put in baking dish; place in oven and bake until a nice brown.

CORN PUDDING.

Cut enough uncooked corn from the cob to fill a pint measure; place in covered sauce pan with a pint of cold milk; let cook until tender; then add two tablespoonfuls of flour smoothly mixed with cold milk. Stir until the mixture thickens; add two tablespoonfuls of butter; set it off to cool.

Beat the yolks of four eggs in a large bowl; beat whites separately to a stiff froth; then mix well with the yolks, add to the warm corn and milk mixture, put into a hot buttered baking dish and brown in quick oven.

CORN ON TOAST.

Take pieces of bread four inches square and fry a delicate brown in butter; then heap on the bread a large tablespoonful of stewed or canned corn and heat through thoroughly; serve very hot.

CORN PATÊS.

Chop finely half a can of corn; stir in bread crumbs until stiff; season with salt and pepper; fill patê shells two thirds full and lay piece of butter size of hickory nut on top of each filling; then pour over each one a tablespoonful of cream; place in oven and bake till delicate brown; serve hot. Very much like oysters.

If creamy dressing is preferred, omit the bread crumbs, and thicken the cream with a little flour and butter before pouring over the corn, use a little more cream to each shell.

CABBAGE.

TO BOIL CABBAGE.

Wash in cold water, and pick over very carefully. Put whole in a covered boiler, with the stem end down, sprinkle well with salt, pour over it a cupful of cold water, boil until it is very tender, then uncover it for the water to boil away; set it on the back of range to dry, take off the coarse outer leaves, serve it in a hot, deep, dish. Cut the cabbage into halves or quarters and lay butter on each piece.

CABBAGE IN WHITE SAUCE.

Cut a head of white cabbage in pieces two or three inches large, put them into a covered saucepan with salt, one cupful of cold water, and flour mixed to a smooth thin paste with soft butter; boil until the cabbage is very tender.

CABBAGE IN MILK.

Chop coarsely one-fourth large or one-half small head of cabbage; put over in saucepan with enough salted water to float; let cook until nearly done, then drain; add one quart of rich milk and cook until tender; add salt, pepper, and butter to taste.

HOT SLAW.

Chop one half large, or one small head of cabbage; put over in saucepan with salted water; cook till tender, but not soft; drain, add one-half cupful of vinegar, salt and pepper to taste, with one tablespoonful of butter.

BAKED CABBAGE.

Boil a firm, white, head of cabbage until tender, drain, and set aside until cold. Then chop fine; add two well beaten eggs; one ounce of butter; salt, and pepper, with three tablespoonfuls of cream; bake in moderate oven.

EGG PLANT.

ESCALOPED EGG PLANT.

Steam a whole egg plant until it is soft throughout; cut it in half, lengthwise; put each half into a vegetable dish; cut it in squares; sprinkle them with salt and moisten with Worcestershire Sauce; spread butter over them; dredge with powdered crackers; strew with pieces of butter and brown in a quick oven.

BAKED EGG PLANT.

Peel and cut in pieces enough egg plant to fill a quart bowl; steam until it can be mashed smooth; stir in two tablespoonfuls of butter, one tablespoonful of salt, and one half teaspoonful of black pepper; put it into a baking dish; smooth it over, dredge it with powdered cracker; strew it with pieces of butter; and brown it in a quick oven.

FRIED EGG PLANT.

Cut it crosswise into thin slices; fry them immediately in boiling cocoanut butter or vegetable oil; sprinkle both sides with salt and black pepper; cover the frying pan with a tin cover; set it on the back of range to steam until the egg plant is very tender; serve on a hot shallow dish.

EGG PLANT IN EGG AND CRACKER.

Cut it in thin slices across; fry it immediately in hot cocoanut butter or vegetable oil; lay the slices on a cold dish; sprinkle both sides with salt and black pepper; pour beaten egg over to moisten both sides; turn each slice in powdered cracker; fry them a second time in the boiling fat; lay them on a hot dish; serve them brown and crisp.

EGG PLANT BALLS.

Prepare as for baked egg plant; roll a tablespoonful into round balls in the palms of the hands, flatten them, pour beaten egg over them to moisten both sides, turn each in a plate of powdered crackers, fry them brown in boiling fat, and serve them on a hot shallow dish.

PEAS.

GREEN PEAS.

Do not wash peas, as it spoils their flavor and makes them less nutritious. Peas should not be shelled until immediately before using.

TO BOIL PEAS.

Put them into a covered saucepan, with cold water enough to float them; boil them until the peas are tender; then uncover them for the water to boil away; set them at the back of range to dry; serve them in a hot, covered, vegetable dish, with a tablespoonful of butter laid on them; or, if liked, one cupful of cream may be added just before removing from saucepan.

PEAS IN WHITE SAUCE.

Put the peas into a saucepan, with one cupful of cold water, and one teaspoonful of flour, mixed smoothly with soft butter to make a thin paste. Cover the saucepan, and boil the peas until they are very tender; add one-half cupful of cream and serve in a hot, covered dish.

PATÊS WITH PEAS.

Make little shells of puff paste and dress with peas stewed tender, to which has been added cream, thickened slightly with flour and butter.

PASTRY WITH PEAS.

Make little shells of pie crust and fill with young peas cooked tender and seasoned with pepper, salt, and butter; the peas should be carefully drained before filling the shells.

POTATOES.

BOILED POTATOES.

Boiled potatoes are more nutritious when boiled in the skin. They should be placed in a kettle with a sufficient amount of cold water to cover them, salted to taste, cooked in an uncovered kettle, and the water permitted to boil away; then let kettle remain on the back of range where they will keep hot, until the potatoes are dry and mealy. Peel before serving.

NEW POTATOES.

Small new potatoes with white skins need not be peeled, but should be buttered liberally and served in a hot dish.

MASHED POTATOES.

Boil until tender and place in colander, have ready a large bowl with tablespoonful of butter and half a cupful of cream; mash through the colander into a bowl, then whip potatoes and seasoning thoroughly with a fork, as a spoon destroys the delicacy; place in dish and set uncovered over steam to heat thoroughly. Serve quickly.

POTATO CROQUETTES.

To one pint of hot mashed potatoes add one tablespoonful of butter, one half saltspoonful of pepper, one half teaspoonful of salt, one dash of cayenne, one half teaspoonful celery salt, and a few drops of onion juice. Beat until very light. When slightly cooled, mix in yolk of one egg; add one teaspoonful of chopped parsley. Shape into croquettes, roll in fine bread crumbs, then in a mixture of egg and milk, roll again in bread crumbs, let stand about fifteen minutes in a cold place, then fry by plunging in very hot fat for a moment. Do not fry more than three at a time, in order not to chill the fat. Drain carefully.

POTATO PATÊS.

Take a tablespoonful of warm mashed potato in the palm of your hand, shaping it like a ball; then with a teaspoon take out a good part of the center. Fill this potato patê shell with minced onion and celery cooked tender in butter, and add a grating of cheese; season to taste, then cover it over with potato; dip into melted butter and egg; place in a shallow baking pan and place in a hot oven, let come to a nice brown; serve on platter garnished with parsley.

SARATOGA CHIPS.

Select medium sized potatoes, pare, wash, and slice them very thin; dry with a napkin. Have kettle of cocoa butter, or oil, heated to right temperature (see “Important Notes”) and sprinkle potatoes in kettle; do not crowd; when a delicate brown, skim out, and place in sieve in a warm place to drain; sprinkle lightly with salt.

PRINCESS POTATOES.

Boil and mash the desired quantity; while the potatoes are still warm spread them half an inch thick on a plate and set away to cool. When ready to use them, cut the potato into strips an inch wide and two inches long; dip the strips into melted butter, and then into well beaten egg, finally placing them in a baking pan and browning them in a hot oven.

WACHTMEISTER POTATOES.

Select potatoes of medium size and perfect shape; scour the skins, and steam until tender, then place in oven until skin is slightly toughened; remove from oven and open at one end, carefully removing contents, do not break the skins. Have ready a bowl of whipped cream; mash the potatoes and mix freely with whipped cream. Stuff back in potato skins and set in shallow dish, open ends up; place back in oven and let them get thoroughly hot, then serve. One who has been a strict vegetarian for years finds salt a poison; and it is omitted intentionally in the “Wachtmeister” receipt. It can of course be added to potato in mixing for those who desire it.

POTATOES IN WHITE SAUCE.

Peel and quarter potatoes, put them into saucepan (with salt, if desired) add flour and butter, mixed to a smooth paste, in the proportion of one tablespoonful of flour to two of soft butter, a teaspoonful of chopped parsley and just water enough to float potatoes; cover the saucepan and cook until potatoes are very tender.

LYONAISE POTATOES.

To one tablespoonful of finely chopped onion, add seasoning to taste; place in frying pan with two tablespoonfuls of butter and let fry a light brown, being careful not to burn. Have ready one quart of cold boiled potato cut in small dice, add and turn delicately with fork until potatoes have absorbed the butter; just before removing from fire add one tablespoonful of chopped parsley. Serve very hot.

ESCALOPED POTATOES.

Pare, wash and slice enough potatoes to nearly fill a baking dish; season to taste, fill the dish with cold milk and add one large tablespoonful of butter distributed over the top, bake in moderate oven, keeping dish covered until potatoes are nearly done. Then remove cover and brown.

FRENCH FRIED POTATOES.

Peel and cut in strips medium or small potatoes, wash, then dry with a clean towel. Have ready a kettle of cocoa butter thoroughly hot, drop in potatoes and cook until a delicate brown; if salt is used sprinkle slightly when taken from the fat, let drain in wire dish in the oven one minute, then serve in hot dish.

FRIED POTATOES.

A nice way to fry potatoes is to dip them in egg and then in bread crumbs; then fry until brown.

POTATO SCONES.

Boil potatoes in salted water; three good-sized potatoes making a sufficient supply for moderate family; drain and mash; mix with just enough flour to enable you to roll out the mixture, cut with biscuit cutter and bake on an ungreased griddle, turning frequently. The scones should have the thickness and consistency of wheat pancakes.

POTATO PEARS.

Cook five potatoes and rub through a strainer. While hot add two tablespoonfuls of butter, one half teaspoonful of salt, one fourth teaspoonful of celery salt, one fourth teaspoonful of pepper, a few grains of cayenne, and one teaspoonful of chopped parsley. Beat thoroughly and add yolk of one egg. Shape in the form of pears. Beat one egg, slightly diluting with two tablespoonfuls of milk. Roll the pears in the egg, then in crumbs, and fry in deep fat; dry on brown paper. Insert a clove at the blossom and stem of each pear. Garnish with parsley.

POTATO PANCAKES.

Grate six large potatoes; drain, and add pint of cream or milk, two well beaten eggs, one tablespoonful of flour, and beat well. Melt one teaspoonful of butter in frying pan, pour in a thin layer of batter; as it cooks loosen it from the pan, when a delicate brown, turn, and brown. Serve hot.

SWEET POTATOES.

BAKED SWEET POTATOES.

Wash carefully, cutting out any bruised spots; place in steamer. When they are tender put them in a quick oven to roast to a delicate crust.

ESCALOPED SWEET POTATOES.

Pare medium sized potatoes; cut into halves or into three slices, according to size; place a layer in a baking pan, add bits of butter, pepper, and a generous sprinkling of sugar; then add another layer of potatoes and seasoning. When all have been used, add enough boiling water to show through them, but not quite enough to cover them. Cover the pan and bake one hour in a moderate oven; then remove cover and bake one half hour longer until the potatoes are nicely browned on top. Serve in the dish in which they are baked.

SWEET POTATO CURRY.

Pare potatoes and cut into dice, about an inch in size; sprinkle with curry powder and brown in two tablespoonfuls of butter. When they are half cooked salt, pepper and cover with soup stock; boil until tender.

SWEET POTATO CROQUETTES.

Boil, peel, and mash six large sweet potatoes; season with salt, a tablespoonful of butter, one of sugar and a little pepper. When cold, mold into croquettes, dip into beaten egg, then into finely rolled bread crumbs, and fry brown in hot fat.

GLACED SWEET POTATOES.

Cut cold boiled, or steamed potatoes, into slices about an inch thick and season to taste. For one pint of potatoes, melt one fourth cupful of butter and add one tablespoonful of sugar. Dip the slices into this liquid and lay them on a large pan. Cook for twelve minutes in a very hot oven, or until they become a rich glossy brown. Serve hot.

FRIED SWEET POTATOES.

Peel and slice sweet potatoes about one fourth inch thick; fry in deep fat for about ten minutes, drain on a brown paper in warm oven for a few minutes, sprinkle with salt; serve hot.

BROWNED SWEET POTATO.

After potatoes are steamed until tender, peel and cut them in lengthwise strips; brown in hot cocoanut butter or vegetable oil.

WARMED UP SWEET POTATOES.

Any left over cold steamed potatoes can be made into a relish by peeling, slicing and frying a delicate brown in butter.

ONIONS.

Steam old onions; stew young onions.

TO STEAM ONIONS.

Put them whole into a baking dish, covered with a plate; set it in a hot oven to steam for three or more hours; take off the coarse outer skin and serve the onions in a hot, covered, vegetable dish, with butter, salt, and black pepper.

STEWED ONIONS.

Peel young onions and put them into a covered saucepan; add salt, one cupful of cold water, flour mixed smoothly with soft butter to make a thin paste, and one tablespoonful of chopped parsley; stew them until they are thoroughly tender; serve them in a hot covered dish.

YOUNG ONIONS IN WHITE SAUCE.

Select the young onions with green tops, cutting off the coarse part of the top; boil until tender; drain; place in vegetable dish and sprinkle with pepper and salt; add teaspoonful of butter; have ready one pint of milk, scalded and thickened with heaping teaspoonful of flour blended with melted butter, boiled sufficiently to thoroughly cook flour. Pour over the onions and serve.

BAKED ONIONS.

Bermuda, or large Spanish, onions are the best for baking, although the ordinary white onion will do; set them without peeling in a large pan of salted water, to which add one cupful of milk; boil until tender; drain and remove skins, put in baking pan; sprinkle with salt and pepper; add a very little of the water they were boiled in, and set in oven to brown. Pour melted butter over them and serve.

FRIED ONIONS.

Peel large onions; slice them very thin in rounds; sprinkle them with salt and red pepper; brown them in boiling cocoa butter, or vegetable oil; cover the frying pan with a tin cover; set it on the range to steam until the onions are very tender; serve them heaped on a hot, shallow dish; garnish them thickly with sprigs of fresh parsley to neutralize the odor after they are eaten.

ONIONS IN MILK.

Peel small white onions; nearly fill a quart bottle; put in two tablespoonfuls of soft butter mixed to a paste with a tablespoonful of flour, one teaspoonful of salt, and one half teaspoonful of white pepper; pour in a pint of cold milk; cork the bottle; set it in a saucepan of cold water over the fire to boil an hour or more; serve it turned into a hot covered dish.

Wash the leaves in cold water; shake out each leaf, and heap them on a colander to drain.

SPINACH.

TO BOIL SPINACH.

Put the leaves into a kettle to boil twenty minutes; then uncover the saucepan so as to boil the juice nearly away; turn the spinach into a colander; drain them into a hot vegetable dish, in which is butter, salt, and black pepper; turn it into the butter and salt; serve it with poached eggs on the top.

CHOPPED SPINACH WITH EGGS.

After spinach is boiled and dried, chop it in the saucepan very fine with a knife; set it over the fire again to dry; stir in butter, salt, and black pepper; break in two or more eggs; stir them with the spinach and let them cook until it looks quite dry; serve it in a hot vegetable dish.

SPINACH SOUFFLE.

Boil and dry spinach; chop it very fine in the saucepan and let it dry; stir in two tablespoonfuls of butter, one teaspoonful of salt, and one half teaspoonful of black pepper; let the butter be absorbed. Beat the yolks of two eggs in a large bowl, beat the whites to a stiff froth, mix them well into the yolks, stir in the hot seasoned spinach with a fork, and bake it in a hot buttered dish in a quick oven until the top is well browned.

TOMATOES.

TOMATO ON TOAST.

Use stale bread, cut in reasonably thick slices; dip in sweet milk, then in beaten egg, seasoned with salt and pepper; fry in butter till a nice brown. Have ready a quart of tomatoes that have stewed gently until reduced one fourth; season to taste; add one tablespoonful of butter and pour over fried toast. Just before serving place a poached egg on each slice.

STUFFED BAKED TOMATOES.

Select good-sized, smooth, solid fruit; wash, do not pare; cut out the hard center and remove seed pulp with finger. Fill in with mixture made of two cupfuls of bread crumbs, wet with one tablespoonful of melted butter; add two tablespoonfuls of chopped onion, one cupful of chopped celery, season to taste; heap the filling in tomatoes and put a piece of butter on top; place in earthen pie dish to bake. They should be in the oven until well browned on top; serve on squares of bread that have been fried a nice brown, in butter.

FRIED TOMATOES.

Wash and slice the tomatoes, without paring; sprinkle with seasoning, dip in flour, cook in frying pan with butter, a liberal supply of grease is required. Cover for a few minutes, so the tomatoes may steam through, and not brown too quickly, as they need to be well cooked; turn and brown on both sides. Serve on toast.

FRICASSEED TOMATOES.

Select large smooth tomatoes; cut them in half, do not peel. Take a broad agate, or enameled pan and melt in it two ounces of butter; cover the pan with the halved tomatoes that have been sprinkled with salt, and pepper, and dipped in meal; whole wheat flour is best. Put cover on pan and let cook until tomatoes are cooked through, but not broken. The fire should be moderate, and it is well to lift the tomatoes occasionally so they will not burn or stick to pan. When cooked, pour in one half cupful sweet cream, let come to a scald, and serve.

ESCALOPED TOMATOES.

Fill baking dish with alternate layers of bread crumbs and cold stewed tomatoes, well seasoned, finishing with bread crumbs on top, and break in bits over the top one heaping tablespoonful of butter, and bake until brown.

TOMATO AND RICE FRITTERS.

Add one teacupful of cold stewed tomatoes to two cupfuls of cold boiled rice; season to taste; bind with one egg well whipped; mould into smooth little shapes, and fry in butter.

DEVILLED TOMATOES.

Take two or three large firm tomatoes, not over ripe, cut them in slices half an inch thick and lay on a sieve. Make a dressing of one tablespoonful of butter and one of vinegar rubbed smooth with the yolk of one hard boiled egg; add a very little sugar, salt, mustard and cayenne pepper; beat until smooth and heat to a boil. Take from the fire and pour upon a well beaten egg whipping to a smooth cream. Put the vessel containing this dressing in hot water while the tomatoes are being broiled over a clear fire. Put the tomatoes on a hot dish and pour the dressing over them.

BREAD STUFFS.

HOME MADE YEAST.

Wash, pare, and soak one large potato. Steep one tablespoonful of hops (loose) in one pint of boiling water; mix one heaping tablespoonful of flour, one teaspoonful of sugar, one teaspoonful of salt, one teaspoonful of ginger; grate the potato into the flour mixture; let the hot water boil briskly for one minute, strain it over the flour and potato mixture, and mix thoroughly; if it does not thicken like starch, place it over the fire for a few minutes, stirring briskly. If too thick, add boiling water till thin as cream. When lukewarm or at 70 degrees, add one half cake of yeast. Raise in a warm place till frothy, beat it down every half hour. Bottle and keep in a cool place.

THREE HOUR BREAD.

Pour one cupful of boiling water over two tablespoonfuls of flour and beat well; when this becomes lukewarm add two teaspoonfuls of sugar and one yeast cake that has been dissolved in one half cupful of lukewarm water. Beat thoroughly, add flour enough to make a thick batter, beat until light and set in a warm place, about 90 degrees F. Keep covered and let rise until light and frothy, with this proportion of yeast it should rise in thirty minutes. When light add one cupful of scalded milk, cooled to lukewarm, and flour enough to make a stiff dough; stir in the flour with a spoon, beating it thoroughly; when the dough begins to stiffen, cut in the flour with a bread knife; add flour until the dough slips easily from the board, and does not stick to the hands. Then knead the dough on a slightly floured board until smooth, elastic, and full of air bubbles. Knead it firmly, but lightly, using only the wrist movements, put back in bowl, cover, and let rise in warm place until it doubles in bulk; shape into loaves, or biscuit; brush lightly with melted butter, and place in warm buttered pan. Let rise, closely covered, until loaves have doubled in bulk. Bake in an oven hot enough to brown one teaspoonful of flour placed on a piece of paper, in five minutes. If biscuits are to be baked, the oven should be hot enough to brown flour in two minutes. Let the bread bake from forty-five minutes to one hour. The first quarter of the time the bread should rise, but not form a crust; the second quarter the crust should form; the third the crust should become golden brown; the fourth

should complete the baking. Place the loaf to cool uncovered, and in such a position that the air can circulate freely around it, bottom and all.

WHOLE WHEAT BREAD.

Make a sponge of one half cupful lukewarm water, one half yeast cake dissolved in one fourth cupful lukewarm water, and one cupful of white flour; cover; and set in warm place,--about 90 degrees F.--until light and foamy; add one half cupful scalded milk, cooled to lukewarm, one half teaspoonful of salt and whole wheat flour to make a stiff dough; knead thoroughly, put into warm place, let rise until it doubles in bulk; mould into a loaf, put into a warm buttered pan, and keep closely covered in warm place until it rises sufficiently to double in size; put into a hot oven; at the end of fifteen minutes lower the temperature of oven and bake at least forty-five minutes longer. This makes one loaf.

ENGLISH UNFERMENTED GRIDDLE BREAD.

This bread is usually made from whole wheat flour. It is cooked on a griddle, hence its name “Griddle Bread.” The griddle should be made thoroughly hot before placing the dough on it, and sprinkled with a little fine white flour. Measure the meal, and for every two level measures of meal allow one measure of boiling water; have the meal in a mixing bowl, and use a wooden spoon for stirring. Make a hole in the center of the meal and pour the boiling water into it, stirring all the time till it forms a mass or lump. No kneading is required. Sprinkle the paste-board with fine white flour and turn the mass onto it. Roll out into cakes, making the cake about half an inch thick. The edge should not be ragged, but dredged with fine flour and pressed with the knuckles to an even thickness. Dredge fine flour on each piece, rub it well in with the fingers, then turn it on the other side with the knife and do the same, so that the surface has a fine smooth appearance. As each piece is prepared, place it on the hot griddle plate. Two or three minutes is sufficient time to prepare the bread from the moment the water boils. The time for the cooking necessarily varies according to the heat of the fire, which should be kept at an even temperature; twenty to thirty minutes will be found the average.

TEA ROLLS.

Make a sponge of one cupful of lukewarm water, one cake of yeast, one fourth cupful sugar, and flour enough to make a soft dough. When sufficiently raised add a little over a cupful of softened butter, and three fourths of a cupful of luke warm milk and enough flour to keep it a sponge. Beat well and let rise; then add beaten white of one egg and enough flour to knead. Knead thoroughly and let it rise again; work down; place in a buttered bowl; let it rise again, turn onto a board, roll, and cut. Shape to suit fancy, in finger rolls, bread sticks, or cleft rolls; place in pans and let rise; bake in hot oven. For Cinnamon Rolls, make as above only roll out one fourth inch in thickness and spread with softened butter, sugar, cinnamon, and currants. All bread stuffs brown better if brushed over with melted butter.

WHOLE WHEAT MUFFINS.

Take one and one half cupfuls of whole wheat flour, one cupful of common flour, two teaspoonfuls of baking powder, mix, and sift together; beat up one egg and add one cupful of milk; add one tablespoonful of melted butter and stir into the dry mixture; bake in gem pans in a hot oven for about twenty minutes.

CORN MUFFINS.

Mix thoroughly one cupful of white flour, one half cupful of fine yellow corn meal, one eighth cupful of sugar, two tablespoonfuls of baking powder; then beat one egg and stir in one cupful of sweet milk; stir into dry mixture; then add one tablespoonful of melted butter; beat well, and bake in muffin tins.

GRAHAM OR RYE GEMS.

To one and one half cupfuls of graham, or rye flour, measured after sifting, add one eighth cupful of sugar, two teaspoonfuls of baking powder, one half cupful of white flour and mix thoroughly; then add one cupful of sweet milk and two tablespoonfuls of melted butter, and stir quickly. Put in hot gem pans, bake for twenty-five minutes in hot oven.

BAKING POWDER BISCUITS.

To one pint of sifted flour add two teaspoonfuls of baking powder; sift together twice; then rub in one tablespoonful of shortening until fine, like meal. Mix in gradually enough milk to make a soft dough, cutting it in with bread knife; when stiff enough to be handled it should look spongy in the cuts, and seem full of air; turn it out on a well floured board, toss with knife until well floured, pat with rolling pin, and when dough is about half an inch thick, cut it into rounds and bake at once in hot oven.

PUFFS.

Sift one teaspoonful of baking powder into two cupfuls of flour; with one half teaspoonful of salt; add two cupfuls of milk and two eggs, beat the yolks and the whites of the eggs separately. Bake in gem pans in quick oven.

POP-OVERS.

With one cupful of flour, mix one saltspoonful of salt; add slowly one cupful of milk; when a smooth paste is formed add one cupful more of milk and one egg beaten thoroughly; beat well; cook in hot buttered gem pans or earthen cups in a quick oven for half an hour, or until the puffs are brown and well popped over. The more the milk and flour are beaten the lighter the puffs will be.

WAFFLES.

Sift together one pint of flour, one teaspoonful of baking powder, one teaspoonful of salt; add one and one fourth cupfuls of milk to smooth the batter; then add the well beaten yolks of three eggs; beat well; then whip in one tablespoonful of melted butter; and add the stiffly beaten whites of the eggs, cutting and folding these in. Have waffle-iron hot and well greased; butter as soon as taken from the iron. Sugar can be added at the same time, if relished.

BOSTON BROWN BREAD.

Take one pint each of whole wheat flour and Indian meal, one cupful of molasses, three fourths cupful of sour milk, and one half teaspoonful of soda, one and one half pints of cold water, mix; put in steamer on stove over cold water, which is afterwards brought to the boiling point and kept constantly boiling until bread is done; steam for four hours, and brown in the oven. Just before putting in the steamer add one cupful of seeded raisins.

BANNOCKS.

Two teacupfuls of oatmeal, or barley meal, sifted with two teaspoonfuls of baking powder; add two beaten eggs, one tablespoonful of sugar and one pint of milk with a little salt, sifting in the meal. Mix and bake on a griddle.

GRIDDLE CAKES.

To one cupful of flour, add one saltspoonful of salt, one tablespoonful of baking powder; sift thoroughly; add milk enough to make a batter like a thick cream; then whip in one teaspoonful of melted butter. One egg may be well beaten and added, though it is not necessary.

This receipt can be varied by using graham, corn, or whole wheat flour, in proportions of two thirds graham or wheat to one third white flour. Corn should only be one third corn to two thirds white flour.

HOMINY GRIDDLE CAKES.

To one cupful of sweet milk, add one cupful of warm, fine, boiled hominy; add one half teaspoonful of salt, two eggs,--whites and yolks beaten separately,--one teaspoonful of melted butter. In mixing add well beaten whites of eggs last. Use flour enough to make thin batter. Can be cooked either as griddle cakes or waffles.

RAISED GRAHAM GRIDDLE CAKES.

One cupful of graham meal, one cupful of flour, one half yeast cake dissolved in one quarter of a cupful of lukewarm water, mix with this one pint of milk scalded and cooled, and let it rise over night. In the morning add one tablespoonful of molasses, and one saltspoonful of soda. If the batter is too thick add a little warm water.

INDIAN MEAL GRIDDLE CAKES.

One pint of Indian meal, one teaspoonful of sugar, one teaspoonful of butter, add gradually to this sufficient boiling milk to wet the meal; when cool add two well beaten eggs, and sufficient cold milk to make a thin batter.

BREAD GRIDDLE CAKES.

One pint of stale bread crumbs; pour over them one pint of hot milk; add one tablespoonful of butter; when the crumbs are soft rub through a strainer and add the beaten yolks of two eggs, one cupful of flour, and two teaspoonfuls of baking powder. If the batter is not thin enough add a little cold milk.

RICE GRIDDLE CAKES.

Take one cupful of sweet milk, one cupful of warm boiled rice, the yolks of two eggs beaten until light, one tablespoonful of melted butter, and flour enough to make a thin batter; stir in lastly the whites of the eggs beaten stiff and dry. Bake on a hot griddle.

SOUR MILK GRIDDLE CAKES.

Sift one half teaspoonful of salt and one teaspoonful of soda into one pint of flour; add one scant pint of sour milk or cream, the beaten yolks of two eggs, and lastly the whites beaten very stiff. Bake on a hot, well greased griddle.

BREAKFAST FOODS.

WHOLE WHEAT.

Sift one cupful of whole wheat meal into one pint of boiling water; add salt to taste. Cook in double boiler and steam from one to two hours, until meal is thoroughly cooked. Very nice when cold fried in delicate slices and served with maple syrup.

Graham, rye, oat meal, or corn meal can be cooked in same way, only they require longer cooking. Corn requires the most time. Corn and oat meals need a larger quantity of water.

SANDWICHES.

CHEESE AND EGG SANDWICHES.

Beat two eggs in a bowl for two minutes, add two tablespoonfuls of milk, one eighth tablespoonful of salt, a sprinkle of white pepper; melt one half tablespoonful of butter in a small frying pan, pour in the eggs, stir until they begin to thicken, then sprinkle over one tablespoonful of freshly grated bread crumbs and two tablespoonfuls of cheese, stir for a few minutes longer, remove and put one tablespoonful of this preparation between two thin slices of bread.

EGG SANDWICH.

Break two eggs in a small bowl and beat until they foam; add a sprinkle of salt. Place a small frying pan over the fire with one tablespoonful of butter; as soon as butter is melted pour in the eggs, stir until they thicken, then remove. Butter four thin slices of bread, cover two with the eggs; lay over the remaining two slices; trim them neatly and cut them slantingly in half.

NUT SANDWICHES. No. 1.

Mix equal parts of grated Swiss cheese and chopped English walnut meat. Season with salt and cayenne. Spread between thin slices of bread slightly buttered, and cut in fancy shapes.

NUT SANDWICHES. No. 2.

Shell one half pint of peanuts and roll them fine with the rolling pin. Stir the yolk of one hard boiled egg to a cream with one half tablespoonful of butter, add one teaspoonful of French mixed mustard, one quarter teaspoonful of salt, one tablespoonful of lemon juice, one half tablespoonful of unsweetened condensed milk, one half cupful of finely chopped red apple, the finely chopped white of an egg, and the nuts. Put one tablespoonful of this mixture between two thin slices of bread; trim them evenly all around, and cut them slantingly into two pieces.

PLAIN CHEESE SANDWICH.

Butter the bread; lay thin slices of cream cheese to cover, add a lettuce leaf, and cover with another piece of buttered bread.

COTTAGE CHEESE SANDWICH.

Use crisp, square crackers, wet the cottage cheese with sweet cream, season to taste, and spread on crackers.

OLIVE AND CAPER SANDWICHES.

Chop olives very fine, add one third as much of finely chopped capers; mix thoroughly with a little soft butter; season with celery salt, cayenne, a very few drops of lemon juice, and a little of the grated lemon peel. Spread on thin squares of buttered graham bread.

CHEESE AND MUSTARD SANDWICH.

Grate one fourth pound of cheese and mix one half teaspoonful of salt and mustard, with a dash of cayenne pepper; melt one tablespoonful of butter and blend with seasoning; then stir thoroughly into the cheese; if liked, a teaspoonful of lemon juice may be added. Spread on thin slices of whole wheat, or white, bread.

BOILED EGG SANDWICHES.

Chop the whites of hard boiled eggs very fine; blend the yolks with a little cream or melted butter, season to taste, and spread on buttered white bread.

TOMATO SANDWICH.

Cut thin slices of brown bread; spread with French mustard; then a layer of cream cheese; sprinkle lightly with salt; peel and slice some small, solid, ripe tomatoes. Cover the prepared bread with the slices; form into sandwiches and cut in broad strips. Serve with water cress.

TOMATO AND EGG SANDWICH.

Chop the whites of four hard boiled eggs very fine. Mash the yolks and blend with a little thick cream, some tomato pulp, salt, pepper, and a tiny pinch of sugar. Spread on thin slices of brown, buttered, bread.

CHOCOLATE SANDWICH.

Melt one ounce of grated chocolate; whip in a little hot cream; add one half teaspoonful of vanilla flavoring, a little confectioner’s sugar, and the yolk of one egg. Stir until it begins to thicken, then whip in the whites of the egg beaten to a stiff froth.

Spread on thin slices of sponge cake, or white bread and butter.

MUSHROOM SANDWICHES.

Stew a few large mushrooms in one ounce of butter; cover closely and cook slowly so that they shall not burn; mash them with pepper, salt, and a dash of nutmeg; cut thin slices of whole wheat bread, butter and spread with the mushroom paste. Cut into finger sandwiches.

PINEAPPLE SANDWICH.

Cut small sweet sponge buns in slices; spread them with grated pineapple; sift with fine sugar; press two slices together and spread soft icing on top and sides.

ITALIAN SANDWICHES.

Make a mixture of chopped olives, grated cheese and chopped English walnuts in the proportion of two fifths each of cheese and olives to one fifth of nuts; then make a dressing of five tablespoonfuls of malt vinegar (or six, if ordinary vinegar is used) bring to a scald and stir into the well beaten yolks of five eggs; set the egg mixture back on the stove and stir constantly until it becomes as

thick as cream; then remove from the stove and beat in one tablespoonful of butter, whipping until the butter is dissolved and thoroughly blended. Season to taste with salt, pepper and mustard; if liked add a dash of cayenne. Stir in the chopped olives, nuts, and cheese. Spread between crisp square crackers, or thin slices of whole wheat bread.

FRUIT SANDWICHES.

Slice whole wheat or graham bread very thin, butter, then spread with a layer of chopped raisins, or candied cherries wet with orange juice.

GRAHAM SANDWICHES.

Chop olives; add a little chopped parsley and a little finely chopped celery; mix with mayonaise dressing to which has been added a few drops of onion juice and a very little French mustard; spread thin slices of graham bread very lightly with butter; then put a layer of the mixture; cover with another slice of buttered bread and cut into strips or squares.

RUSSIAN SANDWICHES.

Spread zephyrettes (crackers) with thin slices of cream cheese; cover with chopped olives mixed with mayonaise. Place a zephyrette over each and press together.

CAKES AND ICINGS.

CAKES.

Thin cakes require a hotter oven than those baked in thick loaves. Cakes with molasses in them burn more quickly than others. Thin cakes should bake from fifteen to twenty minutes, thicker cakes from thirty to forty minutes, and very thick loaves about one hour. If only the yolks of the eggs are used the cake is richer, if only the whites it is lighter. Have all ingredients ready, then see that fire and oven are right, and mix carefully. The secret of fine grained cake is in the mixing. First always cream the butter by beating, then add sugar slowly, creaming carefully, then add the well beaten yolks of eggs. Sift the flour and baking powder together three times, at least, then add alternately in small quantities the flour and milk, and last of all the stiffly beaten whites of eggs, working them in as lightly as possible.

ONE EGG CAKE.

Cream one half cupful of butter in a warm bowl adding slowly one cupful of sugar, whip the yolk of one egg and add to butter and sugar. Have ready two cupfuls of flour into which has been sifted two teaspoonfuls of baking powder; put flour and baking powder through sifter three times. Add flour and one cupful of milk slowly and alternately to butter mixture, adding last of all the whites of egg beaten stiff and one teaspoonful of flavoring. Bake in loaf in moderate oven for thirty minutes.

ORANGE CAKE.

Cream one third cupful of butter with one and one half cupfuls of sugar; add the well beaten yolks of three eggs and one teaspoonful of flavoring, beat well; add alternately, in small quantities, two heaping cupfuls of flour, into which two rounded teaspoonfuls of baking powder has been sifted, and one cupful of milk; last of all add the whites of the three eggs, beaten to a stiff froth, folding them into the dough lightly. Bake in shallow pans for about twenty minutes, or until cake shrinks from the pan. Put together with orange icing.

IDA’S CAKE.

Beat the whites of four eggs very stiff and set in refrigerator to chill; cream the yolks; add one cupful of sugar and a teaspoonful of lemon extract; sift flour until very light, and sprinkle in one cupful slowly, stirring lightly; then fold in the whites of the eggs as delicately as possible. Bake in moderate oven.

ANGEL FOOD.

Sift one cupful of flour and one half teaspoonful of cream of tartar together, sifting at least six times; add one cupful of sugar, sift again; beat the whites of seven eggs stiff; chill; then whip in the flour and sugar; flavor with one teaspoonful of vanilla extract. Bake

in moderate oven.

WATER SPONGE CAKE.

Beat the yolk of one egg, add one half cupful of sugar and beat again, add one half teaspoonful of lemon juice and three tablespoonfuls of cold water, then two thirds of a cupful of flour into which one half even teaspoonful of baking powder has been sifted, and lastly the whites of the egg beaten stiff. Bake in shallow pan or in small tins.

TEA CAKES.

Tea cakes that are much esteemed in southern households are made from the yolks of six eggs, half a pound of butter, one pound of sugar, one pound of flour and one teaspoonful of baking powder mixed with the flour. They should be rolled thin and baked in a quick oven. Frost with a thin icing or sprinkle while hot with granulated sugar.

POOR MAN'S CAKE.

Take three good-sized apples, pare, chop them fine, put them into a saucepan with two cupfuls of molasses, and boil until the apples are soft--say for three minutes--remove, and add one cupful of sugar, one egg, and one half teaspoonful of ginger, cinnamon allspice, clove and nutmeg, one cupful of strong coffee in which one and one half teaspoonfuls of soda are dissolved; two and one half cupfuls of flour.

This cake will keep all winter. These proportions make three large cakes.

COFFEE CAKE.

One cupful of brown sugar, one cupful of molasses, one half a cupful of butter, one beaten egg, one half a cupful of strong coffee, one tablespoonful of ground cinnamon, one teaspoonful of ground cloves, four cupfuls of seeded raisins, one cupful of thinly sliced citron, four cupfuls of flour into which has been sifted one teaspoonful of soda. Bake in moderate oven.

CREAM CAKE.

Dissolve one half teaspoonful of soda and mix with one scant cupful of sour cream, beat one egg and stir in, add a scant cupful of sugar and one and one half cupfuls of flour. This can be baked as a loaf, or in gem pans, or used for layer cake.

FRIED CAKES.

Two cupfuls of sugar, four eggs, one cupful of sour cream, and one cupful of buttermilk, one teaspoonful of soda, nutmeg to taste, flour enough to make a soft dough; roll until one half inch thick, cut in rounds, cutting out small ring in center; fry in hot cocoanut butter. The fat should be deep enough to float the cakes and hot enough to cook quickly; when nicely browned, drain, then powder with confectioner's sugar.

SUGAR COOKIES.

Mix one half cupful of creamed butter with one cupful of sugar, beat to a smooth cream. Whip one egg light and add to sugar and butter; add one teaspoonful of flavoring and one fourth cupful of milk with flour enough to make sufficiently stiff to roll thin, having previously sifted through the flour one half teaspoonful of baking powder. Roll a little at a time, cut out and bake about ten minutes in hot oven.

JUMBLES.

Two eggs, six tablespoonfuls of butter, six tablespoonfuls of sugar, one teaspoonful of lemon extract, a pinch of soda sifted in flour enough to make a dough stiff enough to roll. Roll very thin, cut and bake in quick oven.

GINGER SNAPS.

To one cupful of molasses add one half a cupful of water, in which has been dissolved one teaspoonful of soda; one cupful of sugar, one teaspoonful of ginger, one teaspoonful of cinnamon, one cupful of butter with flour enough to roll. Cut and bake in quick oven.

SOFT GINGERBREAD.

Dissolve one teaspoonful of soda in four tablespoonfuls of hot water, mix with three fourths of a cupful of molasses; add four tablespoonfuls of melted butter and one and three fourths cupfuls of flour with ginger enough to flavor; bake in gem tins.

MACAROONS.

One pound of sweet almonds blanched and beaten to a paste; mix with them one and a quarter pounds of powdered sugar, the grated rind of two lemons and the whites of six eggs. Drop on buttered paper and bake a light brown in a moderate oven.

LADY FINGERS, NO. 1.

Beat two eggs until light; add one teacupful of sugar, a little salt, and flavoring to taste. Use one teacupful of flour sifted with one teaspoonful of baking powder, making the dough of a consistency that can be rolled. Cut into strips the size of the finger and bake.

LADY FINGERS, No. 2.

One half pint whites of eggs, beaten very stiff; add gradually one half pound sugar, beating well all the time, add the yolks of the eggs and mix together lightly; then stir in very lightly one half pound of flour. Transfer the mixture into fingers on sheets of paper. Dust with powdered sugar, and put on pans and bake in hot oven. Watch them very carefully, as it only takes a few minutes to bake them. When cold they may be removed from the paper by placing them on the table face down, and washing the bottom of the paper with a wet sponge. Now turn back to their proper position and they can be easily removed. Join them in pairs and keep them covered until used.

ÊCLAIRS.

Put into an enameled saucepan one quarter pound of butter, one quarter pint of water, and a few drops of lemon juice; bring all to a boil; while boiling mix in smoothly one quarter pound of flour, draw back the saucepan from the fire and add to the mixture three well beaten eggs. Bake on greased tins in hot oven about twenty minutes. When done make a slit in side of each and quickly fill with either thick custard, or stiff whipped cream that has been sweetened and flavored; then as quickly as possible pour some chocolate frosting over the top. Serve when cold.

CREAM PUFFS.

Boil with a large cupful of hot water half a teacupful of butter, stirring in one teacupful of flour during the boiling; set aside to cool and when cold stir in four eggs, one at a time without beating; drop on tins quickly and bake in a fairly hot oven. When baked fill in with a cream made by beating together three tablespoonfuls of flour, one egg, and half a teacupful or more of sugar, according to taste; stirred into half a pint of milk while boiling, and flavored to liking.

FRUIT JUMBLES.

Beat to a cream one cupful of butter; add gradually one and one half cupfuls of sugar, the yolks of three eggs beaten, one teaspoonful of ground cinnamon, one half teaspoonful of ground cloves, one half a nutmeg, grated, the juice and rind of one lemon, three tablespoonfuls of sour milk, in which has been mixed three fourths teaspoonful of soda; one cupful of seeded and chopped raisins, the beaten whites of three eggs, and about three and one half cupfuls of flour; either roll and cut out, or drop by the spoonful on a buttered sheet.

CHOCOLATE STRIPS.

Cream three tablespoonfuls of butter, add gradually one cupful of sugar, add three tablespoonfuls of melted chocolate, one teaspoonful of vanilla and one cupful of flour, beat thoroughly, spread very thin on well buttered pans, bake in a quick oven, brush with the white of egg as soon as you take from the oven, cut into strips one inch wide while hot.

MISS FARMER’S SPONGE CAKE.

Beat the yolks of four eggs until thick, add gradually one cupful of sugar, and beat for two minutes; add three tablespoonfuls of cold water, mix and sift thoroughly one and one half tablespoonfuls of corn starch, one scant cupful of flour, one level teaspoonful of

baking powder, one fourth teaspoonful of salt; add to the first mixture the whites of four eggs beaten stiff, and one teaspoonful extract of lemon. Bake in a buttered angel cake pan for forty-five minutes, or in a shallow cake-pan for thirty-five minutes in a moderate oven.

VELVET CAKE.

Cream one half cupful of butter, add gradually one and one half cupfuls of sugar, add three egg yolks well beaten and one half cupful of cold water, mix and sift thoroughly one and one half cupfuls of flour, one half cupful of corn starch, two level teaspoonfuls of baking powder; add with the beaten whites of four eggs; cover with opera caramel frosting.

ICINGS.

SOFT FROSTING.

Boil one cupful of sugar and one third cupful of water until it will string, pour slowly on the beaten white of one egg, beating constantly until cool; flavor to taste.

CREAM ICING.

Two tablespoonfuls of cream and one half teaspoonful of flavoring, add sufficient confectioners' sugar to make stiff enough to spread. Any kind of fruit juice may be used instead of cream. Orange is very nice.

ORANGE ICING.

Yolk of one egg, grated rind and juice of one orange; confectioners' sugar to make thick enough to spread.

OPERA CARAMEL FROSTING.

Cook one and one half cupfuls of brown sugar, three fourths cupful of thin cream and one half tablespoonful of butter until a ball is formed, when the mixture is tried in cold water. Beat until ready to spread.

DESSERTS.

PASTRY.

Sift one cupful of flour and one saltspoonful of baking powder together. Rub in two tablespoonfuls of shortening, mix quite stiff with ice water, using about one fourth cupful. Turn out on a floured board, pat, and roll till one fourth inch thick, then distribute one teaspoonful of butter over the surface. Sprinkle with flour and fold over and over, roll out again into a long strip, then roll like a jelly roll, and cut from end as needed, and roll out from end. The secret of good pastry is to thoroughly chill material.

For all fruit and custard pies brush bottom crust with white of egg before putting in filling. The crust will then remain dry and delicate.

A RICH PUFF PASTE.

One quart of flour and one pound of butter; sift the flour and work in the yolk of an egg well beaten; mix with ice water and roll out to the thickness of an inch or less. After the butter has been worked in cold water to extract the salt, place it on one half of the dough, folding the other half over it, set away for fifteen minutes in an ice chest, or other equally cold place, and then roll out into a long strip, which fold into three parts by turning over each end and rolling each fold; repeat this operation six or seven times. The colder the dough can be kept while being worked in this way, the better will be the results.

MINCE PIES.

To one cupful of water add one cupful of molasses, one cupful of sugar, one beaten egg, one cupful of vinegar, two and one half Boston crackers, rolled fine, one cupful of stoned raisins, butter the size of an egg, one quarter of a teaspoonful of cloves; two thirds of a teaspoonful of cinnamon; two thirds of a teaspoonful of allspice.

This will make three pies. The pies should bake slowly, taking about three quarters of an hour. A grating of nutmeg should be added to each pie before putting on upper crust. The egg, cracker, and slow baking thickens this apparently thin mixture.

FRUIT PIE.

Carefully wash two thirds of a cupful of dried currants, add equal quantity of seeded raisins; with one cupful of sugar and one cupful of water; place in saucepan and boil gently for one half hour; remove from the fire and add two tablespoonfuls of vinegar, with cinnamon, cloves, allspice, and nutmeg to taste; two chopped apples, one tablespoonful of rolled crackers, half a cupful of chopped, sweet pickled peaches, or any preserved or spiced fruit; bake with two crusts. This will make two pies.

CREAM PIE.

Make a boiled custard, with one pint of milk, yolks of two eggs well beaten, and three tablespoonfuls of sugar, place in double boiler and thicken with one tablespoonful of flour that has been blended with melted butter, add one half teaspoonful of vanilla, let cook until flour is thoroughly done (if too thick a little more milk can be added). Have ready a baked pastry, fill with the mixture; then whip the whites of the two eggs to a very stiff froth and add one half cupful sugar and a few drops of flavoring, spread over the pie; set in oven just long enough to set the frosting and touch it with delicate brown. Serve cold. A chocolate pie can be made after the same method by omitting the yolks of the eggs and beating into hot milk one-fourth cake of chocolate.

CUSTARD PIE.

Beat three eggs until light, add three tablespoonfuls of sugar and beat again. Then grate sufficient nutmeg to flavor, and add three cupfuls of scalded milk. Bake slowly in single crust; as soon as the custard puffs and a knife blade can be dipped in and comes out clean, it is done.

LEMON PIE.

Beat the yolks of three eggs until thick, add one cupful of sugar and the grated yellow rind of one large lemon (be very careful not to grate any of the white of the lemon skin or it will make pie bitter), also the juice; beat until thick and light colored, then add one tablespoonful of corn starch, dissolved in a little water. Pour into a pie shell and bake slowly until it puffs. Beat the whites of the eggs until light, then gradually add three tablespoonfuls of sugar and beat until stiff. When the pie is slightly cooled, cover with this frosting, return to oven, and let it get a very delicate brown. Serve cold.

SQUASH PIE.

To one and one half cupfuls of prepared squash, add one cupful of scalded milk, one half cupful of sugar, one saltspoonful of cinnamon, a dash of nutmeg and cloves, and one egg well beaten, pour in egged crust, and bake thirty minutes, or until it puffs up all over. Sweet potato may be used in place of squash. To prepare squash or sweet potato, steam and mash.

RIPE CURRANT PIE.

To one cupful of the fruit, washed and removed from stems, add one cupful of sugar; one cupful of cream, and one tablespoonful of flour; bake with only an under crust.

NEUFCHATEL CHEESE PIE.

One Neufchatel cheese, one teacupful of sugar, grate the rind of one lemon and use with it one half of the juice, half a teacupful each of rolled cracker crumbs, and currants, four eggs, one tablespoonful melted butter, half a teacupful of cream, or rich milk, half a nutmeg grated and one saltspoonful of salt. Crumble the cheese and cracker crumbs well together, beat the eggs with the sugar and add to cracker mixture, following with the butter and cream. If the cream is very rich the butter may be omitted. Lastly, add lemon, nutmeg and currants. The currants should previously be washed, dried and dusted with flour. Mix all well together and put into well buttered patty-pans that have been lined with puff-paste. Bake fifteen or twenty minutes in a quick oven. They will puff up, but must not be permitted to get too brown.

PINE-APPLE TART.

Line a pie plate with pastry, and fill with mixture made of one ounce of butter, and one half cupful of sugar beaten to a cream; the well beaten yolks of five eggs, a grated pineapple, one teacupful of cream and add last of all the whites of the eggs beaten stiff and folded in lightly, with a little more sugar.

ALMOND PEACH PIE.

Line a pie dish with puff or good plain paste, lay halves of canned peaches, with the stone side up all over the bottom of the crust; fill the cavity where the pit was with a spoonful of chopped almonds; sprinkle with sugar and pour over a very little of the peach juice; cover with a crust, and bake till a nice brown; serve with, or without cream.

PUDDINGS.

IRISH MOSS JELLY.

Pick over and wash carefully one half cupful of Irish Moss. Put it into one pint of boiling water, add the thin yellow rind cut from one lemon, and one cupful of sugar; simmer until the moss is dissolved, add the juice of lemon and a grating of nutmeg, and strain into a cold, wet, mould. Set away to harden; serve plain, or with cream. Orange may be used in place of lemon, though a dessert spoonful of lemon juice used with the orange improves the flavor. This Irish Moss may be substituted in place of gelatine in all delicate puddings calling for that animal product; it is to be had at any druggist's.

SAGO MILK.

Soak a cupful of sago in a quart of cold milk; put in a double boiler with one cupful of sugar; cook until the sago is dissolved; pour it into a dish, and stir in ten drops of the essence of lemon or vanilla. Serve it hot or cold.

SAGO JELLY.

Soak a cupful of sago in a quart of cold water over night; boil in double boiler for an hour; then uncover it for the water to boil away. Add two cupfuls of sugar and the strained juice of a lemon; pour it into a dish in which it may be served. Serve it cold, with smooth fresh cream, sweetened and flavored.

ORANGE FOAM (FOR TWELVE PERSONS).

To the juice of twelve oranges (the small, tart ones are best) add the juice of one lemon, the grated yellow rind of two oranges, and three cupfuls of sugar. Whip till very light the yolks of twelve eggs; then whip in the prepared juice. Whip the whites of eggs as stiff as possible (keep them well chilled while whipping) and beat in lightly, yet thoroughly, the prepared mixture. Serve in punch glasses with lady fingers. Place half of a lady finger in bottom of each glass. The amount of sugar used may vary according to the flavor of the oranges. If the foam is not stiff, then add more whites of eggs. It is difficult to give exact quantities because the flavor and juiciness of the fruit varies so. This should be prepared just before serving.

NEAPOLITAN PUDDING.

Dissolve a cupful of currant jelly in a cupful of hot water; thicken with dissolved corn starch (be careful not to use too much corn starch, only just enough to make it stiff when chilled). Have ready a chilled mold, pour in the mixture as soon as the starch is thoroughly cooked, and the white of one egg, whipped till very stiff, is added to the mixture. Then make an equal quantity of strong sweet lemonade, bringing this to a scald, thicken the same way, adding egg in same manner; pour this as second layer in mold. Then take two cupfuls of milk, bring to a scald, sweeten, and thicken as before, then add the yolks of two eggs, well beaten, whipping in one half teaspoonful of vanilla flavoring, add to previous layers in mould (the layers can be placed in order to suit fancy), set away to chill thoroughly, and serve with whipped or plain cream. Other fruit flavors can be used in same way--pineapple or apricot syrups are very nice.

FRUIT MANGE.

To one pint of boiling water, add the juice of two nice, though any sauce may be used--brought to a scald, add one tablespoonful dissolved corn starch with sugar to taste; let boil until starch is well cooked, remove from stove and add the whites of two eggs, beaten stiff; pour into wet mould, and chill. Serve with cream and sugar.

LEMON SNOW.

To one pint of boiling water, add the juice of two lemons, and two tablespoonfuls of corn starch, well mixed with one and one fourth cupfuls of sugar; strain, and cook until thick. When partly cooled, beat vigorously with a wire egg beater or spoon, add the whites of three eggs, beaten to a stiff froth, whip in thoroughly, and pour into a chilled, wet mould; when firm and cold, turn out and serve with cold boiled custard and jelly, or cream and sugar.

ORANGE SOUFFLÉ.

Make a boiled custard with the yolks of five eggs, a quart of milk, and sugar to taste. When cool pour it over four sliced oranges, from which all seeds and tough fibre have been removed, and to which has been added one cupful of sugar, and grated rind of one orange. Place this in baking dish, cover with a meringue made of the whites of four eggs; then place the dish in a shallow pan of cold water and put in oven until the meringue is a golden brown. Serve cold.

ORANGE CUSTARDS.

Beat the yolks of six eggs with one and one half cupfuls granulated sugar till light; add to this two cupfuls of orange juice, the juice of one lemon, and the grated peel of one orange; fill in small cupfuls and place in steamer, when solid set away to chill; serve on boiled rice, over which pour a pint of rich cream, sweetened and flavored with a little grated peel of orange.

CHESTNUT CREAM.

Roast the chestnuts, then grate to powdered flakes, heaping lightly in middle of pudding dish, surround with apricot jam, and serve with whipped cream.

PEACH CAKE.

Have sponge or plain cake baked in two layers; cut or slice canned peaches; cover a layer of the cake with the cut peaches; put on another layer of cake and more peaches and turn over all well sweetened and flavored whipped cream.

STEAMED CABINET PUDDING.

Use one tablespoonful of butter to grease a three pint pudding mould. Take one cupful of fruit; raisins, candied cherries, or preserved fruits, as you prefer; sprinkle one half the fruit in the buttered mould, then break in stale cake or bread crumbs, mixing with it the rest of the fruit, filling the mould lightly. Then whip up three eggs, add to them three tablespoonfuls of sugar and three cupfuls of milk, pour over the cake and fruit mixture. Let stand one hour, then steam for one and one fourth hours. Serve hot with creamy sauce.

COLD CABINET PUDDING.

Make a custard of one pint hot milk, yolks of three eggs, three tablespoonfuls of sugar; thicken with corn starch. Flavor with teaspoonful of vanilla. Decorate a mould with candied fruit; cover fruit with custard; cool, add a layer of lady fingers or stale cake, then a layer of fruit and more custard, and chill; continue until the mould is full. Serve with whipped cream and candied cherries.

PRUNE WHIP.

Wash thoroughly one half pound of prunes and soak three hours in enough water to cover; cook in same water until the consistency of marmalade. Rub through a sieve, sweeten. Whip the whites of four eggs, and add the prunes (which should be thoroughly chilled); beat until well mixed; pile lightly on a buttered platter, and bake until a delicate brown. Serve with whipped cream or soft custard.

WASHINGTON PIE, CHOCOLATE FILLING.

Make a plain cup cake, and bake in two layers. For the filling, beat the yolks of two eggs till light, and add one half cupful of sugar; stir this into one half cupful of milk; melt two ounces of chocolate and stir into the milk; put on stove, and cook till it thickens; beat till cool, flavor with vanilla and spread on the cake between layers and sprinkle confectioners' sugar on top. Plain Washington pie has simply a dressing of whipped cream, sweetened, and flavored with vanilla, between the layers.

STRAWBERRY CREAM CAKE.

Make cake the same as for any good layer cake. For the filling take one cupful of thick sweet cream, whip until stiff, add four tablespoonfuls of fine grained granulated sugar and one pint of strawberries, crushed slightly, and sweetened. When cake is perfectly cold spread between layers. This should not stand long before serving.

CHARLOTTE RUSSE PIE.

Three eggs, one and one half cupfuls of sugar, two cupfuls of flour, one teaspoonful of pure cream of tartar, one half cupful of cold water, one half teaspoonful of soda. Beat the eggs thoroughly with the sugar, add one cupful of flour with even teaspoonful of pure cream of tartar, then water, and another cupful of flour. Enough for two pies.

Filling--Pure, sweet cream, beaten until stiff; sweetened to taste; flavored with vanilla. Cut open pie, fill, and pile some cream on top. Two cupfuls of cream will fill two pies.

STEAMED FRUIT PUDDING.

Make a dough of six heaping tablespoonfuls of flour; pinch of salt, one heaping teaspoonful of baking powder, two tablespoonfuls of cream, and water enough to make a soft dough; mix as lightly as possible. Then add one pint of any preserved or stewed fruit that is desired, the fruit should be well sweetened; steam for forty minutes. Be particular to keep the steam at regular heat, not letting it die down. Serve with syrup, made of the fruit juice, or hard sauce.

CHARLOTTE RUSSE.

One quart of rich, sweet, cream; whipped to a stiff foam; sweeten, after whipping, with two tablespoonfuls of sugar, and flavor with scant teaspoonful of vanilla extract. Line a glass bowl with separated lady fingers, and heap the whipped cream lightly in the bowl. Chill, and serve within an hour.

CONNECTICUT INDIAN PUDDING.

Add to three tablespoonfuls of cornmeal, three fourths of a cupful of molasses and a little salt; mix well; put one generous quart of milk in double boiler; when scalding hot add the meal and molasses; stir till free from lumps; let cook for five minutes; then butter well a baking dish, grate the rind of two or three oranges; put a layer on the bottom of the dish; pour in the liquid and put the rest of the grated peel on top; add one tablespoonful of butter to one fourth cupful hot milk; pour over pudding; bake three hours in a moderate oven; eat with rich cream, or hard sauce.

CHINESE PUDDING.

Whip one pint of cream and set it in a pan of cracked ice; add one half cupful of chopped preserved ginger, one half cupful powdered sugar; one half cupful of cold boiled rice.

Dissolve one half cupful of Irish moss in boiling water, using as little water as possible; strain, and stir into the cream mixture; stir until it thickens. Set away to harden, and serve with ginger sauce.

BANANA PUDDING.

Make one quart of strong sweet lemonade, bring to a scalding point, add juice of one orange. Thicken with dissolved cornstarch, the same as any cornstarch pudding; being careful not to make too stiff. Have ready the whites of two eggs, beaten very stiff. When the corn starch is thoroughly cooked, set the dish off the stove and whip in the eggs. Then slice in two bananas, pour in moulds, set away to chill thoroughly, serve with cream and sugar. This is quite as delicious as any gelatine pudding.

CREAM RICE PUDDING.

Two cupfuls of milk, two tablespoonfuls of rice, two tablespoonfuls of sugar, one half saltspoonful grated nutmeg, one half cupful stoned raisins. Stir frequently. When it begins to thicken add more milk, sweetened and spiced; when rice is tender add one half cupful cream and remove from oven. Serve cold.

SWEET POTATO PUDDING.

Peel and grate the potatoes. To one quart of them add two eggs, two tablespoonfuls of butter, three fourths of a cupful of sugar and one cupful of sweet milk. Cream the butter and sugar, add the eggs, stir well, then add the other ingredients, stirring briskly. Bake one hour. Serve hot without sauce.

OAT MEAL PUDDING.

To one cupful of cold boiled oatmeal, add one cupful of sugar, three cupfuls of milk, two well beaten eggs, one tablespoonful of vanilla and one half cupful of seeded raisins; bake in moderate oven about three quarters of an hour.

SNOW BALLS.

Cook one cupful of rice until tender. Wring small pudding cloths (one third yard square) out of hot water and lay over a small bowl. Spread rice one third of an inch thick over cloth. Put an apricot in the center, filling in each half of apricot with rice. Tie tightly and steam ten minutes. Remove the cloth carefully and turn the balls out on a platter, and serve with apricot sauce. Canned apricots may be used. If fresh fruit is preferred steam the apricots tender before removing stones.

CREAM PUDDING.

Stir together one pint of cream, three ounces of sugar, the well beaten yolks of three eggs, with scant teaspoonful of vanilla flavoring. Whip the whites of the eggs very light and add last, stirring lightly. Pour into baking dish that has been well buttered and upon which has been sprinkled bread crumbs to the thickness of ordinary pie crust. Sprinkle bread crumbs over the top of pudding, set dish in shallow pan half filled with water, and bake the same as any custard.

FRENCH BREAD PUDDING.

Butter small thin squares of bread and spread with jam, or tart jelly; place them in a buttered pudding dish; have the dish about one half full; pour over a boiled custard (using the yolks only for the custard); beat the whites of two eggs, adding gradually two tablespoonfuls of powdered sugar; beat one large tablespoonful of the jam or jelly used; heap on top of the custard and brown slightly in the oven.

SAUCES FOR PUDDINGS.

APRICOT SAUCE.

Take one cupful of apricot juice, thicken with one teaspoonful of corn starch and sweeten with one half cupful of sugar; let boil until clear.

HARD SAUCE.

Beat together one half cupful of butter and one cupful of sugar until it is creamy and white; flavor with one teaspoonful of vanilla extract.

CREAMY SAUCE.

Cream one half cupful of butter, then stir in one cupful of powdered sugar, a little at a time, and beat until very light. Then add one fourth cupful of cream or milk and one scant teaspoonful of vanilla flavoring. Just before serving set the bowl in a pan of hot water, and as soon as the sauce is smooth and creamy remove from fire. It should not be heated enough to melt the sugar.

GINGER SAUCE.

Chop finely one fourth cupful of preserved ginger; add one cupful of water and a quarter cupful of sugar, and boil for five minutes. Pour it over the well beaten whites of two eggs, add two tablespoonfuls of lemon juice, and chill.

CURRANT JELLY SAUCE.

Put four tablespoonfuls currant jelly in a saucepan with one teaspoonful of butter; let it heat and melt slowly; pour over one half cupful of boiling water, moisten one teaspoonful of cornstarch with a little cold water; add to the other ingredients and cook five

minutes; add the juice of one orange, grated peel of one half orange and one and one half tablespoonfuls blanched almonds finely chopped.

EGG SAUCE.

One cupful of sugar, a tablespoonful of butter, two eggs, a little salt, and a teaspoonful of vanilla, or any flavoring preferred. Mix the butter and sugar to a cream, add the yolks of the eggs, and beat until very light. Beat the whites to a stiff froth and stir in, add flavoring and beat well together. This is especially good for apple or berry dumplings. Lemon is nice to flavor it when used for apple puddings, but should not be used for other fruits. When a plainer sauce is desired, leave out the butter.

APPLE DESSERTS.

STEAMED APPLES.

Wash, pare, and remove cores of six tart apples; place in earthen dish and put in steamer, over boiling water. Steam until soft. Serve with steamed oatmeal or boiled rice, and cream and sugar.

BAKED APPLES.

Wash, and core sour apples. Place them in earthen or granite dish and fill the center of each apple with sugar. Measure one tablespoonful of water for each apple and pour around the apples (not over, as you should not disturb the sugar in apple centers). Bake until tender, remove apples to the dish in which they will be served at table. Strain the juice, add one third cupful of sugar. Cook five minutes, and pour it over the apples, let cool, and serve with cream.

APPLE FRITTERS.

Core, pare, and cut apple into slices one fourth inch thick, sprinkle with sugar and cinnamon or nutmeg, and set them aside while making batter.

Beat the yolks of two eggs, add one tablespoonful sugar, one half cupful of sweet milk, and enough flour to make it almost a drop batter. Melt one tablespoonful of butter and add to mixture. Beat in the well whipped whites of two eggs. Dip each slice of apple into the batter, see that it is well covered and quickly drop into a kettle in which is sufficient hot cocoa butter or vegetable oil to float it; fry until the apple is soft, and the fritter a light brown on both sides. Drain, trim, and sprinkle with pulverized sugar. Serve hot.

APPLE DUMPLINGS BAKED.

Select moderate sized, tart apples; pare, core, and steam until tender, not soft; have ready a plain pie crust rolled thin in pieces size of small pie plate. Place one apple on each piece of crust, fill the core with sugar, spice to taste and add teaspoonful of hot water to sugar. Wrap crust about the apple pinching it together, place in hot oven and bake until crust is well cooked; serve hot with hard sauce.

APPLE SLUMP.

Cut apples as for pies and fill a rich undercrust of a good thickness; cover with a thick topcrust and bake in a slow oven for about an hour; when baked remove the top crust, add sugar and spice, and butter half the size of an egg, mix with the apple; then remove part of the apple. Place the top crust in an inverted way upon what remains, and the apple that has been taken out on top of that. Should be eaten hot.

APPLE RICE.

Fill a pudding dish half full with tart apples, pared, quartered, and sprinkled thickly with sugar, and a grating of nutmeg. Wash thoroughly half a cupful of rice and sprinkle over apples in pudding dish. Steam until rice is tender. Serve with cream and sugar.

APPLE CREAM.

Place in an enamelled pan with a wineglassful of water, one pound and a half of minced apple, half a pound of pulverized sugar, the finely minced rind of half a lemon, and a quarter of an ounce of ginger powder; simmer gently till soft enough to pass through a

sieve. When cold, beat in thoroughly one pint of cold fresh cream, or new milk which has previously been brought to a boil, and sweetened.

APPLE FLUMMERY.

To two pounds of peeled and cored apples add one pound of sugar, and the minced rind of a fresh lemon; place in an enamelled pan, cover with water and steam till quite soft, strain and beat the fruit to a pulp. Boil in the strained liquor one ounce of Irish moss for fifteen minutes, strain the liquor again, and add the crushed fruit, simmer for three minutes, turn into a chilled and wet mould. Let stand until solid and well chilled. Serve with cream.

SHORT CAKES.

Take one quart of flour, one teaspoonful of salt, one pint of rich sour cream; dissolve one teaspoonful of soda in a little boiling water and stir into the cream; dissolve one tablespoonful of butter and add to cream; then stir in flour, roll out as you would for biscuit; bake in round pan in two layers, spreading butter between the layers; when baked, take apart and spread with any prepared fruits.

If preferred, sweet milk and baking powder may be used in place of the sour cream and soda. And the following is an excellent receipt:

RACHEL'S SHORT-CAKE.

Two cupfuls of flour, one third cupful of butter, two well rounded teaspoonfuls of baking powder, one cupful of milk, one half teaspoonful of salt. Roll in two layers one half inch thick, butter well between layers and on the top and bake.

STRAWBERRY FILLING.

Mash one quart of strawberries in an earthen dish, add sufficient sugar to make a rich sweetness, set the dish in the oven until the dish is heated through, butter each half of the short-cake, covering with the crushed fruit, and putting a liberal supply on top, sprinkle with pulverized sugar, and serve with cream.

ORANGE FILLING.

Get small, tart, juicy oranges, pare half dozen or more, carefully remove all the white, and slice; take out all the seeds and tough fibre; then crush with enough sugar to make very sweet.

Place in agate saucepan and set on back of range to get thoroughly hot; butter the short cake liberally and apply filling between layers and on top; serve with whipped cream.

CRANBERRY FILLING.

Wash the berries and pick them over carefully; cook in agate saucepan with water enough to float over a moderate fire; mash through a colander; then add sufficient sugar to make very rich and sweet; set back on range until sugar is thoroughly dissolved; butter short-cake liberally and apply filling between layers and on top.

PINEAPPLE FILLING.

Get a ripe pineapple; pare and slice; then shred with a silver fork; cover thickly with sugar, and set away for three or four hours; then set on range in an agate kettle to heat thoroughly; butter short-cake liberally, and apply filling between layers and on top; serve with whipped cream. Canned pineapple may be used, though the fresh fruit is best.

BANANA FILLING.

Slice three bananas and one orange, grate the outside rind of the orange and mix with one cupful of sugar, and juice of orange; pour on the sliced bananas. Butter the short-cake and fill with the fruit thus prepared. Serve plain, or with whipped cream.

ICES.

WATER ICES.

The simplest way of making fruit ices is much the best. Take one pint of water to one quart of fruit juice, sweetened to taste; and it should be remembered the sugar is less apparent in the frozen mixture than in the liquid. This proportion holds for all fruit ices; except the lemon. The lemon prepare as you would a rich lemonade, adding the well beaten whites of two eggs to each quart of the mixture. Be careful to freeze smoothly and the ices will be delicious. I especially recommend strawberry, pineapple, apricot, orange and lemon.

UNCOOKED CREAM.

To one quart of cream, add one teaspoonful of vanilla flavoring, and one cupful of sugar. If you have a freezer that stirs with the triple movement in freezing, it is unnecessary to whip the cream. Otherwise it should be partially whipped before being placed in freezer.

FRENCH CREAM.

Scald one pint of milk in double boiler; beat two eggs with one cupful of sugar until light; then whip in two tablespoonfuls of flour; turn into hot milk and stir until it thickens, cook fifteen minutes and set away to cool. When cold add one quart of whipped cream, and one cupful more of sugar with one tablespoonful of vanilla flavoring; freeze.

CHOCOLATE CREAM.

To make chocolate cream add to the above, when the custard is being prepared, one ounce of dissolved sweet chocolate that has been cooked to a gloss with one tablespoonful of boiling water and two tablespoonfuls of sugar. Omit the second cupful of sugar usually added with cream.

WACHTMEISTER PUDDING.

Fill a mould with alternate layers of sponge cake and jam,--strawberry or apricot, are preferable,--then saturate with rich cream flavored with vanilla and sweetened. Freeze in moulds. Custard may be used in place of cream.

FROZEN FRUITS.

To one pound of mashed fruit, add whites of three eggs, and one pint each of sugar and water. Make a syrup of the sugar and water; when cool, add the fruit and freeze.

With sweet fruits like oranges or raspberries, add juice of one lemon and one half cupful more of sugar. The fruit is very nice, without the addition of the eggs.

PINEAPPLE SHERBET.

To one quart of grated pineapple pulp, add juice of two lemons; dissolve one and one half pounds of sugar in one pint of water, and bring to a boil, skim and cool; when cold, add the fruit pulp, and the well whipped whites of two eggs; freeze soft.

STRAWBERRY SHERBET.

Crush a pound of picked strawberries in a basin and add a quart of water with a sliced lemon, let stand for three hours; put one and one quarter pounds of sugar into another basin, cover the basin with a cheese cloth and pour the berry juice through it. When the sugar is fully dissolved strain again. Freeze soft.

CONFECTIONS.

CANDY DOUGH.

To the white of one egg placed in a glass add equal quantity of cold water, or better yet, rich, sweet cream, and one teaspoonful of vanilla extract. Beat thoroughly; then stir in gradually enough confectioner’s XXXX sugar to make stiff. Cover with damp napkin and use as needed for the following varieties:

CHOCOLATE CREAMS.

Mould small pieces of candy dough into the shape of thimbles, put them on a buttered pan or paraffine paper in a cool place to harden. Melt two squares of sweet chocolate in a saucer over a tea kettle. When the cream balls are sufficiently hard, dip them in the melted chocolate. Use two forks. Let the candies drain on the forks, then put them on the tins again to dry.

CREAM WALNUTS.

Break pieces of candy dough to the size of a nutmeg, roll them in the palm of the hand until smooth and round. Press halved walnut meats on each side, letting cream show between.

CREAM ALMONDS.

Mould almond nut into center of a small ball of candy dough. Roll in granulated sugar and set away to dry.

CREAM NUT CAKE.

May be made by stirring chopped nuts into candy dough, then rolling into sheets about three fourths of an inch thick and cutting into squares.

CREAM DATES.

Wash and dry dates, remove the stones, and fill with candy dough, then roll in confectioner's sugar.

ORANGE CREAMS.

Take the white of one egg and an equal quantity of orange juice, and grated yellow rind of one orange, mix with confectioner's sugar until a stiff dough. Mould in shapely lumps and roll in granulated sugar. This also serves for orange flavored filling for chocolate drops. Any fruit juice can be used in this same way. Any flavor desired that cannot be obtained readily from fresh fruit can be had by using extract with white of egg and cream base.

CHOCOLATE ANNAS.

To three cupfuls of white sugar, add one cupful of milk and one fourth teaspoonful of cream of tartar, boil about nine minutes, or until it will form a soft ball when dropped into cold water; then add two squares of melted chocolate and one tablespoonful of butter. Cook one minute longer. Remove from fire, add one teaspoonful vanilla extract, beat vigorously for one minute, then pour into buttered pans. When cool mark in squares.

MOLASSES CANDY.

Two cupfuls of molasses, one cupful of sugar, one teaspoonful of vinegar, one tablespoonful of butter. Boil until it is brittle when tried in cold water. Pour in a buttered tin; when cool pull until white.

BROWN BETTIES.

Two cupfuls of brown sugar, half a cupful of milk, boil about four minutes, stirring constantly; when almost done stir in three quarters of a cupful of chopped walnuts or chopped blanched almonds; remove from the fire and stir till it grains, and looks sugary, then pour into a well oiled tin to the depth of half an inch; when it cools mark off in squares with a knife.

LEMON MINTS.

Sift a quantity of confectioner's sugar into a bowl and work into it lemon juice until all sugar is absorbed, then add water, a very little at a time, until a smooth, stiff paste is formed. A bit of the lemon peel may be grated into it. Roll into balls and flatten, placing them in the oven a moment to harden.

SOFT CARAMELS.

One quart of brown sugar, half a pint of milk, one third cupful of butter, and half a cake of chocolate. Boil about nine minutes, but not so long that you cannot pour them into the pan. Mark into squares.

BUTTER SCOTCH.

Two cupfuls of light brown sugar, one cupful of butter, one tablespoonful of lemon juice and one of water. Mix all together and boil twenty minutes, add one fourth teaspoonful of baking soda, drop a little in water and if it is crisp it is ready to take off. If not, cook longer; when done, pour into a flat buttered tin.

MARSHMALLOWS.

Three ounces of gum-arabic, half a pint of hot water, half a pint of powdered sugar, the white of one egg, flavoring. Dissolve the gum-arabic in the water, strain, and add the sugar. Boil ten minutes or until the syrup has the consistency of honey, stirring all the time. Add the egg, beaten stiff, and as soon as thoroughly mixed remove from the fire; add flavoring to taste, orange flower or rose is generally used. Pour the paste into a pan dusted with corn starch. The paste should be spread one inch thick. Cut into squares when cold, and roll in powdered sugar.

CHOC-O-POP.

Have ready a mixture made of one cupful of sugar, one half cupful of molasses and one cake of chocolate, cooked until it nearly crisps in cold water, keep warm. Pop corn enough to fill a three quart bowl, turn into a big pan and mix with the candy.

CRACKER-JACK.

Is made in the same way, only use one third sugar to two thirds molasses and omit the chocolate.

FROSTED FRUITS.

Carefully pick over and wash the fruit, such as cherries, plums or strawberries. Whip the whites of two or three eggs, according to quantity of fruit; dip the fruit in beaten egg, drain (keep the eggs well beaten) then dip fruit into powdered sugar. Cover a pan with a sheet of white paper, place the fruit on glass dish; dry, chill, and serve.

STUFFED DATES.

Wash and carefully dry the dates by placing them in a colander and letting stand in warm place; remove the stones and insert half a pecan, or one fourth of an English walnut; roll in confectioner’s sugar.

SALTED ALMONDS.

Blanch half a pound of almonds by pouring over them one pint boiling water; let stand three minutes. Drain and cover with cold water. Remove the skins and dry the almonds on a towel. Fry in hot butter. Drain on brown paper, and sprinkle with salt.

BUTTER SCOTCH.

One cupful of sugar, one cupful of molasses, half a cupful of butter, nearly one tablespoonful of vinegar, a pinch of soda; boil until done; when cold, cut into squares and wrap in paraffine paper.

CARAMELS.

One cupful of molasses, one half cupful of milk, one cupful of sugar, one teaspoonful of flour, one tablespoonful of butter, one fourth pound of chocolate; boil until it will harden when dropped in cold water, then add a few drops of glycerine and one teaspoonful of vanilla; turn into a buttered pan, when partly cool, mark in squares.

COFFEE CREAM CARAMELS.

Melt two pounds of sugar with as little water as possible; when the sugar begins to bubble, pour in slowly one teacupful of rich cream and stir carefully; add two ounces of fresh butter and the extract from two ounces of coffee, stirring gently and continuously while adding. As soon as cooked sufficiently to be brittle when dropped in cold water, pour into buttered tin dish, and when nearly cooled, mark off with a buttered knife into squares.

CHOCOLATE CARAMELS.

Cream together one teacupful of sugar with half the quantity of butter; add one fourth of a pound of grated chocolate and one teacupful each of molasses and milk. Beat well together and boil until a portion of it dropped in ice-water sets and cracks. Pour into well buttered tin pans to the thickness of half an inch. When nearly cold mark into squares with a buttered knife.

LEMON CANDY.

Put one pound of sugar into a pan or kettle with half a pint of water and a third of a teaspoonful of cream of tartar; let it boil, and when a little of it dropped in cold water becomes brittle it is done; pour into a shallow buttered dish. When cooled sufficiently to be handled add one third of a teaspoonful of tartaric acid with the same quantity of extract of lemon, and work thoroughly into the candy until the acid has been evenly distributed. If worked too much the transparency of the candy may be destroyed.

COCOANUT DROPS.

Grate one cocoanut and add to it one half its weight in sugar and the white of an egg whipped to a stiff froth. Mix all together thoroughly and drop on buttered white paper in a pan. Bake for fifteen minutes.

KISSES.

Beat the whites of four eggs to a stiff froth and stir in half a pound of confectioner's sugar, flavor with one half teaspoonful of vanilla. Whip thoroughly and then drop in quantities about half the size of an egg on buttered paper, well separated; lay the paper on a half inch board and place in moderate oven. Watch carefully and when they begin to color take them out, remove from paper and join them in pairs by their flat surfaces.

BEVERAGES.

TEA.

Tea should be made with the little filagree silver balls that come especially for that purpose. Fill ball with best quality Oolong, or English Breakfast, tea that you can obtain (cheap teas are injurious and tasteless). Have a pot of boiling water, fill your cup and then immerse the tea ball in cup until the strength desired is obtained. Serve with sugar and sliced lemon, after the Russian fashion; it is more wholesome than with cream.

COCOA.

Allow one teaspoonful of cocoa and sugar to one cupful of milk and water, in equal proportions. Heat the milk in double boiler. Put the water in the cocoa pot, when it boils stir in the dry cocoa, mix well. After boiling three minutes, add the hot milk. Serve when it begins to rise in the pot.

FRENCH COFFEE.

Three pints of water to one cupful of ground coffee. Put coffee in bowl; pour over it about half pint cold water and let stand for fifteen minutes; bring remaining water to a boil. Take coffee in bowl, strain through fine sieve, then take French coffee pot, put coffee grounds in strainer at top of French pot, leaving water in bowl. Then take boiling water and pour over coffee very slowly. Then set coffee-pot on stove for five minutes; do not let boil. Take off and pour in cold water from bowl that coffee was first soaked in, to settle. Serve in another pot. The French, who have the reputation of making the best coffee, use three parts Java to one part of Mocha.

AMERICAN COFFEE.

Allow one tablespoonful of ground coffee to each cupful of water used; mix coffee with half the white of one egg; add one cupful of cold water and shake well, then add as many more cupfuls of cold water as you have allowed for. Place on back of range and steep ten minutes, then bring forward. Let come to a boil. Settle with one half cupful of cold water.

CARAMEL COFFEE.

To prepare, take three and one half quarts of bran, add one and one half quarts of corn meal, one pint of molasses, one half pint of boiling water, mix well, and bake, stirring often. Make the same as "American Coffee," only let boil a little longer.

CHOCOLATE.

Melt dry, over steam, one half cake of sweet chocolate; bring to a scald one quart of rich milk, add one cupful of sugar, turn into a heated bowl, then add the melted chocolate and whip with egg beater until chocolate is thoroughly dissolved in the milk. The longer it is whipped the better it will be. Serve with whipped cream.

APRICOT WATER.

Skin twelve apricots, take out the stones, pour on one quart of boiling water; allow them to stew for one hour, then strain off the clear liquid and sweeten with three ounces of sugar.

GINGERADE.

Gingerade is made of any fruit, stewed with pulverized ginger, flavored with lemon juice, and carefully strained.

GRAPE JUICE.

Wash and remove from stems ten pounds of grapes, put over to boil with two quarts of water. Let boil until seeds and pulp separate. Strain through cheese cloth bag, let it drain slowly, do not squeeze. Put juice back in kettle, let come to a boil, and add one and one fourth pounds of sugar; boil two or three minutes. Seal boiling hot. The secret of success in bottling grape juice is to have everything boiling hot, jars, juice, rubbers, and tops. The best way is to have jars in kettle of boiling water right on the stove and tops in boiling water, likewise, and fill right from kettle of boiling juice on the stove. Then if your cans are air-tight the juice will surely keep.

FRUIT JUICES.

The following rules hold good for any kind of fruit: Crush the small fruits raw, strain, add one half pound of sugar to each quart of juice, let boil one minute, and bottle, using same precautions as those specified in receipt for grape juice.

PINEAPPLE FRAPPÉ.

Boil one quart of water, one pint of sugar, and one pint of chopped pineapple for twenty minutes; add one cupful of orange juice and one half cupful of lemon juice. Freeze soft.

ORANGE FRAPPÉ.

Make a syrup by boiling one quart of water and one pint of sugar for twenty minutes; add one pint of orange juice and the juice of two lemons; one cupful of candied cherries should be added just before freezing. Freeze soft.

ENGLISH MARMALADES.

RHUBARB MARMALADE.

Peel and cut into inch pieces tender young rhubarb, to every pint allow one pound of loaf sugar and three oranges. Spread the cut rhubarb on a shallow dish and cover with the sugar; leave it for twelve hours; then put it into the preserving kettle with the grated yellow rind of the oranges (be careful not to use any of the white pulp or it will make the preserve bitter), add the tender, juicy pulp of the oranges and boil slowly for about one hour, or until jam sets when tested on a cold plate.

ORANGE MARMALADE.

To every pound of sliced oranges (one half Seville and one half sweet) add three pints of cold water; let stand in a cool place for forty-eight hours; then boil all together until tender, generally about two hours; set away for twenty-four hours. Then weigh the fruit and to every pound of the boiled fruit add three fourths of a pound of sugar. Boil until it will “set” when tried on a chilled plate.

LEMON MARMALADE.

Pour a scant quart of boiling water over two pounds of sugar and let it stand until dissolved. Put in agate preserving kettle and peel some very thin, thread-like strips of the delicate yellow rind of the lemons; add to the liquid; carefully peel and remove all fibrous parts from six large lemons, collect the seeds, tying them in a thin cloth; add the pulp and the little bag of seeds to syrup, keep kettle uncovered and let preserve boil gently. When it “sets” on a chilled plate it is done. The seeds used in this way make it jell much more quickly and the marmalade is more delicate in flavor.

APRICOT MARMALADE.

Choose deep yellow apricots, not too ripe; take off the skin, take out the stones, and extract the kernel. To each twelve pounds of fruit add eight pounds of sugar, put in agate kettle, and boil until it will “set” by dropping into a chilled plate. It needs to be stirred frequently and carefully watched to prevent burning.

INVALID COOKERY.

PEA SOUP.

One pint of fresh, or one can of marrowfat peas; boil until thoroughly soft so they will mash easily; then strain through a sieve to remove skins. To pulp and liquor add one pint of cream, one teaspoonful of sugar, salt and pepper to taste, and one tablespoonful of butter. Serve with wafers. This is a very nutritious and relishable soup for a convalescent.

MILK TOAST.

Brown delicately a thin slice of stale bread, cut in strips and place in bowl; to one cupful of rich milk, brought to a scald, add a teaspoonful of butter, have ready one heaping teaspoonful of flour blended with water, strain into scalding milk and stir until it thickens, set back and let cook gently while you whip the white of one egg to a stiff froth, add a pinch of salt, then take the simmering milk from the stove and whip the beaten white of egg in quickly. Pour over toast in bowl and serve at once.

CUP CUSTARD.

Allow one egg and three fourths of a cupful of rich milk for each cup, sweeten to taste and flavor with grated nutmeg, or vanilla extract, as you prefer, pour in cups, set cup in shallow tin half filled with water, and place in oven; bake until solid, and knife blade can be drawn out clean. Cooking in the pan of water prevents custards from separating and becoming watery.

RICE FOAM.

Wash one heaping teaspoonful of rice and cook until thoroughly tender in milk; mash through a sieve; add pinch of salt; heat a half cupful of cream to a scald, and stir in the rice. Whip the white of one egg to a stiff froth, and add immediately on removing from the stove. A bit of chopped parsley may be added, if liked. Serve with wafers. This is a pleasant change from sweet gruels, and is very nutritious.

CREAMED GRUEL.

Cook one tablespoonful of rolled oats in scant pint of water; when soft strain through a sieve; add one half cupful of cream; salt to taste, and let come to a scald. Have ready the whites of two eggs beaten to a stiff froth, take gruel from the fire and whip in the eggs, sweeten to taste and flavor with a dash of nutmeg or a few drops of vanilla extract.

EGG GRUEL.

Heat a cupful of milk to 180 F., and stir into it one well beaten egg mixed with one fourth cupful of cold water. Stir constantly for a few minutes until thickened, but do not allow it to boil again. Season with salt, or if preferred, a little loaf sugar.

BARLEY GRUEL.

Wash three tablespoonfuls of pearl barley, drop it into a pint of boiling water and parboil five minutes. Pour the water off and add one quart of fresh boiling water, let it simmer gently from one to three hours, strain, season, and serve. A small piece of lemon rind added to the gruel one half hour before it is done will give an agreeable flavor. Equal quantities of barley gruel and milk make a very nourishing drink; a little lemon juice with sugar to taste is sometimes liked as the flavor for the gruel.

ARROWROOT.

Mix two tablespoonfuls of arrowroot with four tablespoonfuls of cold water; add half a pint of boiling water and boil until it thickens; sweeten to taste and add a little grated nutmeg.

GRAHAM GRUEL.

Mix one tablespoonful of graham meal in four tablespoonfuls of cold water, stir it into a pint of boiling water, cook twenty minutes, salt to taste, and boil ten minutes longer, put a gill of thin gruel into a cup with one half gill of milk or cream, and serve hot.

EGG NOGG.

Beat the yolk of a freshly laid egg with a tablespoonful of sugar until it is light and creamy, add to this one half cupful of milk (hot or cold, as you wish the drink, warm, or chilled), whip in, lightly, the white of the egg, beaten stiff, a light grating of nutmeg, and if mixed cold, a tablespoonful of cracked ice. Serve at once.

EGG AND LIME WATER.

To a wineglass full of lime water, add the stiffly beaten white of one egg. Give this often, in small quantities, to patient. It is excellent in cases of obstinate vomiting and bowel trouble.

APPLE WATER.

Wash and wipe a large sour apple and, without paring, cut it into thin slices. Put them in a bowl with one strip of lemon peel, add one cupful of boiling water, cover and set away to cool, strain when cold, sweeten and serve with cracked ice. Cranberries or rhubarb may be used in the same way.

EGG LEMONADE.

Beat the white of an egg to a stiff froth, mix with it the juice of a small lemon and one tablespoonful of sugar. Add one cupful of ice water and shake thoroughly.

ARROWROOT WATER.

Boil the thin rind of a fresh lemon in one quart of water. When boiling, pour over one tablespoonful of arrowroot previously mixed with a little cold water, stir well, sweeten to taste, and let it boil for five minutes; squeeze in the juice of one lemon.

BARLEY WATER.

One teaspoonful of pearl barley, one half lemon, one quart boiling water, sugar to taste. Wash the barley in cold water, add boiling water, juice of lemon, a bit of rind, let stand, covered, and warm for three hours.

EGG TEA.

Take the white of one egg and beat it to a stiff froth, beat the yolk into it with a scant tablespoonful of sugar, then pour in slowly (beating the mixture all the time) half a cupful of hot milk; flavor with grated nutmeg or vanilla to taste.

TOAST WATER.

Brown nicely in the oven slices of bread, and pour upon them sufficient boiling water to cover. Let them steep until cold, keeping the bowl or dish containing the toast closely covered. Strain off the water and sweeten to taste. Chill by setting dish in bowl of chopped ice.

BARLEY WATER.

Put two ounces of pearl barley into half a pint of boiling water and let it simmer a few minutes. Drain off and add two quarts of boiling water with a few figs and stoned raisins cut fine. Boil slowly until reduced about one half and strain. Sweeten to taste, adding the juice of a lemon and nutmeg if desired.

BAKED MILK.

Put the milk in a jar, covering the opening with white paper, and bake in a moderate oven until thick as cream. May be taken by the most delicate stomach.

FLAXSEED LEMONADE.

Pour on four tablespoonfuls of whole flaxseed one quart of boiling water and add the juice of two lemons. Let it steep for three hours, keeping it closely covered. Strain and sweeten to taste.

IMPORTANT NOTES.

THE WAY TO TEST HOT FAT.

If a bit of dry bread will brown in one minute fat is hot enough for a raw mixture. If cooked mixtures are to be browned the fat should be hot enough to brown a piece of bread in forty seconds. This method however, is only a makeshift and is not absolutely accurate. A thermometer should be used; 380 to 390 degrees is the right temperature for frying vegetable substances. Heat fat slowly.

CELERY FLAVORING.

Clean the green stalks and leaves of celery and dry, place in paper bags to be used for soups and savories when celery is out of season. This can be used in place of the celery seed called for in some receipts.

NUT BUTTER.

Peanuts shelled and well roasted with the skins rubbed off will, when ground, dissolve into a buttery substance which can be spread on bread and made into sandwiches. All kinds of nuts reduced to flour can be readily digested and can be placed on the table to be eaten with bread or spread on sandwiches.

BAY LEAVES.

Bay leaves contribute a most delicate and pungent flavor to soups, savories and gravies. They can be obtained at any druggist’s, and five cents worth will last a long time.

SUBSTITUTES FOR INGREDIENTS IN NON-VEGETARIAN RECEIPTS.

SUET.

In place of suet use bread crumbs soaked in oil or butter.

MEATS.

Use nuts as substitute for meats. To prepare the nuts for cooking, pick from the shell carefully and chop very fine, or better yet, grind in nut mill.

GELATINE.

In place of gelatine, use Irish Moss or corn starch.

MEAT FATS.

Nut butter takes the place of meat extract and fats in gravies and sauces. Where plain butter is preferred with a savory flavoring of herbs, always brown the flour used for thickening.

PASTRY.

Cocoanut or cow’s butter is the substitute for lard or cotoline in vegetarian pastry.

HERBS.

The value of herbs for savories and soups is too little understood by American cooks. Here is “Aunt Susan’s” receipt for a “soup powder” that will flavor any soup, gravy, or savory dish with a fine flavor:

SOUP POWDER.

Sweet Marjoram--Powdered, two ounces. Parsley--Powdered, two ounces. Summer Savory--Powdered, two ounces. Thyme--Powdered, two ounces. Bay Leaf--Powdered, two ounces. Lemon Peel--Powdered, one ounce. Sweet Basil--Powdered, one ounce. Rosemary--Powdered, one ounce.

TO PREPARE ONIONS FOR SALADS OR FILLINGS.

Peel and slice, or chop, cover the onions with boiling water, and let stand three or four minutes, drain and put in ice water, let stand ten or fifteen minutes, or, until crisp. The onions are just as crisp as before, and much more delicate.

THE WAY TO DRY CORN.

Just scald, then cut from the cob, put in a pan and set over kettle of boiling water; stir frequently, and in a couple of hours the corn will be almost dry, if the water in kettle has been constantly kept at boiling. Set in warm oven half an hour and the corn is ready to put in bags; dry and clean.

WEIGHTS AND MEASURES FOR COOKS.

1 pound of wheat flour is equal to 1 quart 1 pound and two ounces of Indian meal make 1 quart 1 pound of soft butter is equal to 1 quart 1 pound and 2 ounces of best brown sugar make 1 quart 1 pound and 1 ounce of powdered white sugar make 1 quart 1 pound of broken loaf sugar is equal to 1 quart 4 large tablespoonfuls make ½■ gill 1 common-sized tumbler holds ½■ pint 1 common-sized wine glass is equal to ½■ gill 1 tea-cup holds 1 gill 1 large wine glass holds 2 ounces 1 tablespoonful is equal to ½■ ounce

COLORING FOR SAUCES AND SOUPS.

Crush a quarter of a pound of loaf sugar to powder, put it into a sauce pan with a tablespoonful of water, and stir it unceasingly over a gentle fire until it begins to acquire a little color. Draw it back and bake it very slowly, still stirring it, until it is almost black, without being in the least burnt. It will take about half an hour. Pour a quart of water over it, let it boil for a few minutes until the sugar is quite dissolved, pour it out, and when cold, strain it into a bottle and store it for use. A tablespoonful of this browning will color half a pint of liquid.

BOILING VEGETABLES.

It is very essential for health that all the properties of food should be retained in the cooking, therefore the habit of boiling the various vegetables, in an unnecessary quantity of water, and then draining this down the sink, is a means of defrauding the organism of the nourishment originally contained in the article.

Potatoes, carrots, parsnips, and other articles requiring their skins to be removed for serving or mincing, should, when possible, be steamed “in their jackets” and peeled as much as necessary afterwards.

Cauliflowers, cabbage, &c., are excellent when steamed. Green peas, beans, and such, should be put in a covered vessel, with a little butter, and, when necessary, a spoonful or two of water, and gently stewed, standing inside a saucepan of water without the water touching them; or they can be stewed in the oven in an earthenware jar, with a little butter and a spoonful or two of water. This method of cooking takes very little longer time than the ordinary boiling in water. The oven should be moderately heated.

STEWING FRUITS.

Fruits are better stewed in a double enamelled saucepan, or baked in a tightly covered earthen jar in the oven with as little water as possible.

Dried fruits, such as raisins, figs, dates, &c., should be washed and picked over carefully, then soaked for several hours in cold water till they are soft and swollen to their fullest extent, when they should be stewed in the same water.

USE OF SALT.

As little salt as is palatable should be used, and an effort made to daily lessen its use. When once the system is freed from the use of this mineral in its daily food, a small dose shows it to be an active poison. There is enough of natural salts in our vegetable foods without our making use of the mineral deposit. Knowing that many will use this book who are just turning from the meat diet, we give, as a rule, the usual quantity of salt in the receipts used in ordinary cookery. For the same reason we give the ordinary beverages in daily use, in the menus.

BEVERAGES.

Fruit juices are far more conductive to good health than tea or coffee, and we especially recommend lemon juice diluted with boiling water as a breakfast beverage, though we have not ventured to place it on the regular bill of fare. It is a most appetising morning drink, and should be taken a short time before eating.

MENUS FOR ONE WEEK.

BREAKFAST--MONDAY.

Chinese Rice with Cream. Fruit. Boiled Eggs. Creamed Potatoes. Whole Wheat Muffins. Lemon Marmalade. Coffee.

LUNCHEON--MONDAY.

Bean Soup with Nouilles. Toast. Boiled Egg Sandwiches. Jelly. Gingerade.

DINNER--MONDAY.

Cream of Tomato. Steamed Sweet Potato. Celery on Toast. Macaroni and Cheese. Lettuce with Mayonaise. Whole Wheat Bread. Fruit Pie. Stuffed Dates. Grape Juice.

BREAKFAST--TUESDAY.

Fruit. Whole Wheat with Cream. Savory Hash. Warmed Sweet Potatoes. Griddle Cakes. Syrup. Coffee.

LUNCHEON--TUESDAY.

Cabbage Soup. Baked Potatoes. Fried Apples. Corn Muffins. Preserves. Oolong Tea.

DINNER--TUESDAY.

Soup. Cream of Celery. Mashed Potatoes. Omelet with Peas. Wax Beans. Tomato Aspic on Lettuce with Mayonaise Dressing. Cabinet Pudding. Coffee.

BREAKFAST--WEDNESDAY.

Breakfast Food with Cream. Stewed Raisins. Creamed Potatoes. Shirred Eggs. Toast. Tea or Coffee.

LUNCHEON--WEDNESDAY.

Dutch Soup. Wachtmeister Potatoes. Hot Biscuit. Apricot Sauce. Tea.

DINNER--WEDNESDAY.

Soup. Cream of Carrot. Escaloped Tomatoes. Rice and Cheese. Parsnip Balls. Potato Salad. Apricot Tapioca. Cake. Coffee.

BREAKFAST--THURSDAY.

Oat Meal with Cream. Corn Fritters. French Fried Potatoes. Stewed Prunes. Whole Wheat Muffins. Tea.

LUNCHEON--THURSDAY.

Corn on Toast. Lyonaise Potatoes. Cheese Puffs. Whole Wheat Bread and Butter. Cake. Peaches. Cocoa.

DINNER--THURSDAY.

Clear Soup with Nouilles. Escaloped Potatoes. Vegetable Cutlets. Lima Beans. Celery Salad. Apple Dumplings. Hard Sauce. Nuts and Raisins. French Coffee.

BREAKFAST--FRIDAY.

Fruit. Breakfast Food with Cream. Potato Balls. Fried Tomatoes. Corn Cakes with Syrup. Caramel Coffee.

LUNCHEON--FRIDAY.

Welsh Rarebit. Baked Potatoes. Stewed Tomatoes. Oat Meal Pudding. Tea.

DINNER--FRIDAY.

Corn Chowder. Escaloped Potatoes. Devilled Tomatoes. Mushroom Pie. Cheese Relish. Banana Short Cake. Fruit Juice.

BREAKFAST--SATURDAY.

Fruit. Oat Meal with Cream. Milk Toast. Baked Potatoes. Bread Griddle Cakes. Jam. English Breakfast Tea.

LUNCHEON--SATURDAY.

Rice Soup. Creamed Potatoes. Escaloped Eggs. Honey and Waffles. Chocolate.

DINNER--SATURDAY.

Split Pea Soup. Lyonaise Potatoes. Nut Loaf. Wax Beans. Salad of Lettuce and Grape Fruit. Apple Pie. Cheese. Coffee.

BREAKFAST--SUNDAY.

Fresh Fruit. Porridge with Cream. French Fried Potatoes. Boston Baked Beans. Brown Bread. Coffee.

DINNER--SUNDAY.

Julienne Soup. Welsh Rarebit. Corn on Toast. Baked Sweet Potatoes. Mushroom Pie. Nut Salad. Orange Foam. Lady Fingers. Coffee.

SUNDAY NIGHT LUNCH.

Russian Sandwiches. Celery Salad. Cake and Fruit. Grape Juice.

MENUS FOR PLAIN LIVING.

BREAKFASTS.

Breakfast Food. Marmalade. Creamed Potatoes. Whole Wheat Griddle Cakes. Syrup. Coffee.

Breakfast Food with Cream. Spanish Eggs. Rice Fritters. Graham Gems. Apricot Marmalade. Tea.

Fruit. Graham Porridge with Cream. Corn Muffins. Vegetable Sausages. Lyonaise Potatoes. Chocolate.

Grapes. Rye Porridge with Cream. Boiled Potatoes. Vegetable Cutlets. Whole Wheat Muffins. Coffee.

Apples. Whole Wheat Porridge with Cream. Baked Potatoes. Fried Corn Mush. Lemon Marmalade. Pop Overs. English Breakfast Tea.

Bananas. Oat Meal with Cream. Potato Pancakes. Toast. Scrambled Eggs. English Breakfast Tea.

Oranges. Chinese Rice. Shirred Eggs. Creamed Potatoes. Pop Overs. Coffee.

Porridge with Cream. Savory Hash. Orange Marmalade. Muffins. Chocolate.

Fruit. Oat Meal Porridge with Cream. Rice Griddle Cakes. Maple Syrup. Coffee.

DINNERS.

Soup. Cream of Asparagus. Omelet with Peas. Lima Beans. Creamed Potatoes. Pop Overs. Rice Pudding. Coffee.

Rice Soup. Vegetable Hash. Escaloped Potatoes. Cabbage Salad. Squash Pie with Cheese. Coffee.

Lentil Soup. Italian Macaroni. Corn Fritters. Lyonaise Potatoes. Apple Tapioca. Coffee.

Baked Beans. Stewed Tomatoes. Baked Sweet Potatoes. Rolls. Apple Dumplings. Coffee.

Escaloped Eggs. Mashed Potatoes. Corn on Toast. Snow Pudding. Coffee.

Sweet Breads with Peas. Mashed Potatoes. Biscuit. Oat Meal Pudding. Coffee.

Tomatoes on Toast. Baked Potatoes. Macaroni and Cheese. Orange Custard on Rice. Coffee.

Bean Puree with Nouilles. Creamed Vegetables. Stewed Tomatoes. Macaroni Pie. Cheese Puff. Fruit. Coffee.

Potato Soup with Dumplings. Cheese Custard. Wafers. Farina Croustades. Potatoes in White Sauce. Sliced Cucumbers. Pineapple Tart. Coffee.

COLD SUPPERS.

Egg Sandwiches. Celery Salad with Cheese Sticks. Coffee Cake. Orange Foam. Iced Tea.

Tomato Salad. Whole Wheat Bread. Nut Sandwiches. Angel Food. Strawberries and Cream. Lemonade.

Boston Baked Beans Cold, Serve with cut lemons. Whole Wheat Bread. Butter. Olives. Cheese. Wafers. Sliced Peaches. Sponge Cake. Chocolate Sandwiches. Grape Juice.

HOT SUPPERS.

Bean Salad. Wachtmeister Potatoes. Waffles with Syrup. Celery. Cheese. Crackers. Coffee.

Tomato Fritters. Baked Potatoes. Cake. Sauce. Chocolate.

Rice Croquettes. Lyonaise Potatoes. Jelly. Pop Overs. Tea.

Savory Hash. Baked Potatoes. Tomato Salad. Honey. Whole Wheat Muffins. Chocolate.

FORMAL LUNCHEONS.

TO THE PUBLIC.

This publication is intended to afford information as to the best food to promote the physical, moral and spiritual welfare without destroying the lives of other sensitive creatures.

FOOD.

Its chief contention is that the fruits, nuts and grains, with a fair proportion of fresh and preserved vegetable productions (with or without the products of animals), are wholesome and pure. That flesh meat contains the germs of diseases to which animals are subject and contain the thick, venous blood, a substance so poisonous that it will cause blood poisoning whenever it comes in contact with the arterial blood of the body. That by avoiding the butcher’s meat and living on the pure foods provided so abundantly

in the Vegetable kingdom a higher degree of health and strength can be obtained; a longer life and greater freedom from irritation and nervous exhaustion, under pressure of business or professional labor.

The principles of humanity towards animals and the effects of pure food in promoting man's ethical and spiritual progress are also discussed in this magazine.

WASHINGTON: GOVERNMENT PRINTING OFFICE. 1916.

LETTER OF TRANSMITTAL.

U. S. DEPARTMENT OF AGRICULTURE, STATES RELATIONS SERVICE,

Washington, D. C., June 10, 1916.

SIR: Since cheese is one of the important agricultural products of the United States and a foodstuff used in a larger or smaller quantity in nearly every American home, it seemed desirable to study its relative nutritive value and the ways in which it may be prepared for the table.

Although it is so generally liked, there seems to be a widespread belief that it is not well digested and that it is a cause of physiological disturbances. Neither of these beliefs is substantiated by the results of the extended series of digestion experiments undertaken as part of the nutrition investigations of the Office of Home Economics. Indeed, cheese was found to be very thoroughly digested, ranking with other staple foods in this respect. Moreover, experiments made with the respiration calorimeter did not indicate that it was less easy of digestion than a comparable amount of meat.

In the studies of the digestibility of cheese the Bureau of Animal Industry cooperated with the States Relations Service and was also of great assistance in securing, for experimental purposes, cheese made and cured under controlled conditions. Supplementing the experiments as to the nutritive value of cheese, many tests were made of methods of preparing cheese for the table, the main purpose being to suggest dishes and combinations of such a character that the cheese might replace other nitrogenous material and fat when this seemed desirable.

The bulletin was prepared by C. F. Langworthy, chief of the Office of Home Economics of the States Relations Service, and Miss Caroline L. Hunt, who has had wide experience in the study of both scientific and practical problems in nutrition. The recipes were collected from many sources and in the majority of cases were studied experimentally by Miss Hunt.

Acknowledgement should be made to teachers of home economics in agricultural colleges and other educational institutions, to housekeepers, and others who have supplied data of great value in preparing the bulletin.

Respectfully, A. C. TRUE, _Director_.

Hon. D. F. HOUSTON, _Secretary of Agriculture_.

Conclusion 38

CHEESE AND ITS ECONOMICAL USES IN THE DIET.

INTRODUCTION.

Cheese is believed to be the oldest of the dairy products and the first form in which milk was preserved for future use. One may conjecture that it owes its origin to the accidental storing and ripening of sour milk curd. Although it has been a staple food with many races for uncounted years, there is a widespread belief that it is suitable for use chiefly in small quantities as an accessory to the diet, and that in large quantities it is likely to produce physiological disturbances. We are inclined, therefore, to think of those who make cheese one of the chief articles of their diet as being driven to this course by necessity rather than being led to it by choice.

Because of these opinions extensive studies have been carried on as a part of the Department Work in Home Economics, of the food value, thoroughness of digestibility, ease of digestion, physiological effect, and special character of cheese as food as well as of methods which are followed in preparing it for the table. The conclusion drawn from this extended study is, in brief, that cheese properly prepared and used is not generally a cause of physiological disturbances, and that it may easily be introduced into the bill

of fare in such quantities as to serve as the chief source of nitrogenous food and may be made a substitute for other nitrogenous foods when such substitution is desired.[1] The results of these studies have been brought together in this bulletin with a view to making them helpful to all interested in the subject, but particularly to housekeepers.

From the standpoint of the housekeeper, cheese is of importance because of its high nutritive value, particularly its high percentage of protein or muscle-forming materials, because of the ease with which it can be kept and prepared for the table, and because of its appetizing flavor and of the great variety of ways in which it can be served.

From the point of view of agriculture cheese is an important commodity. The latest census figures available show that considerably over 300,000,000 pounds are made yearly in the United States, the value of the product being nearly $29,000,000, and the amount of money invested being over $6,000,000. The figures quoted are from the census report which first separated the details of the cheese industry from those of the butter and condensed-milk industries. From earlier statistics available, however, it is fair to judge in a general way of the development of any one of these industries from the figures given for the three industries combined. In general, these figures show that there was a great leap forward in the three industries in the decade between the years 1880 and 1890, and that since that time there has been a continuous, steady, healthy growth in the business of cheese making.

As might be expected, the amount of the product and the amount of money invested have increased more rapidly than the number of men employed, indicating that, as in most manufacturing industries, labor-saving devices and other improvements have reduced the proportion of physical labor required.

As regards the kind of cheese made in the United States, the figures show that of the amount produced in 1905 approximately three-fourths was what is known to the trade as standard factory cheese, or what is usually known to the retail purchaser as American cheese. A very small per cent—1.1 per cent—was skim-milk cheese, the remainder being American modifications of certain important foreign brands, Neufchâtel, Camembert, and others.

From the standpoint of the retail dealer, cheese is important because it is a convenient article to handle. Its percentage of nutrients being high and its percentage of water low, it is not bulky. It is comparatively easy, too, to preserve in good condition. The difficulty of cutting exact amounts called for by customers may be considered the chief inconvenience. Efforts have been made to obviate this difficulty by making small cheeses. Experiments have been reported from the Oregon Experiment Station[2] on the canning of cheese in pound lots; and from the Wisconsin Experiment Station[3] in making cheese prints like those in which butter is commonly sold. In some of the factories cheeses weighing about 5 pounds and having the same shape as the larger cheeses are made. These are convenient for use in families where a large amount of cheese is eaten, and furthermore cheese in such form dries out and spoils less quickly and easily than cheese cut in wedge-shaped slices, as it usually is when sold by the pound. A convenient way of keeping and using such cheese is given on page 11.

The sale of cheese in pots is another way of overcoming the difficulty of cutting exact amounts. Cheese thus prepared is, as a rule, softened by the addition of butter fat or other fat, with the idea of making it of such consistency that it can be used like soft cheeses.

There is something to be said also of the value of cheese to that not inconsiderable number of individuals who must occasionally cater for themselves—those men and women in business life, for example, who find it convenient neither to carry lunches nor to go to restaurants. For these, cheese offers a convenient way of supplying the necessary protein, for it can usually be obtained in good condition in any neighborhood. Combined with crackers, some of the ready-cooked cereals, or bread, and with fruit, it makes a fairly well-balanced meal.

CHEESE MAKING.

Though the chief points in the manufacture of cheese are well known, and are discussed in detail in other publications[4] of this department, it may not be out of place to review them here. Cheese is made ordinarily from whole milk, and most of the kinds best

known in the United States from cows' milk. In every 8 parts of milk by weight there is approximately 1 part of solid nutrients, the remainder being water. For our present purpose we may think of the nutrients as being equally divided into three groups—protein substances (casein and albumin principally), fat, and milk sugar. In the process of cheese making the casein, which constitutes more than three-fourths of the proteids of the milk, is precipitated by rennet, forming a curd. Most of the fat attaches itself to this curd. The curd is broken up, and the whole is heated to a temperature between 96° and 108° F. The whey is drained off and carries with it most of the milk sugar and the albumin. The curd is salted and pressed. It is kept for several weeks or longer in a cool place, where it "ripens," developing flavors through the action of bacteria or other microorganisms, and also undergoing certain other marked changes.

The average cheese while fresh and moist contains proteids and fat in much the same ratio as that in which they are found in the milk. More than one-fourth its weight is proteid, about one-third fats, and one-third water. There are always present small amounts of albumin and sugar which have clung to the curd. Owing to the addition of salt, the percentage of mineral matter is high compared with that of most other foods.

In ripening, cheese changes in texture and its original pastiness gives away to a somewhat granular consistency in some types, or to a waxy or a buttery consistency in others.

The above brief outline refers only to the essentials of cheese making. In practice, there are many variations with respect to the kind of milk used, the proportion of butter fat or cream retained in or added to the milk, with respect to the methods followed in separating, preparing, seasoning, and handling the curd, and to the handling and ripening of the cheese. It follows that there is an almost endless number of cheeses with different names and of different appearance and flavor.

Cheese making was formerly a home or farm industry, but is now, in the United States at least, very largely a commercial enterprise carried on in factories. It differs from many industries in that the factories are almost always located in the country or in the smaller towns rather than in large cities, this being more true of cheese making than of the manufacture of potted cheeses or other special articles, which has become a large industry. It is worthy of mention in this connection that the making of cheese crackers and other bakers' goods in which cheese is an ingredient has developed into an important part of the baking trade.

KINDS OF CHEESE USED IN AMERICAN HOMES.

The American factory cheese—the so-called American cream cheese—is of the English Cheddar type, and as it is the most commonly used of all the commercial varieties in the United States, may be taken as a standard. Other types are, however, well known, particularly in cities and large towns where there are well-stocked markets and stores, and it is interesting to note also, at least briefly, the characteristics of some of them. Full descriptions of a very large number of cheeses (about 250 in all) may be found in an earlier bulletin of this department.[5]

CHEDDAR AND AMERICAN FULL-CREAM CHEESE.

Cheddar cheese—named from the English village where it originated—is a comparatively old type of cheese, very popular in England and also in the United States. The name is now more fitly applied to a process than to any particular shape.

Cheddar cheese is made from sweet cows' milk, which may be skimmed, partly skimmed, or unskimmed. If made from unskimmed milk the cheese is called "full cream." If cream is removed the cheese is designated "part-skim" or "skim," as the case may be.

Cheese of Cheddar type as made in the United States is perhaps most often marketed in large, flat, round forms, 13 to 16 inches in diameter, about 5 or 6 inches in height, and weighing 26 to 32 pounds each, though other shapes and sizes are also fairly common. It is usually pale to darker yellow in color, though it may be white when uncolored. When fresh it is mild in flavor, but when well ripened has a characteristic and sharp taste. The new cheese is soft, though not waxy, in texture, and may be easily shaved or broken into small pieces. When well ripened it may be finely grated.

These characteristics, together with its distinctive and peculiar flavor and its wide distribution in the markets, are qualities which help to make it the variety most commonly used in the United States.

Sage cheese is a variety of Cheddar cheese, which is flavored with sage and is further characterized by the green mottled appearance formerly due to bits of sage leaf but now generally obtained in another way.

ENGLISH DAIRY CHEESE.

From the standpoint of the cook who frequently wishes to use grated cheese this variety is important. Though made in much the same way as Cheddar, it differs from it, in that the curd is heated to a somewhat higher temperature, and the cheese is therefore harder. It commonly sells for somewhat more per pound than the standard or American factory variety and is likely to be found only in the larger markets.

SOFT CREAM CHEESES.

Cream cheese true to name is made from rich cream thickened by souring or from sweet cream thickened with rennet. The whey is removed by draining. It is then covered, salted, and turned occasionally, being ready for market in 5 to 10 days. A variety is also made with rennet from cream of low fat content, as well as a number of other special sorts much more common in France than in the United States.

The term “cream cheese,” however, is an elastic one and includes many varieties which are sold under special trade names. Such cheese is common in most markets.

Soft cream cheese differs from standard cheese, so far as composition is concerned, in having more water and fat and less protein, water usually making up about one-half of the total weight. It differs also in being much more perishable. These cheeses commonly sell for 10 or 15 cents each, which is about 40 to 50 cents a pound.

Of late there have been on the market varieties of such cheese or of Neufchâtel, made by combining the cheese with chopped pimiento. These bring a relatively high price in market and may be easily prepared at home if this seems more convenient. (See p. 34.)

NEUFCHÂTEL CHEESE.

This very popular variety—named from a town in northeastern France—is similar in appearance and in the way it is marketed to soft cream cheese. It is made either from whole or skim milk curdled with rennet. After draining and pressing, it is kneaded thoroughly, formed into small rolls or blocks, and then ripened until special molds develop, which requires about four weeks. It is then wrapped in tinfoil and marketed.

PARMESAN CHEESE.

This is a name given outside of Italy to a very hard cheese which in that country is said to be known as Grana, a name given because of the granular appearance which it has after it has been broken. It is sometimes sold in grated form and brings a relatively high price, but is more commonly sold ungrated. When well made it will keep for years and may be easily broken and grated. It is very generally used in Europe for serving with soups, for seasoning macaroni, and for other similar purposes, and is quite common in American markets.

SAP SAGO.

This is a skim-milk cheese made in Switzerland, which is suitable for grating. It contains, for every 4 pounds of cheese, 1 pound of a clover (_Melilotus cæruleus_) grown in Switzerland. It is greenish in color and has an unusual flavor. It is not high-priced.

GORGONZOLA AND ROQUEFORT.

These are highly flavored cheeses characterized by the presence of molds through their entire mass. Roquefort is made from the milk of sheep; Gorgonzola, from cows’ milk.

POTTED OR SANDWICH CHEESES.

Ordinary cheese is often mixed with butter or oil in the proportion of 5 parts of cheese to 1 of butter or oil, by weight. The mixture is sometimes seasoned with mustard or with curry powder. Such cheeses, unseasoned or seasoned, are on the market in great

variety. Potted cheese may be easily prepared at home if the housekeeper wishes to take the trouble.

SWISS CHEESE (EMMENTALER, GRUYÈRE, ETC.).

This term as used in America is somewhat vague. Different names are given to the varieties according to the districts of Switzerland in which they are made, but they are all similar and characterized by a mild, sweetish flavor and the presence of large holes or “eyes.” Foreign and domestic brands are to be found in most markets. They are suitable for cooking purposes, as well as for use without being cooked, and are much used in this way in Europe and well known and liked in the United States.

EDAM CHEESE.

This is a cheese made in Holland. It is molded in spherical form, and the outside is usually dyed red. It is usual in this country to cut off a section of the top, which serves as a lid, and to scoop out the inside as needed. In Holland it is frequently served in slices, particularly when it is fresh. Edam cheese is seldom used in cookery in American homes, though thrifty housewives, after the greater part of the cheese has been removed, often stuff the hollow shell with cooked and seasoned macaroni, rice, or something similar and bake.

BRIE AND CAMEMBERT CHEESE.

These are very soft rennet cheeses of foreign origin and of somewhat smaller nutritive value than standard cheese, and of strong flavor and odor. They are not often used in cookery, but are used as an accompaniment to other foods. The Bureau of Animal Industry and the Connecticut Storrs Experiment Station in cooperation have experimented with the making of Camembert cheese with marked success, and have published a full account of the work.[6]

COTTAGE CHEESE.

Cottage cheese and other sour milk and cream cheeses, junket, Devonshire cream, and a number of other cheese-like products are described in the section which deals with homemade cheese.

[6] U. S. Dept. Agr., Bur. Anim. Indus. Buls. 71, 98, 109, 115, 120, Circ. 145; Conn. Storrs Sta. Buls. 35, 46, and 58.

THE CARE OF CHEESE IN THE HOME.

One of the best ways of keeping cheese which has been cut is to wrap it in a slightly damp cloth and then in paper, and to keep it in a cool place. To dampen the cloth, sprinkle it and then wring it. It should seem hardly damp to the touch. Paraffin paper may be used in place of the cloth. When cheese is put in a covered dish, the air should never be wholly excluded, for if this is done, it molds more readily.

In some markets it is possible to buy the small whole cheeses mentioned on page 6. These may be satisfactorily kept by cutting a slice from the top, to serve as a cover, and removing the cheese as needed with a knife, a strong spoon, or a cheese scoop. It is possible to buy at the hardware stores knobs which inserted in the layer cut from the top make it easy to handle. The cheese below the cover should be kept wrapped in a cloth.

CHEESE AS A FOOD.

Cheese is used in general in two ways—in small quantities chiefly for its flavor and in large quantities for its nutritive value as well as for its flavor. Some varieties of cheese are used chiefly for the first purpose, others chiefly for the second. Those which are used chiefly for their flavor, many of which are high priced, contribute little to the food value of the diet, because of the small quantity used at a time. They have an important part to play, however, in making the diet attractive and palatable. The intelligent housekeeper thinks of them not as necessities, but as lying within what has been called “the region of choice.” Having first satisfied herself that her family is receiving sufficient nourishment, she then, according to her means and ideas of an attractive diet, chooses among these foods and others which are to be considered luxuries.

Those cheeses, on the other hand, which are suitable to be eaten in large quantities and which are comparatively low priced are important not only from the point of view of flavor, but also from the point of view of their nutritive value. Among such cheeses the one which, as noted above, is known to the trade as standard factory cheese and to the housewife as American cheese stands out pre-eminently. Therefore when the word “cheese” is used without specification in the following pages it may be taken to refer to this particular variety.

THE FLAVOR OF CHEESE.

Cheese owes its flavor to the fatty acids and their compounds which it contains and to ammonia-like bodies formed during ripening from the cleavage of the casein, to salt added to the curd, and in some varieties, like Roquefort, to bodies elaborated by molds which develop in the cheese. In the highly flavored sorts some of the fatty acids of a very marked odor are present in abundance, as are also the ammonia-like bodies. Indeed, in eating such cheese as Camembert a trace of ammonia flavor may often be plainly detected.

The cleavage of the nitrogenous material of the cheese and other changes are brought about chiefly by the action of enzymes originally present in cheese or by microorganisms and are to be regarded as fermentative and not as putrefactive changes.

The liking for highly flavored cheeses of strong odor is a matter of individual preference, but from the chemist’s standpoint there is no reason for the statement often made that such cheeses have undergone putrefactive decomposition.

COMPOSITION OF CHEESE AND SOME OTHER FOODS COMPARED.

In the present state of our knowledge concerning dietetics it seems best to give the housekeeper general rather than absolute rules with respect to the kind and amount of food which should be eaten at any meal or at any given time by persons in normal health living under usual conditions. It is not necessary, therefore, for the housekeeper to know the exact composition of food materials in order to cater well for her family, a rough approximation being sufficient for the purpose. In the case of cheese she will be near enough to the fact if she thinks of it as composed approximately of equal parts by weight of proteids, fats, and water. This rough conception is sufficient to associate it in her mind with the foods of high proteid value, a point which is important in connection with the making of bills of fare. It should lead her to class it also with the foods which are rich in fat and prevent her from combining it unnecessarily with other fatty foods.

In order, however, that the question of the use of cheese in the diet may be adequately discussed, knowledge of its composition in comparison with other foods is desirable, and there is an abundance of data available on this subject, since the composition of cheese and other foods has often been investigated at the Department of Agriculture, in experiment station laboratories, and in many other places where nutrition problems are studied. An extended summary of analyses of cheese of different sorts is included in an earlier publication of this department.[7]

Data regarding the composition of cheese and a few other common foods are summarized in the following table:

Average composition of cheese and some other common foods as purchased, and also on the basis of edible portion.

Food materials.	Refuse.	Water.	Protein.	Fat.
	Per cent.	_Per cent._	_Per cent._	_Per cent._
Cheese		34.2	25.2	33.7
Beef of average composition as purchased	18.6	50.5	15.2	15.5
Edible portion		62.2	18.8	18.8
Porterhouse steak as purchased	12.7	52.4	19.1	17.9
Edible portion		60.0	21.9	20.4
Loin steak, broiled, edible portion		54.8	23.5	20.4
Dried beef		53.7	26.4	6.9
Eggs as purchased	11.2	65.5	13.1	9.3
Edible portion		73.7	13.4	10.5
Milk		87.0	3.3	4.0
Bread		35.3	9.2	1.3
Potatoes as purchased	20.0	62.6	1.8	.1
Edible portion		78.3	2.2	.1
Apples as purchased	25.0	63.6	.3	.3
Edible portion		84.6	.4	.5

Food materials.	Carbohydrates.	Ash.	Fuel value per pound.
	Per cent.	_Per cent._	_Calories._
Cheese	2.4	3.8	1,950
Beef of average composition as purchased		.7	935
Edible portion		.9	1,145
Porterhouse steak as purchased		.8	1,110
Edible portion		1.0	1,270
Loin steak, broiled, edible portion		1.2	1,300
Dried beef		8.9	790
Eggs as purchased		.9	635
Edible portion		1.0	720
Milk	5.0	.7	310
Bread	53.1	1.1	1,215
Potatoes as purchased	14.7	.8	295
Edible portion	18.4	1.0	385
Apples as purchased	10.8	.3	190
Edible portion	14.2	.3	290

It will be seen from the above table that cheese has nearly twice as much protein, weight for weight, as beef of average composition as purchased and that its fuel value is more than twice as great. It contains over 25 per cent more protein than the same weight of porterhouse steak as purchased, and nearly twice as much fat.

As shown by the figures in the above table, cheese contains 3.8 per cent ash. Of this a considerable part may be salt added in cheese making. Like the milk from which it is made, cheese ash is characterized chiefly by the presence of calcium (lime), magnesium, phosphorus, and iron, the average values as given in earlier bulletins of the department[8] being 1.24 per cent calcium oxid, 0.049 per cent magnesium oxid, 1.49 per cent phosphorus pentoxid, and 0.0015 per cent iron.

The total amount of the mineral matter needed per day by the body is relatively small, yet mineral matter is very important. It is commonly assumed and is probably true, that a mixed diet reasonably varied and reasonably generous will supply all the ash constituent which the body requires. If for any reason calcium and phosphorus are lacking in the diet, the amounts may be readily increased (as pointed out in one of the publications just cited) by a free use of milk and such milk products as cheese and junket, without decreasing the palatability of the diet or materially increasing its cost.

NUTRITIVE VALUE AND COST OF CHEESE AND SOME OTHER FOOD MATERIALS.

Since the market prices of foods vary, it is difficult to compare the amounts of nourishment secured for a given sum, 10 cents say, in buying different food materials. We may, however, suppose that foods have certain prices and make the comparison on this basis. In the following table the amount of cheese obtained for 10 cents when cheese costs 22 cents a pound is shown, together with the protein and energy value of this quantity, this value being compared with similar values for a number of other common foods at certain assumed prices per pound.

Amounts of protein and energy obtained for 10 cents expended for cheese and other foods at certain assumed prices per pound.

---------- | | | 10 cents' worth will | | 10 cents | contain— Food | Price. | will |---------- materials. | | buy— | | A fuel | | | Proteid. | value of— ----------+----------+----------+----------+---------- | |_Ounces._ |_Ounces._ |_Calories._ Cheese | 22 cents per pound | 7.3 | 1.9 | 886 Beef, average | 20 cents per pound | 8.0 | 1.2 | 467 Porterhouse | | | | steak | 25 cents per pound | 6.4 | 1.3 | 444 Dried beef | do | 6.4 | 1.6 | 315 Eggs | 24 cents per dozen | 10.0 | 1.3 | 198 Milk | 9 cents per quart | 38.3 | 1.2 | 736 Wheat bread | 5 cents per pound | 32.0 | 2.9 | 2,400 Potatoes | 60 cents per bushel | 160.0 | | 2,950 Apples | 1½ cents per pound | 106.7 | | 1,270 ----------+----------+----------+----------+----------

Since cheese is ready to be eaten when it comes from the market, it may be more interesting for some purposes to compare its composition with that of cooked beef, freed from bone and from superfluous fat, such a piece as would be served to a person at the table. Weight for weight, cheese has appreciably more protein than such cooked beef, and 50 per cent more fat.

So far as its composition is concerned, then, cheese is entitled to be considered as directly comparable with meat. The possibilities of using cheese and some other food materials in the same way as meat is discussed in some detail in an earlier publication of this department.[9] It is so used by the peasants of some parts of Europe, and was formerly so used among many other groups of people. The fact that it is not more commonly so used in this country is probably due to several causes. One cause is habit, which makes the meal seem incomplete unless it includes meat; another is the fact that since cheese has a more pronounced flavor than meat, it is not so likely to be generally acceptable as the chief food of a meal. There is always likely to be at least one member of the family who does not relish it in quantity. Another cause is the fact that it is commonly believed to be indigestible, and still another is the fact that housekeepers, through lack of experience, are much less skillful in the arrangement of bills of fare in which cheese is the central food than they are in arranging bills of fare in which meat is thus used. These last two causes will be considered in sections which follow.

FOOTNOTES:

[9] U. S. Dept. Agr., Yearbook 1907, p. 367.

THE DIGESTIBILITY OF CHEESE.

As was stated above, cheese has been thought a cause of digestive disturbances, but work recently done by the Office of Experiment Stations, in cooperation with the Bureau of Animal Industry, and briefly summed up in a recent publication tends to disprove this.[10]

In the large number of experiments which were conducted, young men in good health were fed on a diet consisting of bread and fruit combined with American factory cheese which was made with different amounts of rennet and in different stages of ripening. The results showed that over 90 per cent of the nitrogenous material of the cheese was digested—that is, retained in the body—and nearly 90 per cent of the energy it supplied was available. In other words, cheese compares favorably with other foods in thoroughness of digestion—that is, in the percentage finally digested. Furthermore, it did not cause constipation or other physiological disturbances.

The above statement refers to full-cream cheese. Experiments made at the same time gave practically the same values for the digestibility of skim-milk cheese, of Swiss cheese, of Roquefort and Camembert cheese, and of cottage cheese.

Artificial digestion experiments made at the Minnesota Agricultural Experiment Station[11] indicate that cheese protein is digested by the ferments of the intestines rather than by those of the stomach, and this is suggested as a reason for its reputation as a "hearty" food, the belief being that some foods which remain in the stomach longer than the average time, or are not digested by the stomach, are "hearty." Cheese protein (casein) is intimately associated with fat, and there is experimental evidence to show that this condition has an effect upon the progress of digestion in the stomach.

The burning sensation or similar sensations sometimes experienced after eating certain sorts of cheese has been attributed to the presence of small amounts of free fatty acids.[12] It is commonly said that cheese is difficult to digest, the idea being that the body expends more labor in assimilating it than is required for other comparable foods. Experiments recently carried on by the Office of Experiment Stations in which the respiration calorimeter was used to study the energy expenditure during the period of active digestion, do not indicate that cheese differs materially in ease of digestion from a comparable amount of meat.[13] Uncooked full-cream cheese was used in these experiments. Another series recently begun by the Office of Experiment Stations with cooked cheese, though not yet sufficiently advanced to be conclusive, indicates that cheese thus eaten does not differ materially from raw cheese in this respect.

In connection with the use of cooked cheese in the diet, one fact should always be kept in mind. This is that, in common with all other fatty foods, cheese which has been overheated in cooking is likely to contain burned—that is, decomposed—fats. Disturbances from this cause, however, should be laid to poor cooking and not to the composition of this special food.

The use of potassium bicarbonate has often been recommended for increasing the digestibility of cheese, the amount suggested being a level teaspoonful to a pound of cheese. That the bicarbonate renders the cheese soluble in any appreciable degree, as has been claimed, is not apparent from a number of experiments which have been made. It does, however, neutralize some of the free fatty acids of the cheese, thus destroying some of the characteristic flavor. To some people this may be an advantage, but to others it would be counted a disadvantage.

THE USE OF CHEESE IN THE DIET.

It has been the purpose, in preparing this discussion of cheese, to consider ways in which mild-flavored sorts may serve as staple articles of diet, rather than the use of highly flavored varieties as appetizers and as accompaniments of other foods. The use of highly flavored cheese as a condiment is customary and may profitably be extended, since it offers a simple way of adding to the

attractiveness of the diet. The variety of the cheese selected is a matter of choice, some persons preferring such kinds as well-ripened American full-cream cheese or the potted cheeses, and others such sorts as Roquefort, Camembert, and other varieties. From the physiologist's standpoint, cheese used in this way for its flavor should really form a part of a well-balanced meal rather than be added to a meal which already supplies an abundance of nutritive material. In other words, condimental cheeses may better accompany a moderate than a very generous menu.

In considering the use of cheese in quantity as an integral part of the diet there are many possibilities from simple combinations like bread and cheese to elaborate dishes in which cheese is used as a flavor and as a principal constituent.

As has been pointed out, cheese, being rich in both protein and fat, would logically replace such foods as meat, fish, and eggs when taken in quantity, rather than cereal foods characterized by a large amount of starch, or succulent foods, such as vegetables and fruits. In planning menus of which cheese forms a large part the housekeeper should bear these facts in mind.

BILL-OF-FARE MAKING WITH CHEESE AS THE CENTRAL FOOD.

Since meat has so generally been the chief protein food of a meal, and the kind selected usually has determined the choice of vegetables and condiments, it is not strange that very many housekeepers should be inexperienced and consequently unskillful in planning meals in which cheese is substituted for meat when for any reason they may desire to make such a change. In seeking skill they might take a suggestion from the experiments to which reference has been made, and also from a case investigated and reported by the Office of Experiment Stations, of a man who lived for months upon a diet of bread, fruit, and cheese, and who remained in good health and active, and did not weary of the monotony of the diet.

The first two articles of the diet mentioned, namely, the bread and the cheese, could have been taken in such amounts as to constitute what is usually considered a balanced ration, i.e., in such amounts as to supply the right quantity of muscle-forming foods in comparison with the energy value. The bread and cheese taken with the fruit, however, make a ration which is well balanced not only in the older and more widely accepted sense, but also in the more modern sense that it makes an attractive and palatable combination of foods, as well as a balanced ration, and thus favors digestion. The watery and refreshing fruits or succulent vegetables with their large supply of cellulose are a pleasant contrast to the concentrated and fatty cheese.

Housekeepers would probably find that if in planning menus of which a cheese dish is the chief feature they were to take pains to supply also crisp, watery vegetables, water cress, celery, lettuce served with a dressing or with salt alone, or simple fruit salads, and would give preference to refreshing fruits, either fresh or cooked, rather than to what are known as heavy desserts, they would in general be more successful in pleasing those who are served.

There is another point also to be considered in combining cheese with other foods. Whether it is raw or cooked it is likely to be somewhat soft, and so seems to call for the harder kinds of bread—crusty rolls or biscuit, zweiback, toast, pulled bread, rye bread, the harder brown breads, or crackers, and some of the numerous crisp ready-to-eat cereal breakfast foods. Brittle cookies, too, seem more suitable than rich soft cakes or puddings for the dessert in such meals.

A few bills of fare are given below which experience has shown to represent combinations of dishes which are palatable and which, if eaten in usual amounts, will supply protein and energy in proportions which accord with usual dietary standards. Menus such as these are more commonly served at lunch or at supper, but they might equally well be served for dinner, the selection of dishes for any meal being of course chiefly a matter of custom and convenience for those who have any range of choice.

Suggested bills of fare in which cheese dishes are the chief source of protein and fat.

MENU NO. 1.

Macaroni and cheese (p. 26 or p. 27). Raisin bread or date bread. Orange and water-cress salad. Baked apples. Sugar cookies. Cocoa.

MENU NO. 2.

Cheese fondue (p. 24 or p. 25). Toast, zwieback, or thin and crisp baking-powder biscuit. Celery. Potatoes, baked, boiled, or fried in deep fat. Peas, or some other fresh vegetables. Coffee. Fruit salad with crisp cookies or meringues.

MENU NO. 3.

Clear soup. Baked eggs with cheese (p. 29) or Boston roast (p. 28). Baked potatoes. Lettuce salad. A sweet jelly, crab apple or quince for example, or a preserve. Rye bread. Orange or banana shortcake. Tea.

These bills of fare should be taken as suggestive merely and not as a solution of the problem. In fact, the whole art of making bills of fare needs developing. There is abundant evidence that overeating, where it exists, is frequently due to the fact that meals are not skillfully planned. People often continue eating after they have taken enough in total bulk because they have not had all they want of some particular kind of food. The meal has contained too large a percentage of proteid or too much starch; has been too moist or too dry; too highly flavored or not sufficiently flavored. Bill-of-fare making calls not only for knowledge of food values but also for skill in combining flavors and textures.

In this discussion of menu making, and of the use of cheese as an integral part of the diet, the aim has been to suggest ways of using cheese to add to the palatability of meals made up of usual dishes, and to suggest dishes containing cheese which could serve as substitutes for meat dishes when so desired, and also for dishes of many sorts to be used as taste suggests and in which the nutritive value as well as the flavor is increased by the addition of cheese. If cheese is used and in quantity, it is obvious that some other proteid and fat foods should be diminished, in order that the meal or day's menu may not be unduly hearty.

For the convenience of the housekeeper, a number of recipes for cheese dishes are given in later pages, these being preceded by directions for making cottage cheese and other similar cheeses which are usually made in the home.

HOMEMADE CHEESE.

Even as late as a generation or two ago cheese of different kinds was made at home for family use, as sour-milk or cottage cheese still is, and cheese making was very generally a farm industry, cheese, like butter, being sold by the farmer who made it. Cottage cheese is very commonly homemade. Most types of cheese, however, are now as a rule made on a large scale in factories where advantage may be taken of labor-saving devices. The general topic of farm cheese making has been considered in an earlier bulletin of this series,[14] prepared by the Dairy Division of the Bureau of Animal Industry.

Curds and Whey.

Cheese curds and whey, an old-fashioned dish, which is often spoken of in accounts of life in earlier times, sometimes refers to sour-milk curd and sometimes to curd separated with rennet. This dish when made with rennet is much like junket and though far less common to-day than was once the case is wholesome and palatable.

Cottage Cheese.

This cheese is very commonly prepared in the home, and the process of making it is very simple. It consists merely of curdling the milk, separating the curd from the whey, seasoning, and pressing it.

The curd is formed by the souring of the milk, and the process is hastened if the milk is kept warm, the best temperature being about blood heat, 96° F. A temperature much above this should be avoided, as the curd is likely to become hard and tough if much heated. The danger is usually not that the whole will be overheated but that the portion nearest the fire will be. In the old-fashioned kitchen there was usually a place where the milk could stand till it was uniformly warm throughout. With our present cooking arrangements it is often desirable to hasten the process. This may be done by setting the milk into a pan of warm water or by pouring hot water directly into the milk itself. The effect of the latter method is to remove much more of the acid than when the whey is left undiluted. Some consider this a great advantage.

If, for any reason, the curd is overheated, it should be put through a meat chopper. This will insure cottage cheese of excellent texture.

If the milk is thoroughly chilled before the whey is drained off it retains more of the fat than if this is done when warm. Under no circumstances, however, is much of the fat retained in cottage cheese. It is therefore more economical to make it out of skim milk and to add the fat to the curd in the form of butter or cream.

Chopped parsley, caraway seeds, chopped olives, and pimiento may all be used for flavoring if such flavored cheese is preferred to plain cottage cheese.

Cottage cheese[15] is most commonly consumed immediately, but if made in quantity for commercial purposes, it may be packed in tubs and placed in cold storage. Sometimes it is formed into rolls or blocks and wrapped in tinfoil when marketed. Such cheese is used without ripening.

Though cottage cheese is usually made by allowing the milk to sour naturally, it is sometimes more convenient to curdle the milk by adding rennet, and some housekeepers have a preference for cottage cheese thus made, since the flavor is milder and the acid taste which it possesses when made from sour milk is lacking.

Sour-Cream Cheese.

When cream is to be made into cheese similar to cottage cheese, it should be drained without having previously been heated. The drainage is facilitated by moistening the cloth in salt water before the cream is poured in. The curd is formed either by souring or by the addition of rennet.

Uncooked Curd, or French Cottage Cheese.

The French make cheese from sour milk without heating it. They pour the milk into earthen molds which have holes in the bottom. A very fine sieve may be used instead of the molds. The whey drips out and the curd assumes a custard-like consistency and takes the shape of the mold. When sufficiently stiff, the cheese is chilled, and is eaten with sweet cream and sugar. It is a staple dessert in many French families, especially in hot weather, and is delicious served with acid fruit, such as currants, or with strawberries.

Junket.

If cottage cheese is made from sweet milk and rennet and served without breaking and separating the curd and whey, the dish is called junket. It is customary to season it a little, as with grated nutmeg or with cinnamon and sugar.

Buttermilk Cheese.

At the Wisconsin Experiment Station[16] a method has been devised for making a soft moist cheese out of buttermilk. When made on a large scale, as it might be in creameries, there are various precautions to be taken which are pointed out in the publication cited. In making it in small quantities, these precautions are unnecessary, and the method is even simpler than that of making cottage cheese, because the quality does not depend so much on the temperature.

To make the buttermilk cheese, heat buttermilk gradually to about 130° or 140° F. Allow it to cool and strain it. As the curd will settle to the bottom, most of the whey may be poured off before the draining is begun.

This cheese is, of course, almost wholly without fat and yet, probably because the particles of curd are very finely divided, it has a smooth consistency, which suggests the presence of fat. It may be served seasoned with salt only or it may be mixed with butter or cream and seasonings. It is suitable for combining with olives and pimientos, as recommended on page 34, or for any use to which the ordinary cream cheeses are put.

Buttermilk Cream.

This product also was devised by the Wisconsin Experiment Station.[17] By controlling the temperature in heating the buttermilk and not allowing it to go above 100° F., a compound is made which after draining has the consistency of a very thick cream. It is claimed by the station investigators that this “cream” is suitable for eating on bread in place of butter.

The recipes on pages 34 and 35 suggest ways of making a salad dressing out of buttermilk cream.

Devonshire Cream.

Devonshire cream somewhat resembles sweet cream in flavor and consistency. It is very much liked in England, where it is commonly eaten with fresh or preserved fruit, but is not so well known in America.

To make Devonshire cream, allow a pan of whole milk to stand for 24 hours in a cool place or for 12 hours in a warmer place. Place the pan on the cooler part of the stove and heat until the milk is very hot, but not to the boiling point. If heated too much a thick skin will form on the surface. The more slowly the milk is heated the better. Having been heated, the milk should be kept in a cool place for 24 hours and then skimmed. The thick cream obtained has a characteristic flavor and texture.

[17] Loc. cit.

CHEESE DISHES AND THEIR PREPARATION.

The list of cheese dishes in the culinary literature of this and other countries is a long one, but most of them are variations of a comparatively small number of general types. Those which have been selected and studied experimentally represent the principal types and in many cases have been adapted to American methods of preparations and tastes. In some instances, this has resulted in new and perhaps more rational combinations than those which served as models.

For convenience, the cheese dishes included in this bulletin have been grouped under the following heads:

(1) Cheese dishes which may serve as meat substitutes. (2) Cheese soups and vegetables cooked with cheese. (3) Cheese salads, sandwiches, and similar dishes. (4) Cheese pastry, cheese sweets, and similar dishes.

Variety may be obtained in the recipes by varying the flavorings. Among the best flavorings for cheese dishes are onion, chives, and the ordinary green sweet pepper. Since the cheese needs very little cooking, however, and onion or the pepper needs a great deal, they should always be previously cooked, either by stewing in a very little water, or by cooking in butter. The seeds of the pepper, of course, should be removed before cooking. Where chopped celery is used, as it may be in most of these dishes, it, too, should be cooked beforehand until tender. Other good flavors are mustard, curry powder, onion juice, chopped olives, pimiento, and, according to European recipes, nutmeg or mace.

In preparing the cheese it often has been found convenient to use a very coarse grater having slits instead of the usual rounded holes. Such a grater, in spite of its name, shaves the cheese instead of grating it. When the cheese is soft this is an advantage, since the grater does not become clogged.

CHEESE DISHES WHICH MAY BE USED IN THE SAME WAY AS MEAT.

Meat is wholesome and relished by most persons, yet it is not essential to a well-balanced meal and there are many housekeepers who for one reason or another are interested in lessening the amount of meat which they provide or to substitute some other foods for it. The problem with the average family is undoubtedly more often the occasional substitution of other palatable dishes for the sake of variety, for reasons of economy, or for some other reason than the general replacement of meat dishes by other things.

Foods which are to be served in place of meat should be rich in protein and fat and should also be savory. Cheese naturally suggests itself as a substitute for meat, since it is rich in the same kinds of nutrients which meat supplies, is a staple food with which everyone is familiar, and is one which can be used in a great variety of ways. In substituting cheese for meat, especial pains should be taken to serve dishes which are relished by the members of the family. A number of recipes for dishes which contain cheese are given below. They are preceded by several recipes for cheese sauces which, as will appear, are called for in the preparation of some of the more substantial dishes.

Cheese Sauce No. 1.

1 cupful of milk. 2 tablespoonfuls of flour. 1 ounce of cheese (¼ cupful of grated cheese). Salt and pepper.

Thicken the milk with the flour and just before serving add the cheese, stirring until it is melted.

This sauce is suitable to use in preparing creamed eggs, or to pour over toast, making a dish corresponding to ordinary milk toast, except for the presence of cheese. It may be seasoned with a little curry powder and poured over hard-boiled eggs.

Cheese Sauce No. 2.

Same as cheese sauce No. 1, except that the cheese is increased from 1 to 2 ounces.

This sauce is suitable for using with macaroni or rice, or for baking with crackers soaked in milk. (See p. 27.)

Cheese Sauce No. 3.

Same as cheese sauce No. 1, except that two cupfuls of grated cheese or 8 ounces are used. This may be used upon toast as a substitute for Welsh rabbit.

Cheese Sauce No. 4.

Same as cheese sauce No. 2, save that 2 tablespoonfuls of melted butter are mixed with the flour before the latter is put into the milk. This sauce is therefore very rich in fat and has only a mild flavor of cheese.

Among the recipes for dishes which may be used like meat, the first 30 are such that, eaten in usual quantities, they will provide much the same kind and amount of nutritive material as the ordinary servings of meat dishes used at dinner. In several cases there is a resemblance in appearance and flavor to common meat dishes, which would doubtless be a point in their favor with many families.

While, chiefly owing to custom, it may not accord with the taste of the family to serve cheese dishes at dinner in place of meat, it is much more in accord with usual dietary habits in American homes to serve such dishes at least occasionally for lunch, for supper, or for breakfast; that is, for a less formal meal than dinner. The last group of recipes in this section, beginning with “breakfast cereals with cheese,” supply rather smaller proportions of nutritive materials than those in the first group and so may be more suitable for use at the less hearty meals. There is no hard and fast line to be drawn between the two groups, however, and many of the recipes may be used interchangeably.

In the recipes calling for large amounts of cheese the food value is given, not in figures, but in comparison with beef of average composition and average percentage of waste. This comparison is necessarily rough owing to the varying composition of the foods and the varying weights of such ingredients as a cupful of grated cheese or bread crumbs. In making the comparisons, beef of average composition has been considered to have 15.2 per cent of protein, and a fuel value of 935 calories per pound; ordinary American cheese has been considered to have 26 per cent of protein and a fuel value of 1,965 calories per pound. After many weighings, 4 ounces was decided to be the average weight of a cupful of cheese and 2½ ounces the average weight of a cupful of bread crumbs. These weights have been taken, therefore, in calculating the food value of dishes. When cheese is very soft, however, it may be pressed into a cup and measured like butter. Under these circumstances, the weight of a cupful of cheese may be considered one-half a pound. The price of cheese is taken as 22 cents a pound, of butter 25 cents a pound, of eggs 25 cents a dozen, in this and all similar calculations in this bulletin. Prices vary with time, place, and season. Those mentioned above are such as were paid for materials at the time the experiments here summarized were made and are not extreme values in either direction. Like all such estimates, the calculations are only relative, and the housekeeper who wishes to estimate the comparative cost of the cheese dishes and other foods can readily do so by taking into account the amount of materials used and the prices paid for ingredients at any particular time.

Cheese Fondue No. 1.

1■ cupfuls of soft, stale bread crumbs. 6 ounces of cheese (1½ cupfuls of grated cheese or 1■ cupfuls of cheese grated fine or cut into small pieces.) 4 eggs. 1 cupful of hot water. ½ teaspoonful of salt.

Mix the water, bread crumbs, salt, and cheese; add the yolks thoroughly beaten; into this mixture cut and fold the whites of eggs beaten until stiff. Pour into a buttered baking dish and cook 30 minutes in a moderate oven. Serve at once.

The food value of this dish, made with the above quantities, is almost exactly the same as that of a pound of beef of average composition and a pound of potatoes combined. It contains about 80 grams of proteids and has a fuel value of about 1,300 calories. Estimated cost, 18 cents, calculated as explained on p. 23.

Cheese Fondue No. 2.

1■ cupfuls of hot milk. 1■ cupfuls of soft, stale bread crumbs. 1 tablespoonful of butter. 4 eggs. ■ of a pound of cheese (1■ cupfuls of grated cheese or 1 cupful of cheese cut into small pieces). ½ teaspoonful of salt.

Prepare as in previous recipe.

The protein value of this dish is equal to that of 1■ pounds of potato and beef, the fuel value, however, being much in excess of these. Calculated cost (see p. 23), 22 cents.

In making either of these fondues, rice or other cereals may be substituted for bread crumbs. One-fourth cupful of rice measured before cooking, or one cupful of cooked rice or other cereals, should be used.

A comparison of the recipes for the two fondues may indicate the general principle on which the recipes in this bulletin have been worked out. The second recipe is one commonly found in cookbooks. In the first one, the butter has been omitted and water substituted for milk and the amount of cheese is slightly increased. This makes a somewhat cheaper dish and one which is less rich because its percentage of fat is not so great. For this reason it is easier to adjust to the ordinary bill of fare. A dish in which there is combined cheese with its large percentage of fat, butter with its 85 per cent of fat, and eggs with their 10 per cent of fat, is too rich to admit of being combined rationally with other fatty dishes. It therefore limits the number of dishes that may be served with it, making milk soup, for example, or dishes containing white sauce or those containing much butter or oil seem out of place. The omission of butter from the ordinary recipes and the substitution of water or skimmed milk for whole milk may perhaps be the means of making cheese dishes more wholesome and more generally acceptable.

Another advantage of omitting butter from cheese dishes and of substituting water or skimmed milk for whole milk is that it makes it possible to increase the amount of cheese without making the dish too rich. This is of advantage to those who like the flavor of cheese, and also, because it tends to increase the tissue-forming value of the dish, particularly if skimmed milk is used rather than water.

Boiled Fondue.

1½ cupfuls of bread crumbs. 1½ cupfuls of milk. 1½ cupfuls of cheese cut into small pieces. 1 egg. 2 tablespoonfuls of butter. 6 ounces of crackers.

Soak the bread in the milk. Melt the butter and add the cheese. When the cheese has melted add the soaked crumbs, the eggs slightly beaten, and the seasoning. Cook a short time and serve on toasted crackers.

Since it consists of essentially the same ingredients, the food value of this dish is obviously much the same as that of fondue made in other ways.

Rice Fondue.

1 cupful of boiled rice. 2 tablespoonfuls of milk. 4 eggs. 1 cupful of grated cheese. ½ teaspoonful of salt. 1 teaspoonful of some commercial meat sauce, or similar flavoring.

Heat the rice in the milk, add the other ingredients, and cook slowly until the cheese is melted. Serve on crackers or toast.

The food value is not far from that of a pound of beef of average composition, and the calculated cost (see p. 23) is 15 cents.

Corn and Cheese Soufflé.

1 tablespoonful of butter. 1 tablespoonful of chopped green pepper. ¼ cupful of flour. 2 cupfuls of milk. 1 cupful of chopped corn. 1 cupful of grated cheese. 3 eggs. ½ teaspoonful of salt.

Melt the butter and cook the pepper thoroughly in it. Make a sauce out of the flour, milk, and cheese (see p. 23); add the corn, cheese, yolks, and seasoning; cut and fold in the whites beaten stiffly; turn into a buttered baking dish and bake in a moderate oven 30 minutes.

Made with skimmed milk and without butter, this dish has a food value slightly in excess of a pound of beef and a pound of potatoes. Calculated cost (see p. 23), about 20 cents.

Welsh Rabbit.

1 tablespoonful of butter. 1 teaspoonful of cornstarch. ½ cupful of milk. ½ pound of cheese, cut into small pieces. ¼ teaspoonful each of salt and mustard. A speck of cayenne pepper.

Cook the cornstarch in the butter; then add the milk gradually and cook two minutes; add the cheese and stir until it is melted. Season and serve on crackers or bread toasted on one side, the rabbit being poured over the untoasted side. Food value is that of about three-fourths of a pound of beef. Calculated cost (see p. 23), 13 cents.

Tomato Rabbit.

2 tablespoonfuls of butter. 2 tablespoonfuls of flour. ¾ cupful of milk. ¾ cupful of stewed and strained tomatoes. ■ teaspoonful of soda. 1 pound of cheese. 2 eggs, slightly beaten. Salt, mustard, cayenne pepper.

Cook the butter and the flour together, add the milk, and as soon as the mixture thickens add tomatoes and soda. Then add cheese, eggs, and seasoning. Serve on toasted whole wheat or Graham bread.

Green Corn, Tomato, and Cheese.

1 tablespoonful of butter. 2 cups of grated cheese. ¾ cup of canned or grated fresh corn. 1 ripe pimiento. ½ cup of tomato purée. 2 egg yolks. 1 teaspoonful of salt. ½ teaspoonful of paprika. 1 clove of garlic. 4 slices of bread.

Into the melted butter stir the cheese until it, too, is melted. Then add the corn and pimiento, stir for a moment and add the egg yolks beaten and mixed with the tomato juice and the salt and paprika. Have ready the bread toasted on one side and very lightly rubbed on its untoasted side with the garlic cut in two. Pour the mixture over the untoasted side of the bread and serve at once. A poached egg is sometimes placed on top of each portion, making a very nutritious combination.

Macaroni and Cheese No. 1.

1 cupful of macaroni, broken into small pieces. 2 quarts of boiling salted water. 1 cupful of milk. 2 tablespoonfuls of flour. ¼ to ½ pound of cheese. ½ teaspoonful of salt. Speck of cayenne pepper.

Cook the macaroni in the boiling salted water, drain in a strainer, and pour cold water over it to prevent the pieces from adhering to each other. Make a sauce out of the flour, milk, and cheese. (See p. 23.) Put the sauce and macaroni in alternate layers in a buttered baking dish, cover with buttered crumbs, and heat in oven until crumbs are brown.

Macaroni and Cheese No. 2.

A good way to prepare macaroni and cheese is to make a rich cheese sauce and heat the macaroni in it. (See p. 23.) The mixture is usually covered with buttered crumbs and browned in the oven. The advantage of this way of preparing the dish, however, is that it is unnecessary to have a hot oven, as the sauce and macaroni may be reheated on the top of the stove.

Macaroni with Cheese and Tomato Sauce.

Boiled macaroni may be heated in tomato sauce and sprinkled with grated cheese just before serving.

Italian Macaroni and Cheese.

1 cupful of macaroni broken into small pieces. 2 quarts of boiling salted water. ½ onion. 2 cloves. 1½ cupfuls of tomato sauce. ½ cupful or more of grated cheese.

Cook the macaroni in the boiling salted water with the onion and cloves. Drain, remove the onion and cloves, reheat in tomato sauce, and serve with grated cheese.

Cheese and Macaroni Loaf.

½ cupful of macaroni broken into small pieces. 1 cupful of milk. 1 cupful of soft bread crumbs. 1 tablespoonful of butter. 1 tablespoonful of chopped green pepper. 1 teaspoonful each of chopped onion and parsley. 3 eggs. 1 teaspoonful of salt. ½ cupful of grated cheese.

Cook the macaroni in boiling salted water until tender, and rinse in cold water. Cook the parsley, onion, and pepper in a little water with the butter. Pour off the water or allow it to boil away. Beat the egg white and yolk separately. Mix all the ingredients, cutting and folding in the stiffly beaten whites at the last. Line a quart baking dish with buttered paper; turn the mixture into it; set the baking dish in a pan of hot water, and bake in a moderate oven from one-half to three-fourths of an hour. Serve with tomato sauce.

Baked Rice and Cheese No. 1.

1 cupful of uncooked rice and 4 cupfuls of milk; or, 3 cupfuls of cooked rice and 1 cupful of milk.

2 tablespoonfuls of flour. ½ pound of cheese. ½ teaspoonful of salt.

If uncooked rice is used, it should be cooked in 3 cupfuls of milk. Make a sauce with one cupful of milk, add the flour, cheese, and salt. (See p. 23.) Into a buttered baking dish put alternate layers of the cooked rice and the sauce. Cover with buttered crumbs and bake until the crumbs are brown. The proteids in this dish, made with rice cooked in milk, are equal to those of nearly 1¾ pounds of average beef. If skimmed milk is used, the fuel value is equal to nearly 3½ pounds of beef. Whole milk raises the fuel value still higher. Estimated cost (see p. 23), 28 cents.

Baked Rice and Cheese No. 2.

¼ pound of cheese grated or cut into small pieces. 1 cupful of rice. Milk as needed.

Cook the rice; put into a buttered baking dish alternate layers of rice and cheese; pour over them enough milk to come halfway to the top of the rice; cover with buttered crumbs and brown.

If the rice is cooked in milk either whole or skimmed, and one cup of milk is used to pour over it, this dish has as much protein as 1¼ pounds of beef of average composition, and a much higher fuel value.

Baked Crackers and Cheese No. 1.

9 or 10 butter crackers or Boston crackers. ¼ pound of cheese or 1 cupful of grated cheese. 1½ cupfuls of milk. ¼ teaspoonful of salt. Flour.

Split the crackers, if the thick sort are selected, or with a sharp knife cut them into pieces of uniform size. Pour the milk over them and drain it off at once. With the milk, flour, cheese, and salt, make a sauce. (See p. 23.) Into a buttered baking dish put alternate layers of the soaked crackers and sauce. Cover with bread crumbs and brown in the oven, or simply reheat without covering with crumbs.

The above is a very satisfactory substitute for macaroni and cheese, and can be prepared in less time.

Baked Crackers and Cheese No. 2.

9 or 10 butter crackers or soda crackers. 2 cupfuls of hot milk, whole or skimmed. 1 cupful of grated cheese. ¼ teaspoonful of salt.

This is more quickly prepared than the preceding recipe, but as the milk is likely to curdle, it has not so good a consistency.

Soak the crackers in the milk; place them in a buttered baking dish in alternate layers with the cheese; pour the remaining milk over them and bake. This dish may be covered with buttered crumbs. Variety may be secured, in either this recipe or the preceding one, by putting a very small amount of mixed mustard on each cracker.

Cheese Rolls.

A large variety of rolls may be made by combining legumes, either beans of various kinds, cowpeas, lentils, or peas, with cheese of various kinds, and adding bread crumbs to make the mixture thick enough to form into a roll. Beans are usually mashed, but peas or small Lima beans may be combined whole with bread crumbs and grated cheese, and enough of the liquor in which the vegetables have been cooked may be added to get the right consistency. Or, instead of beans or peas, chopped spinach, beet tops, or head lettuce may be used. Homemade cottage cheese, and the soft cream cheese of commerce, standard cheese, or English dairy may be used.

Boston Roast.

1 pound can of kidney beans or equivalent quantity of cooked beans. ½ pound of grated cheese. Bread crumbs. Salt.

Mash the beans or put them through a meat grinder. Add the cheese and sufficient bread crumbs to make the mixture stiff enough to be formed into a roll. Bake in a moderate oven, basting occasionally with butter and water. Serve with tomato sauce. This dish may be flavored with onions, chopped and cooked in butter and water.

Pimiento and Cheese Roast.

2 cupfuls of cooked Lima beans. ¼ pound of cream cheese, commercial or homemade. 3 canned pimientos chopped. Bread crumbs.

Put the first three ingredients through a meat chopper. Mix thoroughly and add bread crumbs until it is stiff enough to form into a roll. Brown in the oven, basting occasionally with butter and water.

Nut and Cheese Roast.

1 cupful of grated cheese. 1 cupful of chopped English walnuts. 1 cupful of bread crumbs. 2 tablespoonfuls of chopped onion. 1 tablespoonful of butter. Juice of half a lemon. Salt and pepper.

Cook the onion in the butter and a little water until it is tender. Mix the other ingredients and moisten with water, using the water in which the onion has been cooked. Pour into a shallow baking dish and brown in the oven.

Cheese and Spinach Roll.

2 quarts of spinach. 1 cupful of grated cheese. 1 tablespoonful of butter. Salt. Bread crumbs.

Cook the spinach in water for 10 minutes. Drain off the water, add the butter, cook until tender, and chop. Add the grated cheese and then bread crumbs enough to make a mixture sufficiently stiff to form into a roll, or leave more moist and cook in a baking dish.

Vegetable and Cheese Rolls.

For the spinach of the above recipe there may be substituted beet tops, Swiss chard, or the outer leaves of lettuce.

Cheese Used in the Stuffing of Meat.

The mixtures in the preceding two recipes may be used for stuffing veal or beef. Eggs may be added if desired, and chopped onions or parsley may be cooked with the greens. In Italy roasts thus prepared are sprinkled with a little finely chopped garlic, and covered with celery tops and thin slices of bacon or fat pork before roasting.

Creamed Cheese and Eggs.

3 hard-boiled eggs. 1 tablespoonful of flour. 1 cupful of milk. ½ teaspoonful of salt. Speck of cayenne. ¼ cupful or 1 ounce grated cheese. 4 slices of toast.

Make a thin white sauce with the flour and milk and seasonings. Add the cheese and stir until melted. Chop the whites and add them to the sauce. Pour the sauce over the toast, force the yolks through a potato ricer or strainer, sprinkle over the toast.

Baked Eggs with Cheese.

4 eggs. 1 cupful, or 4 ounces, of grated cheese. 1 cupful of fine, soft, stale bread crumbs. ¼ teaspoonful salt. A few grains of Cayenne pepper.

Break the eggs into a buttered baking dish or into ramekins and cook them in a hot oven until they begin to turn white around the edge. Cover with the mixture of crumbs, cheese, and seasonings. Brown in a very hot oven. In preparing this dish it is essential that the oven be very hot or the egg will be too much cooked by the time the cheese is brown. To avoid this, some cooks cover the eggs with white sauce before adding crumbs.

The food value of the dish is very close to that of a pound of beef of average composition. The estimated cost (see p. 23) is about 14 cents.

For those who are particularly fond of cheese the amount of cheese in this recipe may be very much increased, thus making a much more nourishing dish. Or the amount may be reduced so as to give hardly more than a suggestion of the flavor of cheese.

Scrambled Eggs with Cheese.

½ pound of cheese grated or cut into small pieces. 8 eggs 1 tablespoonful of chopped parsley. A pinch of nutmeg. ½ teaspoonful of salt.

Beat the eggs slightly, mix them with the other ingredients, and cook over a very slow fire, stirring constantly, so that the cheese may be melted by the time the eggs are cooked. In food value the dish is equal to nearly 2 pounds of average beef. The calculated cost (see p. 23) is about 30 cents.

Swiss Eggs.

4 eggs. ½ cupful of cream. 1 tablespoonful of butter. Salt and pepper. ¼ cupful of grated cheese.

Heat the butter and cream together, break in the eggs whole, sprinkle with salt and pepper. When nearly done, add the cheese. Serve on buttered toast. Strain the cream over the toast.

Cheese Omelet No. 1.

Cheese may be introduced into omelets in several ways. An ordinary omelet may be served with thin cheese sauce made in the following proportions:

1½ tablespoonfuls of flour. ¼ cupful of grated cheese. 1 cupful of milk.

This sauce may also be added to omelets in which boiled rice, minced meat, or some other nutritious material has been included.

Cheese Omelet No. 2.

Grated cheese may be sprinkled over an ordinary omelet before it is served.

Cheese Omelet No. 3.

Yolks of 2 eggs. 2 tablespoonfuls of hot water. 1 cupful of grated cheese. Salt and pepper. Whites of 4 eggs. 1 tablespoonful of butter.

Beat the yolks until lemon colored and add the hot water and the seasoning. Beat the whites until they are stiff, and add the cheese. Cut and fold the two mixtures together. Heat the butter in omelet pan and cook the mixture very slowly until it is brown on the underside. If possible, cook the top of the omelet in the oven or by means of a hot plate held over it.

Breakfast Cereals with Cheese.

That cheese combined with cereal foods makes a rational dish as regards the proportion of nutrients it supplies has been pointed out on another page (p. 18). Cheese and some of the crisp “ready to serve” cereal breakfast foods is a combination which is common, the cheese being melted with the cereal food, or simply served with it.

There are many who relish a piece of cheese with the cooked cereal so commonly eaten for breakfast and find such a combination satisfying to appetite and taste. Oatmeal or some other home-cooked breakfast cereal prepared with cheese is palatable, and such dishes have an advantage in that they may be served without cream and sugar. Since such a dish contains considerably more protein than the breakfast cereals as ordinarily served, it has a further advantage in that it may well serve as the principal item of a breakfast menu, instead of a preliminary to other courses. Such a combination as cereals cooked with cheese, toast, fruit, and tea, coffee, or chocolate, makes a palatable as well as nutritious breakfast and one which does not require much work to prepare and to clear away. A recipe for preparing oatmeal with cheese follows. Wheat breakfast foods, either parched or unparched, corn meal, and hominy may be prepared in the same way.

Oatmeal with Cheese.

2 cupfuls of oatmeal. 1 cupful of grated cheese. 1 tablespoonful of butter. 1 level teaspoonful of salt.

Cook the oatmeal as usual. Shortly before serving, stir in the butter and add the cheese, and stir until the cheese is melted and thoroughly blended with the cereal.

The cheese should be mild in flavor and soft in texture. The proportion of cheese used may be increased if a more pronounced cheese flavor is desired.

Cheese with Mush.

Cheese may be added to corn-meal mush or to mush made from any of the corn or wheat preparations now on the market. The addition of cheese to corn-meal mush is particularly desirable when the mush is to be fried.

Fried Bread with Cheese No. 1.

6 slices of bread. 1 cupful of milk. 2 ounces of cheese, or ½ cupful of grated cheese. ½ teaspoonful of salt. ½ teaspoonful of potassium bicarbonate. Butter or other fat for frying.

Scald the milk with the potassium bicarbonate; add the grated cheese, and stir until it dissolves. Dip the bread in this mixture and fry it in the butter. The potassium bicarbonate helps to keep the cheese in solution. It is desirable, however, to keep the milk hot while the bread is being dipped.

Fried Bread with Cheese No. 2.

Cut stale bread into thin pieces. Put two pieces together with grated cheese between them; dip into a mixture of egg and milk and fry in butter or other fat.

Roman Gnocchi.

¼ cupful of butter. ¼ cupful of flour. ¼ cupful of cornstarch. 2 cupfuls of milk. 2 egg yolks. ¾ cupful of grated cheese. Salt.

Melt the butter; cook the cornstarch thoroughly, and then the flour in the butter; add the milk gradually; cook three minutes, stirring constantly; add the yolks and one-half cupful of the cheese. Pour into a buttered shallow pan and cool. Cut into squares; place them on a platter a little distance apart; sprinkle with remaining cheese, and brown in the oven.

The proteid value is that of three-fourths of a pound of average beef, the fuel value that of 1¾ pounds. Calculated cost (see p. 23), 17 cents.

Cheese Soufflé.

2 tablespoonfuls of butter. 3 tablespoonfuls of flour. ½ cupful of milk (scalded). ½ teaspoonful of salt. A speck of cayenne. ¼ cupful of grated cheese. 3 eggs.

Melt the butter; add the flour and, when well mixed, add gradually the scalded milk. Then add salt, cayenne, and cheese. Remove from the fire and add the yolks of the eggs, beaten until lemon colored. Cool the mixture and fold into it the whites of the eggs, beaten until stiff. Pour into a buttered baking dish and cook 20 minutes in a slow oven. Serve at once.

The proteid of this recipe is equal to that of half a pound of beef; the fuel value is equal to that of three-fourths of a pound.

Cheese Soufflé with Pastry.

2 eggs. ■ cupful of thin cream. 1 cupful of grated cheese. ½ cupful of Swiss cheese cut into small pieces. Salt, cayenne pepper, and nutmeg.

Add the eggs to the cream and beat slightly, then add the cheese and seasoning. Bake 15 minutes in a hot oven, in patty tins lined with puff paste.

Cheese Croquettes.

3 tablespoonfuls of butter. ¼ cupful of flour. ■ cupful of milk. Yolks of 2 eggs. 1 cupful of cheese cut in very small pieces. ½ cupful grated cheese. Salt and pepper.

Make with a white sauce, using the butter, flour, and the milk. Add the unbeaten yolks and stir until well mixed, then add the grated cheese. As soon as the cheese melts, remove from the fire, fold in the pieces of cheese, and add the seasoning. Spread in a shallow pan and cool. Cut into squares or strips, cover with an egg and crumb mixture, and fry in deep fat.

Fried Cheese Balls.

1½ cupfuls of grated cheese. 1 tablespoonful of flour. The whites of 3 eggs. Salt, pepper, cracker dust.

Beat the whites of the eggs; add the other ingredients; make into balls and roll in cracker dust. If the amount of flour is doubled, the mixture may be dropped from a spoon and fried without being rolled in crumbs.

CHEESE SOUPS AND VEGETABLES COOKED WITH CHEESE.

In these dishes the cheese is used not only to add nutritive value, but also to give its characteristic flavor either to materials otherwise rather mild in taste (as in potatoes with cheese) or to combine its flavor with that of some more highly flavored vegetables (as in cheese and vegetable soup). The ingenious housekeeper whose family is fond of cheese can doubtless think of many desirable ways of making such combinations besides those given in the following recipes:

Milk and Cheese Soup.

3 cupfuls of milk, or part milk and part stock. 1½ tablespoonfuls of flour. 1 cupful of grated cheese. Salt and paprika.

Thicken the milk with the flour, cooking thoroughly. This is best done in a double boiler, with frequent stirrings. When ready to serve, add the cheese and the seasoning.

The proteids in this soup are equal in amount to those in five-sixths of a pound of beef of average composition; its fuel value is higher than that of a pound of beef.

Cheese and Vegetable Soup.

2 cupfuls of stock. 2 tablespoonfuls of finely chopped carrots. 1 tablespoonful of chopped onion. A very little mace. 2 tablespoonfuls of butter. 2 tablespoonfuls of flour. 1½ teaspoonfuls of salt. 1 cupful of scalded milk. ¼ cupful of grated cheese.

Cook the vegetables a short time in one-half of the butter, add the stock and the mace, boiling 15 or 20 minutes. Strain and add the milk. Thicken with flour cooked in the remaining butter. Just before serving, stir in the cheese and cook until it is melted.

Scalloped Potatoes with Cheese No. 1.

Put into a buttered baking dish alternate layers of cheese sauce No. 1 (see p. 22) and cold boiled potatoes, sliced or cut into dice. Cover with buttered crumbs and bake.

Scalloped Potatoes with Cheese No. 2.

Put into a buttered baking dish alternate layers of white sauce and cold boiled potatoes, either sliced or cut into dice. Put over the top a layer of grated cheese and then a layer of buttered bread crumbs. Brown in the oven.

Scalloped Cabbage or Cauliflower with Cheese.

Cauliflower or cabbage may be scalloped according to either of the recipes given for scalloped potatoes and cheese. Sometimes a cauliflower is boiled whole, spread with grated cheese, then with buttered bread crumbs. It is browned in the oven and served with white sauce poured around it.

Cheese with Potato Puffs.

1 cupful of mashed potatoes. ¼ cupful of milk. 1 egg. ½ teaspoonful of salt. ½ cupful of grated cheese.

Beat the potatoes and milk together until thoroughly mixed. Add the egg and the salt and beat thoroughly. Finally add the cheese. Bake in muffin tins in a slow oven 10 or 15 minutes.

A similar dish may be made by scooping out the inside of a baked potato and mixing it with cheese as above. Fill the potato-skin shell with the mixture, return to the oven, and bake until light brown.

Potatoes with Cheese Sauce.

Cut boiled potatoes into cubes and serve with cheese sauce No. 1. (See p. 22.) This is one of the cheese and vegetable dishes most frequently found on restaurant menus.

CHEESE SALADS, SANDWICHES, AND SIMILAR CHEESE DISHES.

Cheese of one sort or another is a very common accompaniment of salads, and the combination is rational as well as palatable, for the constituents of the succulent foods—chiefly water and cellulose—supplement the protein and fat of the cheese. Cheese is often used also as a part of the salad.

A number of recipes are given below for cheese salads and other cheese dishes which may be served with dinner or other regular meals, or served as part of a special lunch or special supper. Many of the cheese dishes discussed in other sections are also commonly used for such occasions when something savory is desired which can be easily and quickly prepared.

Cheese with Salads.

Cheese or cheese dishes are an acceptable addition to salads. Neufchâtel or other cream cheese, either plain or mixed with pimientos and olives, may be passed with lettuce or may be cut into slices and served on lettuce.

Cheese balls are often served with salad. They are made of some soft cream cheese, and are frequently combined with chopped chives, olives, sweet peppers, chopped nuts, etc., for the sake of adding flavor. Cooked egg yolk, spinach extract, etc., are sometimes mixed in for the sake of color. If the balls are rolled in chopped chives or parsley, both flavor and color are supplied.

Plain Cheese Salad.

Cut Edam or ordinary American cheese into thin pieces, scatter them over lettuce leaves, and serve with French dressing.

Olive and Pimiento Sandwich or Salad Cheese.

Mash any of the soft cream cheeses and add chopped olives and pimientos in equal parts. This mixture requires much salt to make it palatable to most palates, the amount depending chiefly on the quantity of pimiento used. The mixture may be spread between thin slices of bread or it may be made into a roll or molded, cut into slices, and served on lettuce leaves with French dressing.

Cheese and Tomato Salad.

Stuff cold tomatoes with cream cheese and serve on lettuce leaves with French dressing.

Cheese and Pimiento Salad.

Stuff canned pimientos with cream cheese, cut into slices, and serve one or two slices to each person on lettuce leaves with French dressing.

Cheese Jelly Salad.

½ cupful of grated cheese. 1 tablespoonful of gelatin. 1 cupful of whipped cream. Salt and pepper to taste.

Mix the cheese with the whipped cream, season to taste with salt and pepper, and add to the gelatin dissolved in a scant cupful of water. This may be molded in a large mold or in small molds.

When the jelly begins to harden, cover with grated cheese. The jelly should be served on a lettuce leaf, preferably with a cream dressing or a French dressing, to which a little grated cheese has been added.

Cheese Salad and Preserves.

Epicures have devised a dish which consists of lettuce with French dressing served with cream cheese and thick preparations of currants or other fruits preserved in honey or sugar, which, owing to the fact that the seeds have been extracted by a laborious process, are fairly expensive. The soft cheese often found in market is also relatively expensive. There is a suggestion in this dish, however, for others which are much less costly. Buttermilk cream (see p. 21), or ordinary cottage cheese served with lettuce or other green salad and a small amount of rich homemade preserves, is a combination with much the same character, and also very appetizing.

Deviled Eggs with Cheese.

In making deviled eggs, either to be eaten alone or upon lettuce leaves in the form of salad, a little grated cheese may be mixed with the yolks in addition to the usual salad dressing and flavorings with which the yolks are mixed.

Cheese and Celery.

Cut stalks of celery having deep grooves in them into pieces about 2 inches long. Fill the grooves with cream cheese salted or flavored with chopped pimientos, and serve with bread and butter as a salad course or serve as a relish at the beginning of a meal.

Although not cheese dishes, strictly speaking, the following salad dressings made with buttermilk cream (see p. 21) may be included in this section.

Buttermilk Cream Salad Dressing.

½ cupful of buttermilk cream (see p. 21). 1 tablespoonful of vinegar. ¼ teaspoonful of salt. Cayenne pepper.

This dressing is particularly suitable for serving with cucumbers.

Buttermilk Cream Horseradish Salad Dressing.

To buttermilk cream add a little grated horseradish and vinegar and salt. Serve on whole or sliced tomatoes.

Cheese Sandwiches.

Mash or grate American cheese, add salt, a few drops of vinegar and paprika, and a speck of mustard. Mix thoroughly and spread between thin slices of bread.

Cheese and Anchovy Sandwiches.

To the mixture mentioned in the preceding recipe, add a little anchovy essence. Sardines mashed or rubbed into a paste or any other fish paste may be used in a similar way.

Pimiento, Olive, and Cheese Sandwiches.

These sandwiches are referred to on page 34.

Cuban Sandwiches.

This sandwich may be described as a kind of club sandwich with cheese. It is usually made large so that it is necessary to eat it with a knife and fork. It may be made in such proportions as to supply a large amount of nourishment.

Cut the crusts from slices of bread. Between two slices lay first lettuce with a little salad dressing or salt on it, then a slice of soft mild cheese and finally thin slices of dill pickles or a little chopped pickle.

Toasted Cheese Sandwiches.

Plain bread and butter sandwiches with fairly thick slices of cheese put between the slices are frequently toasted, and on picnics, or at chafing-dish suppers, are often browned in a pan in which bacon has just been fried.

CHEESE PASTRY, CHEESE SWEETS, AND SIMILAR DISHES.

In the foregoing pages a large number of recipes have been included in which cheese is combined with materials without cooking, as in salads, or used in cooked dishes of creamy or custard-like consistency, as in soufflés and Welsh rabbit or in combination with vegetables or cereals, such as rice.

There are a number of cheese dishes of quite different character in which the cheese is combined with dough, batter, or pastry in various ways, and a number of dishes in which cheese or cheese curd is used in combinations suitable for dessert. Such sweet dishes were once much more common than they are to-day, as reference to old cookery books will show, but some of them are well worth retaining.

In cheese sweets, flavor and richness are both contributed by the cheese.

When cheese is used in pastry or dough it may serve simply as a flavor, as in cheese sticks or cheese straws, or it may wholly or in part replace with its fat the usual shortening, as butter or other fat, and with its protein (casein) the protein (albumin) of eggs. As an illustration of such a use of cheese, cheese gingerbread may be cited.

Using cheese in this way is often an economy when eggs are scarce. Better results will be obtained if soft cheese is used which can be worked into the dough in much the same way as butter or other shortening. To those who like cheese the flavor which it imparts would be an advantage. However, if a very mild cheese is used in combination with molasses or spice the dish differs a little in flavor from one prepared in the usual way.

CHEESE PASTRIES AND SIMILAR DISHES.

Cheese Biscuit No. 1.

2 cupfuls of flour. 4 teaspoonfuls of baking powder. 2 tablespoonfuls of lard or butter. ■ of a cup of milk. ¼ teaspoonful of salt. Grated cheese sufficient to give desired flavor.

Mix all the ingredients excepting the cheese as for baking powder biscuits. Roll thin, divide into two parts, sprinkle one half with grated cheese, lay the other half of the dough over the cheese, cut out with a small cutter, and bake.

Cheese Biscuit No. 2.

¼ pound of soft cheese. 2 cupfuls of flour. 1 cupful of water. 4 teaspoonfuls of baking powder. 1½ teaspoonfuls of salt.

Mix and sift the dry ingredients, then work in the cheese with a fork or with the fingers, and add the water gradually. The approximate amount of water has been given; it is impossible to give the exact amount, as flour differs in its capacity for taking up moisture. Toss the dough on a floured board and roll out and cut with a biscuit cutter. Place in a buttered pan and bake in a quick oven from 12 to 15 minutes. The biscuit may be sprinkled with cheese before being put into the oven.

If the cheese is sufficiently soft it can be measured just as butter is. This recipe, then, would call for ½ cupful.

Cheese Drops.

2½ tablespoonfuls of milk. 1 teaspoonful of butter. 1¼ cupfuls of flour. ■ teaspoonful of salt. 1 egg. 2 tablespoonfuls of grated Parmesan cheese or dry American cheese.

Heat the butter and milk to boiling point, add the flour and the salt and stir thoroughly. Remove from the fire, add the egg and cheese and stir until well mixed. When cold, drop in small pieces in deep fat and brown. This makes a good addition to any clear soup or to consommé.

Cheese Wafers.

Spread grated cheese on thin crackers, heat in the oven until the cheese is melted. Serve with soup or salad.

Cheese Relish.

Spread bread which has been toasted or fried in deep fat with grated cheese, or with grated cheese mixed with a little mustard, then heat in the oven until the cheese is melted. This may be served with salad, or as a relish to give flavor to some dish such as boiled rice or hominy, which has no very marked flavor.

Cheese Straws.

Roll out plain or puff paste until one-fourth of an inch thick. Spread one-half of it with grated cheese. Fold over the other half and roll out again. Repeat the process three or four times. Cut into strips and bake. Serve with soup or salad.

Salad Biscuit.

½ pound of cheese. 2 cupfuls of flour. 4 teaspoonfuls of baking powder. 1½ teaspoonfuls of salt. 1 cupful of water.

Mix as for cheese biscuits No. 1 or No. 2, depending on whether the cheese is hard or soft. (See p. 36.)

Cheese Gingerbread No. 1.

1 cupful of molasses. 4 ounces of cheese. 1 teaspoonful of soda. ½ cupful of water. 2 cupfuls of flour. 2 teaspoonfuls of ginger. ½ teaspoonful salt.

Heat the molasses and the cheese in a double boiler until the cheese is melted. Add the soda and stir vigorously. Mix and sift dry ingredients and add them to the molasses and cheese alternately with the water. Bake 15 minutes in small buttered tins.

Cheese Gingerbread No. 2.

½ cupful of molasses. ½ cupful of sugar. 4 ounces of cheese. 2 cupfuls of flour. 1 teaspoonful of soda. 2 teaspoonfuls of ginger. ½ teaspoonful of salt. ¾ cupful of water.

Rub the cheese and the sugar together. Add the molasses. Mix and sift the dry ingredients and add them to the cheese mixture alternately with the water.

Cheese Custard.

1 cupful of grated cheese. ½ cupful of cream or rich milk. Yolks of 2 eggs. A speck of salt and of paprika.

Mix the cream and the cheese and heat until the cheese is melted. Remove from the fire and add the yolks of the eggs. Bake in paper cases or buttered ramekins. Serve with jelly or preserves.

Cheese Cakes.

1 quart of milk. Rennet. 1 ounce of sugar. Yolks of 2 eggs. A speck of nutmeg. 1½ ounces of butter. 1 ounce of dried currants or small raisins.

Warm the milk and add the rennet, using the amount prescribed on the package. Let the milk stand until the curd forms, then break up the curd and strain off the whey. Add the other ingredients to the curd; line patty tins with pastry, fill them with the mixture, and bake.

Brown Betty with Cheese.

Arrange in a deep earthenware baking dish, alternate layers of bread crumbs and thinly sliced apples. Season with cinnamon, also a little clove if desired and brown sugar. Scatter some finely shaved mild full-cream cheese over each layer of apple. When the dish is full, scatter bread crumbs over the top and bake 30 to 45 minutes, placing the dish in a pan of water so that the pudding will not burn.

If preferred, this may be sweetened with molasses mixed with an equal amount of hot water and poured over the top, a half cupful of molasses being sufficient for a quart pudding dish full.

Cheese may be used in place of butter in a similar way in other apple puddings. Apple pie made with a layer of finely shaved cheese over the seasoned apple and baked in the usual way is liked by many who are fond of cheese served with apple pie.

CONCLUSION.

In the foregoing pages information has been summarized regarding the food value of cheese, an important agricultural product, and ways of preparing it for the table. It has been pointed out that, judged by the kind of nutrients it supplies—chiefly nitrogenous material and fat—and the proportion in which they are present, it resembles such foodstuffs as meat, fish, and eggs, which means that like them its rational use in the diet is in combination with other staple foods, to form well-balanced meals.

Experiments have shown that when eaten either raw or carefully cooked, cheese is as thoroughly digested as other staple foods and is not likely to produce physiological disturbance.

An ounce of cheese roughly is equivalent to 1 egg, to a glass of milk, or to 2 ounces of meat.

Although uncooked cheese resembles meat in composition, cheese dishes prepared after ordinary recipes, with milk and shortening, are likely to contain more fat than meat dishes prepared in the usual ways. When, therefore, such cheese dishes are served with other staple foods the combination is likely to contain more fat than the usual meal. If little fat is ordinarily used, this may be an advantage. If a great deal of fat is ordinarily used, it may be desirable to lessen the amount in the cheese dishes. This can readily be done by omitting the shortening and using skim milk or water in the preparation of such dishes, a change which also lessens their cost.

The fact that cheese, like meat, contains neither starch nor cellulose suggests that, like meat, it should be combined with bread, potatoes, and other starchy foods, with vegetables and with sweets. The concentrated character of cheese and many cheese dishes suggests the use of succulent fruits and vegetables with them. The high percentage of fat in cheese suggests the use of correspondingly small amounts of fat in the accompanying dishes, while the soft texture of cheese dishes as compared with meat makes it reasonable to serve the harder and crustier breads with them.

When cheese is not used as the chief nitrogenous food of a meal it may be introduced into bills of fare in many incidental ways, and thus add materially to that portion of the diet needed for building and repairing body tissue.

Though cheese is so generally used in some way in most families, yet the making of menus with cheese as a central dish is less well understood than more usual food combinations, since there is less experience to serve as a guide. More thought is therefore usually required to arrange such cheese meals in order that they may be palatable and at the same time reasonable in nutritive value.

In order that the diet may remain well balanced, cheese, if used in quantity, should replace foods of similar composition rather than supplement them. The builder who has a choice of materials must have a knowledge of their relative properties if he wishes to use stone instead of brick, or wood in place of iron. It is the same with the housekeeper who wishes to use her available food supply intelligently and whose choice of foods is influenced by their relative cost at a given time or season. The woman who has a knowledge of the relative food value of different articles of diet, and their real food qualities as distinguished from their market value, who understands good methods of cooking and serving foods, and who plans her meals and other housework so that unnecessary labor and expense may be avoided, is taking account of the things which make for economical living as well as for good living.

Some persons seem to believe that cheese or fish or other food is the ideal food for some particular circumstance and that there is a special food or diet suited to each kind of work and to every circumstance of our daily life, and that it would be a great advantage if we could regulate our daily fare with the accuracy a chemist uses in making an experiment. Work, recreation, the amount of clothing we wear, and other details of our daily life are not so regulated, and it is the belief of those who have studied the subject that the best interests of persons living under normal conditions are served if the ideal be rather the regulation of the diet along general lines in accordance with good sense, the teachings of experience, economy, and the available knowledge gained from a scientific study of the subject, due care being taken that the different staple foodstuffs are so combined that all the needs of the body are provided, excessive waste is prevented, and that both undernourishment and excess or overeating are avoided.

Dishes which are liked and the methods followed in preparing them will vary in different countries and at different times, yet this does not of necessity mean that the nutritive value of the diet varies correspondingly. In the same way it is possible for us to vary the selection of our foods and the character of our diet at will, according to the demands of our taste and our purse, without correspondingly changing its value for supplying the needs of the body. This means that the housekeeper, in suitable ways, can use cheese, meat, fish, eggs, and other foods of similar composition as substitutes for one another, being governed by their relative market value at different times and seasons, by the tastes of her family, and similar considerations. If she uses the different

foodstuffs with reference to their nutritive value and is skillful in preparing foods in appetizing ways and in serving them in attractive combinations, the daily fare may be both adequate and pleasing, whether she selects cheese or meat or fish or eggs or other foods to supply nitrogenous material and fat. Here, as in all that pertains to housekeeping, true economy is dependent upon a knowledge of materials and skill in using them.

Transcriber’s Notes

pg 8 Removed repeated word the from: If cream is removed the the cheese pg 12 Changed brought about chiefly by the action of enzyms to: enzymes pg 15 Changed 90 per cent of the nitrogeous to: nitrogenous pg 20 Changed the curd assumes a custardlike to: custard-like pg 24 Added period after No in: Cheese Fondue No 1. pg 24 Added period after: 1 tablespoonful of butter pg 25 Changed Corn and Cheese Souffle. to: Soufflé. pg 31 Added period after: Salt, cayenne pepper, and nutmeg

To My Father and Mother AN APPRECIATION OF THEIR STEADFAST INTEREST IN MY WORK

PREFACE

The basic soundness of the method of instruction in Accounting developed in this book has received substantial demonstration throughout five years of test. The Introduction to the first edition contained the following statement regarding the development of the subject:

"The method of approach as given in this volume is perhaps not orthodox but it has seemed that the student, given an understanding of the purpose which the accounting records are to serve, will be able to make that record with real intelligence instead of by rule-of-thumb. Accordingly, the balance sheet and the profit and loss statement are presented first, as the goal towards which all record-keeping looks. The student is taught to analyze business facts and conditions from the very beginning. He is then led, step by step, through the use of non-technical terms, into the ledger, where he sees the way in which the data which he has been using are summarized. The books of original entry are next explained, and the method by which the information is classified as it is brought onto the books. Finally, the business papers and documents which constitute the source of all entries are described."

To quote again from the original Introduction: "The subject is developed in such a way that the student knowing something of bookkeeping has little or no advantage over the one without such knowledge. This book has been written for the use of students in our colleges and universities desiring a first course in accounting. It gives the scope of the work in accounting offered in the first year of the School of Business of Columbia University."

The method then advocated and used in a few institutions has become quite generally accepted. It has justified itself by the ease and extent to which students without any previous training in accounting have grasped the essentials of the subject. Experience with the book in the classroom, however, and changing ideas with regard to manner of presentation and sequence of material, have shown as desirable a rearrangement of some parts and an addition of new material in places. Accordingly, a systematic revision has been made.

The arrangement of the subject matter of the first portion of the book has been altered but slightly. The use and function of the balance sheet and profit and loss statement have been somewhat amplified. The working sheet has been introduced earlier than in the first edition to afford an easy summary of the period's results. It should later on be made a part of the regular work of summarization. The controlling account is also explained earlier so as to afford more practice in its use. The accounting features of the partnership and of the corporation are given continuous treatment. Here a new chapter has been added, which discusses certain features of the corporation not treated in the original book such as the issue and sale of treasury stock and of bonds, bond interest as related to premium and discount, sinking fund, sinking fund reserve, redemption of bonds, etc.

The material presented in the last quarter of the book deals with the interrelations of accounting, financial management, buying, and marketing. Thus the chapters dealing with the handling of cash, notes receivable and payable, cash discounts, and balance sheet valuation, treat of the relations between accounting and financial management. Several chapters at the end treat of some special methods of accounting practice and of the basic principles of single entry. In this portion of the book new chapters on balance sheet valuation and on buying have been added.

Entirely new problem material has been furnished, carefully graded and related so far as possible to the subject matter of the chapters of the text. For the convenience of the student this material is separated from the text, and grouped in three appendices. A few of the problems have been drawn from the examinations of various state boards and the regents of the University of the State of New York, and from other miscellaneous sources, to all of which acknowledgment is due. The author is indebted to Mr. George B. Kelley for assistance in building up a large part of the practice material. It need hardly be said that a fundamentally sound knowledge of accounting cannot be gained without ample practice work. Theory can never be sure of itself until put to the test of practice.

The author desires to acknowledge again his debt to the many friends whose counsel and aid counted so largely in the first writing of this book. In the revision he finds himself still further indebted to many instructors in all sections of the country for criticism and suggestion. He desires especially to express his appreciation of the active co-operation of his associates on the Columbia staff of instructors in First Year Accounting, in particular Miss Nina Miller and Messrs. Ralph T. Bickell and E. Gaylord Davis. In the actual work of revision Messrs. Eskholme Wade, John Jaffee, and Raymond Gatchell have given valuable assistance.

ROY B. KESTER Columbia University, New York City, July 22, 1922

Accounting—Theory and Practice

CHAPTER I

BASIC RELATIONSHIPS—PROPRIETORSHIP

=Records and Their Functions.=—As far back as our knowledge reaches, records of some sort have been kept and used and they have frequently formed the basis on which our knowledge rests. In a broad sense a record may be defined as a written memorial, a register or history of events, a testimony. Even though the desire to make and hand on to the future a record of achievement is a deep-seated characteristic, record-making has seldom been an end in itself. Knowledge of what has been done has always been a starting point and a guide for future achievement. The longhand or narrative record is indispensable in some fields of knowledge; the shorthand or statistical record is equally necessary in others. The statistical method and accounting are, without question, most potent agencies for the advancement of human knowledge and for the control of human relationships. They provide the basis in fact on which judgments must largely rest. This book, therefore, may begin by sketching the relation of accounting to some of the larger fields of human endeavor—the economic organization of society and the law—to point out its place in the business unit and briefly state the basic function it performs therein.

=The Business Unit.=—To carry on its various activities, economic society has organized itself into numberless separate units or business organizations. These units are the means through which society operates, their ultimate purpose being the easy and efficient satisfaction of human economic wants. Individual business units, conducted as they are by members of society, are under the broad general supervision of society as a whole. This is evidenced everywhere by the laws, licenses, and regulations by which society attempts to regulate the activities of the individual for the larger interest of society as a whole. As business is conducted in most parts of the world, it is highly individualized rather than communized. There is a growing tendency, however, for society to exercise a larger control and supervision over all types of individual activity, particularly with a view to conserving the welfare of its members. The business unit is thus the medium through which society works to satisfy its economic wants.

=Internal Organization of the Business Unit.=—Society early found that only by means of a highly specialized division of its activities was it possible to satisfy without waste its rapidly increasing economic wants. Individual business units are thus organized for the purpose of carrying on some one or more of these greatly subdivided activities. Within itself the business unit is organized into departments or divisions for the efficient and thrifty handling of its work. The two large divisions in any business undertaking have to do with what the economist calls the production and exchange of wealth, that is, commodities, services, and so forth. In carrying on these activities of production and exchange it has usually been found desirable to segregate into separate departments certain major functions which are common both to production and to exchange. What the major departments may be depends very largely upon the size of the business unit, its relative complexity of organization, and to some extent on the individual ideas of its managers. Throughout the business world one notes, however, a quite general departmentization under the following heads:

1. Finance 2. Procurement or production 3. Marketing or distribution 4. Personnel 5. General administration

There are two main activities under the control of the finance division of a business: (a) the problem of original investment, including that of location and acquisition of a plant suitable for the conduct of a contemplated business; and (b) the problem of operating finance, that is, of providing the business with a fund of working capital for its efficient operation. The financing of purchases, sales, credits, operating expenses, and so forth, comprises a large part of the work of finance of an operating or going concern.

In the second of the major departments, that of procurement or production, one finds these activities: (a) the purchasing of the stock-in-trade to be dealt in, if the concern is a trading business; or (b) the manufacture of the stock-in-trade, if the concern is a manufacturing business.

In the department of marketing or distribution, the following activities center: (a) those having for their purpose the creation of a market or demand for the commodity dealt in—the sales organization, the advertising activities, and so forth; (b) the actual selling of the commodity; and (c) the transportation and delivery of the product.

In the personnel department are included the human relations between employer and employee. The hiring and training of the employee, his classification and rating, his welfare and promotion, are the major activities here.

The function of the department of general administration is in the main that of supervision and management of the business as a whole. The general manager must have a view of all of the activities of the business. He must see that the various departments through which its activities are carried on are properly correlated, that it is so organized that its departments function smoothly and efficiently in the performance of their several duties. A consideration of the means employed by the general manager for the proper performance of his duty indicates the place of accounting in the business unit.

=Place of Accounting in Business.=—In a small business where the owner and manager is in close and intimate contact with these several departments, or perhaps where he focuses all of them within himself, he has no need of special means of keeping himself informed concerning the activities of his assistants, nor does he require an elaborate system of records to indicate the condition and state of the business at any time. In large businesses, however, where the volume and complexity of the commercial activities make it impossible for the executive, on whom rest the responsibilities for the successful conduct of the business, to have an intimate personal knowledge of all phases of the business, it is very necessary that some means be employed for supplying him with this vital information. Two types of information are necessary to him: (1) information about the business unit itself, its activities and condition; and (2) information about general economic conditions in the country, and particularly about other businesses in the same line of activity as his own. It is the function of accounting to supply information of the first type; it is the chief purpose of statistics to supply information of the second type. The accounting department, therefore, deals largely with the internal activities of the business, while the statistical department provides knowledge of the external relations of the business. A proper control and management of business affairs cannot be exercised without the information supplied by both departments. In the accomplishment of its function to supply the internal information, the accounting department reaches out into all of the main departments indicated above for data from which to make its record of the various activities of the business unit.

=Purpose of Accounts.=—Accounts record the business history of a concern. Their main purpose is to secure information concerning the results of business activity and endeavor. The record required for this purpose can be condensed and made very brief, although the full history of every business comprises a multitude of transactions with a great mass of details. The whole scheme and method of account-keeping is designed chiefly to collect the detail and use it mainly for building up a summary which shall give in rapid review the entire record for the fiscal period.

Account-keeping is to the bookkeeper what shorthand is to the stenographer—an abbreviated method of making the record. The uses to which the records are put, however, differ radically. Stenography abbreviates the writing of the spoken word with a view to its transcription into longhand; accounting records business transactions in abbreviated form with a view to summarizing them further so as to secure a bird's-eye view of the operations of the business as a whole and to use it in the formulation of administrative judgments and policies.

In a large business there are executive duties within each of the five main departments. Accounting must supply the information on which each departmental executive will base his judgments and policies. The student will see, therefore, that the accounting department brings together a record of the activities of each of the main departments of a business. He will see, too, how the final output or product of the accounting department must be a summarization and interpretation of these departmental activities in order to provide a basis for the various executives on which to formulate their judgments and business policies. Accounting is, therefore, a handmaiden of the executives in the conduct and management of the business. It is the purpose of this volume to develop the technique of the bookkeeping and accounting record and to indicate some of its uses in the management of business.

=Relation of Accountancy to Economics.=—Economics is sometimes defined as the science of wealth, by which is meant a body of classified knowledge relating to wealth in the aggregate. Under the present-day political and social system, the ownership of wealth is very largely private. Furthermore, the division of labor, as industry is now organized, has been carried to a very high degree. Because of these facts the present elaborate organizations for producing wealth have given rise to an urgent need for some effective means of keeping record of their activities.

The effort of every individual engaged in industry is to increase wealth. He labors to extract the raw materials from nature, to shape and mould them so as to supply the wants of his fellowmen. He then distributes them by means of markets and exchanges so as to secure the greatest possible returns for his effort. As competition becomes keener and the margin of return per unit of product becomes smaller, he has to increase his volume of business to secure the same amount of profit as when he did a lesser volume of business.

To produce goods it is necessary to use the saved wealth of former periods to pay the expenses of materials, labor, management, etc., of the present period. One must consume wealth to produce wealth. After his product is made, he must seek the best market for its exchange or sale. This necessitates the use of a complex system of transportation and communication. Finally, during the whole process of production and exchange the estimated returns from the article must be distributed among the several parties engaged in their creation. To make this distribution on the basis of estimated returns, gives rise to the need—the absolute necessity—of an accurate record of the costs of the activities and processes all along the line. The record, then, of the value of the rights and properties of the various parties to the production and distribution of wealth, as society is now organized for its economic well being, is the special field assigned to Accountancy as related to Economics.

=Relation of Accountancy to Law.=—The determination of the rights of the several parties to the creation, exchange, and ultimate consumption of a product is the field of Law, more particularly Business Law. The determination by means of its records of the value and extent of these rights is the province of Accountancy as related to Law. Accountancy is thus seen to be the handmaiden of both Economics and Law. None of them can progress far without the help of the other two. All being related to, and arising out of manifold human endeavors, their progress and development is dependent upon, and limited only by, the progress of these endeavors.

=The Fundamental Problem of Accountancy.=—The aim of all private businesses being the increase of wealth, the first problem of accountancy is to determine how much wealth is invested in a given enterprise and what ownership or proprietorship exists at given periods, so that by comparison the increases and decreases in the proprietorship may be known. When accurate information is obtained, an intelligent plan of action can be adopted to remedy such ills of the business as are shown and to increase any profitable line of activity. Accordingly, proprietorship and its changing values are the basic problems of accountancy as well as of business.

=Definition of Terms.=—Before proceeding to a definition or determination of proprietorship, it is necessary to understand what is meant by the terms "assets" and "liabilities." The root idea of the word "assets" is "sufficiency." Specifically, assets are the "entire property of all sorts, of a person, association, or corporation applicable or subject to the payment of debts." Similarly, the liabilities of a person, firm, or corporation are his or its pecuniary obligations or debts. Proprietorship is the difference between the value of the assets and the amount of the liabilities, and is defined and measured by the equation:

Assets - Liabilities = Proprietorship

This proprietorship equation is a basic formula. It is also written:

Assets = Liabilities + Proprietorship

It will thus be seen that proprietorship represents the equity of the owners of an enterprise in its assets. The assets are first applied in paying the claims of creditors of the business, and whatever of them remains belongs to the owners of the business.

=Development of the Proprietorship Equation—The Balance Sheet.=—To indicate the basis of the standard form of the proprietorship equation, several illustrations will be given. The equation is in its simplest form when it indicates proprietorship in a new business immediately after the owner has invested cash to provide the business with capital. For example, assume that on January 1, 19—, James T. Runyon starts business by investing $5,000 cash capital in the enterprise.

Here the proprietorship equation is:

Assets (cash $5,000) = Proprietorship ($5,000)

As yet there are no liabilities. However, in order to carry on his business, Runyon must purchase a stock of merchandise and equipment for his store. Accordingly, he purchases store furniture and fixtures from Lowell Brothers for $500, of which he pays $250 in cash, and owes the balance. He also buys a stock of groceries for $2,500 from Reid Murdock & Co. on 10 days' time. He now has more assets than the original $5,000 cash, but he has become indebted for the additional amount, so that the amount of his proprietorship has not changed—as is shown by the following equation, somewhat more complex than the first:

ASSETS - LIABILITIES = PROPRIETORSHIP Cash $4,750 Lowell Bros. Furniture 500 Claim $ 250 Merchandise 2,500 Reid Murdock Claim 2,500 ------ ------ $7,750 - $2,750 = $5,000

Runyon now begins operations and after six months finds that his activities have comprised the purchase of delivery equipment for $300 cash; sale of goods amounting to $6,000; the payment of $1,000 cash for rent, clerk hire, and advertising; and sundry purchases of stock-in-trade and other items as needed. As a result he now has $1,000 cash on hand; customers owe him $3,000; his stock of goods still on hand is worth $2,100; he owes creditors $1,000 for goods bought and his clerks $50 for services rendered.

It is readily seen that as the number of assets and liabilities increases, the method of showing them that was used above becomes awkward and cumbersome; therefore, still using the equation, we make the following vertical tabulation to determine and show proprietorship:

Assets Cash $1,000.00 Customers 3,000.00 Merchandise 2,100.00 Furniture 500.00 Delivery Equipment 300.00 --------- Total Assets $6,900.00

Liabilities Creditors for Merchandise $1,000.00 Clerks for Services 50.00 --------- Total Liabilities 1,050.00 ---------

Proprietorship

Capital $5,850.00 =========

This method of expressing the proprietorship equation is called a "Balance Sheet," or "Financial Statement."

Further analysis of the above information discloses the amount of Runyon's purchases and of his payments to creditors. Taking the transactions involving cash, we find that he had $5,000 to start with and received $3,000 from sales, or $8,000 in all. He bought furniture and delivery equipment for $800, and paid expenses of $1,000, in all $1,800. There is therefore a balance of $6,200 to be accounted for. $1,000 cash is still on hand, so that he must have paid creditors $5,200. Since he still owes creditors $1,000 for goods bought, his purchases must have been in all $6,200.

The ability to make accounting statements and to analyze accounting data for various purposes constitutes a very important part of the equipment of the accountant.

CHAPTER II

ASSETS, LIABILITIES, AND CAPITAL

Before discussing the form and content of the balance sheet and some of its major uses, the chief classes of assets, liabilities, and proprietorship or capital will be explained so that the student will have an intelligent notion of what is meant by each asset, liability, and capital item.

=Kinds of Assets.=—Accounting terms are not wholly standard. An account title is often used in one business to include items not mentioned under that title in another business. One finds also terms and titles peculiar to particular businesses. However, there is a tendency towards a standardization of the terms used in balance sheets. It is the purpose here to present and explain those which are common to practically all businesses. These include the asset titles Cash, Notes Receivable, Accounts Receivable, Merchandise, Investments, Deferred Charges or Expense Assets, Furniture and Fixtures, Delivery Equipment, Buildings, and Land.

CASH. Cash includes all kinds of money and usually whatever serves as a medium of exchange, which is in the possession or control of the business—deposits in banks, moneys in the safe and cash drawers, and sometimes funds in the possession of agents. Checks received in the regular course of business and not yet deposited in the bank are usually classified as cash.

NOTES RECEIVABLE. The formal promises to pay, made by others for debts owed the business, are classified under the general title Notes Receivable. Time drafts drawn on the debtors of the business and accepted by them may be included under this title, although they are sometimes shown under a separate title, such as Acceptances Receivable. This is particularly true when the acceptances are trade acceptances. It will be seen later that the promissory note has a somewhat different legal status from the open account claim against a debtor, and should therefore be classified under such title as will indicate the exact nature of the item.

ACCOUNTS RECEIVABLE. These usually represent the claims of the business against its trade customers for goods sold on open account and not paid for. The term is, however, broader than this, being sometimes used—although the practice is to be deplored—to include all claims against debtors except those which are in the form of notes.

MERCHANDISE. This asset represents the stock-in-trade in which the business deals. It is of course a sort of revolving asset, that is, merchandise is purchased and sold continuously, so that the stock-in-trade is constantly being turned over. The rate of turnover is very important, as will later be seen.

INVESTMENTS. This asset represents the stocks and bonds of other companies, municipalities, school districts, and so forth, owned by the business. As a usual thing there are seasons of the year when the cash funds of a business are built up and lie idle in the bank unless they are invested in securities of some sort. These securities can be reconverted into cash when the business requires a larger fund of cash.

DEFERRED CHARGES. Certain types of expenditure are necessary in every business to secure operating supplies. Fuel must be purchased for heating and power purposes; brooms, oil, waste, and other similar supplies are needed for cleaning and maintaining the business plant; stationery, stamps, wrapping paper, twine, cartons, packing materials, and so forth must always be on hand; insurance policies giving protection against fire are usually purchased for from one to three years and so are seldom completely used up at any given date. All items of this sort, necessary for the operation of the business but not dealt in as stock-in-trade, are called “expense assets.” The portions of these assets on hand at a given time, the use of which will be deferred to a later period, are classified as “deferred charges.”

FURNITURE AND FIXTURES. A business plant must be equipped with furniture and fixtures suitable for the display of the stock-in-trade, for the accommodation of customers, for the care and protection of the necessary records of the business, for the efficient performance of duties by the employees, and for other similar purposes. Assets of this type which are not a permanent part of the business plant but are removable should the business desire to change location, are listed under the title of Furniture and Fixtures. This may be subdivided to suit conditions. Sometimes several titles—Store Furniture and Fixtures, Office Furniture and Fixtures, Factory Furniture and Fixtures, Machinery and Tools—are used.

DELIVERY EQUIPMENT. If a business delivers its commodities it will usually have its own delivery equipment. This may comprise horses, wagons, harness, automobile trucks, and so forth. The delivery equipment may be used for both inbound and outbound deliveries.

BUILDINGS. All buildings owned by the business, whether used for business purposes or not, will usually be classified under the asset title Buildings. Store, office, factory, warehouses, residences owned and rented to employees—all assets of this type are to

be listed here.

LAND. This item represents land—city lots, plant sites, and so forth—owned in fee simple or subject to mortgage. Sometimes when a plot of land is leased for a term of years and a lump sum payment made at the beginning of the lease, the asset may be included either under the title Land, or under the broader title Land and Leaseholds.

=Kinds of Liabilities.=—Just as with assets, there is not entire uniformity in terminology for the various classes of liabilities. The more common types of items met with are: Notes Payable, Accounts Payable, Accrued Expenses, Mortgages Payable, Bonds Payable, and so forth.

NOTES PAYABLE. These represent the formal promises to pay, signed by the business or its owners. They represent the formal claims of others, that is, creditors, against the business. Just as with notes receivable, it is sometimes desirable to make a more distinct classification of notes payable. In such cases the titles Acceptances Payable, Trade Acceptances Payable, Long-Term Notes Payable, etc., are used.

ACCOUNTS PAYABLE. Under this title are listed the liabilities to creditors on open account, as distinguished from those formally acknowledged by a written promise to pay. These include obligations to trade creditors for merchandise, supplies, equipment, and property of almost any kind purchased for use by the business. In a broad sense an account payable includes any item for which the business is liable.

ACCRUED EXPENSES. Accrued Expenses represent usually the accumulating but unpaid claims against the business for service rendered it, as distinguished from the Accounts Payable, which usually represent purchases of an asset of one kind or another. Thus the amounts due at a given time to employees for work done since the last date of payment of their wages, salaries, or commissions, to the landowner for the rent of leased premises, to lenders for interest on moneys borrowed, are items properly to be listed under this title.

MORTGAGES PAYABLE. These represent the claims of creditors against particular properties owned by the business but against which the creditors have been given a lien or preferred claim as security for the borrowed or unpaid amount. Mortgages are evidenced by a formal legal document and are usually recorded in the county clerk's office.

BONDS PAYABLE. These are a type of long-term mortgage which is split into lots of more or less standard amount and so made available to a larger number of holders than is usually the case with the ordinary mortgage payable. This type of liability is limited almost exclusively to corporations.

The student should realize that usually the owner or owners of a business enterprise have both assets and liabilities other than those employed in the business. These personal properties and obligations of the owners are not to be taken into account when showing the proprietorship of a business unit or enterprise. They are to be considered only in showing the total proprietorship of any individual owner, when of course all of his properties, both inside and outside of the business, must be listed.

=Kinds of Proprietorship.=—Proprietorship, called also Net Worth, is shown under such titles as Capital, Investment, Capital Stock, Surplus, Undivided Profits, Reserves, and so forth. The title used depends largely on the type of organization under which the business is operated.

CAPITAL. Under this title is shown the amount of the investment of each owner in a single proprietorship or partnership business. To show each owner's share in the ownership the title Capital is preceded by his name. Illustration of this is given on pages 19 and 20.

INVESTMENT. This title usually is synonymous with capital. Sometimes it is used to indicate the amount of original investment in the business as distinguished from the present investment.

CAPITAL STOCK. Under this title is indicated the sum total of the portions of net worth owned by the shareholders as evidenced by stock certificates and subject to their individual control. On page 20 is given an explanation of the way in which the proprietorship or net worth of a corporation may be composed of two (or more) parts: (1) the capital paid in by the owners; and (2) the capital, representing profits made but not distributed to the owners. While capital stock usually represents the capital contributed by the owners, it sometimes arises from other sources, such as the distribution of a stock dividend; but the portion of the net worth owned and controlled individually by the owners is the capital stock.

SURPLUS. In a corporation this represents the second portion of the net worth, as indicated in the preceding section. Surplus is sometimes defined as the excess of the net worth over the capital stock. In other words, it is the difference between the assets and the sum of the liabilities and the capital stock.

UNDIVIDED PROFITS. This is a term used chiefly in financial institutions to indicate the portion of the net profits concerning the disposal of which no action has been taken.

RESERVES. Under this title are included whatever portions of the surplus are set aside or reserved for specific purposes.

Where Surplus, Undivided Profits, and Reserves appear as parts of Net Worth, they together represent the difference between Net Worth and Capital Stock. The reason for the careful segregation of these items from the Capital Stock is given in the explanation of the corporate form of organization, on page 20.

=Types of Business Organization.=—Before proceeding with a discussion of proprietorship as it appears on the balance sheet, the three general types of business organization will be treated briefly, because the manner of indicating proprietorship is dependent to a certain extent on the type of organization. These types are: (1) the single or sole proprietorship, (2) the partnership, and (3) the corporation.

=The Single Proprietorship.=—The simplest form of business enterprise is that conducted by a single proprietor. This form is well adapted to businesses where the capital necessary for efficient production is small, where the processes are simple and capable of being handled by the average individual, and where the risks are slight. Very few legal obstacles are placed in the way of the individual desiring to go into business for himself, nor is a great deal required of him. In some cases registration and a license are necessary. The observance of the general laws, concerning the payment of taxes and of local regulations concerning disease and fire is all that is usually expected. Subject to the general restrictions which ordinary business acumen and foresight impose, one can enter practically any field of enterprise, as a single proprietor, have entire freedom and privacy in the conduct of his business, and share with none the results of his endeavor.

On the other hand, these conditions oftentimes prove to be decided disadvantages. As industry is at present organized, many fields of activity demanding large capital and many kinds of technical knowledge, are closed to the single proprietor. Freedom of action carries with it sole responsibility, and oftentimes the counsel and advice of others would prevent the disasters which sometimes overtake the single owner of a business.

=The Partnership.=—A partnership is “a contract of two or more legally competent persons to combine their money, property, skill, and labor, or some or all of them, for the prosecution of some lawful business and to divide the profits and bear the losses in certain proportions.” There are different kinds of partnerships, as will later be shown, but the essence of each from the point of view of a working organization is mutual agency, each partner being the agent of the others, and, within the limitations of the partnership agreement, capable of acting as a principal for the firm. The partnership is subject to practically as few restrictions as the individual. In some localities, to secure the right to sue and be sued in the firm name, it is necessary to file in a public office a brief statement of the firm name and the names of its members.

The chief advantages of the partnership are larger capital and therefore access to fields closed to the individual; the combining of the business wisdom, skill, and knowledge of several individuals; the subdivision of duties and therefore the opportunity for specialization. While in the view of the business community the partnership is an entity or a business unit, it is not so in the sight of the law, each member of the firm being held liable to creditors for the entire debts of the partnership as if it were his sole business. If any one member has to pay the firm debts, he has a claim against his copartners for contribution.

Some of the disadvantages of this type of organization are the possibility of friction among the partners and consequent delay of action; the extension to the firm of credit based not on the firm property but rather on the total property of the members, and the consequent liability of each partner and his entire private fortune for the debts of the firm.

It is important to note that the partnership agreement should be very carefully drawn to cover in detail the relations of the partners, their duties and their rights, particularly as to their shares in the profits or losses of the firm.

=The Corporation.=—The corporate type of business organization is distinguished from the other types discussed:

1. By the freedom of each owner from the personal liability for the debts of the business to any greater extent than his stock interest in the business, though frequently in financial corporations, and in a few states for all corporations, his liability is double that stated.

2. By each share of ownership being evidenced by a formal document called a certificate of stock.

3. By each owner being allowed a voice in the affairs of the business only to the extent of his stock ownership therein.

4. By the necessity of securing from the proper authorities permission to do business.

5. By the necessity of complying strictly with the terms of this permit and submitting to certain requirements such as the filing of annual reports, payment of special taxes, and the like.

The owners of a corporation, or its stockholders as they are called, conduct the business through a board of directors which they elect for that purpose and they review its management periodically, usually annually. In this way they exercise indirect supervision over the business. This remoteness of personal interest and supervision has been somewhat overcome by electing to the board only those largely interested in the business, and by retaining on the board those whose ability as managers has been tried and proved. The board usually hires and delegates to others the active management of affairs.

The advantages of the corporate form of organization are: (1) it limits the liability of its owners; (2) it lends itself well to accumulation of the large funds of capital necessary for the promotion of large-scale enterprises; and (3) it secures through its board of directors a convenient and effective means of centralized control and management.

=Showing the Proprietorship of These Types=.—The methods of showing in the balance sheet the proprietorship for these three types of organization differ somewhat. The title under which proprietorship is listed is Capital. In a single proprietorship such title is preceded by the proprietor’s name, as shown in the following illustration:

Assets Cash $2,000.00 Accounts Receivable 5,000.00 Merchandise 3,000.00 Furniture and Fixtures 500.00 --------- Total Assets $10,500.00

Liabilities Accounts Payable $4,450.00 Due Clerk 50.00 --------- Total Liabilities 4,500.00 ---------- _Proprietorship_ James Runyon, Capital $ 6,000.00 ==========

In a partnership the capital is not shown in one item, each partner’s interest being stated separately, thus:

Assets Cash $ 2,500.00 Accounts Receivable 10,250.00 Merchandise 8,750.00 Furniture and Fixtures 625.00 ---------- Total Assets $22,125.00

Liabilities Notes Payable $ 1,660.00 Accounts Payable 5,465.00 ---------- Total Liabilities 7,125.00

Proprietorship Represented by: James Runyon, Capital $ 8,000.00 Philip Adams, Capital 7,000.00 $15,000.00 ---------- ==========

In a corporation, proprietorship is shown by the aggregate of the outstanding shares of stock, which are valued at a fixed par, or cost, under the single title Capital Stock, and if the proprietorship is greater than that indicated under this title, the excess is listed separately under the title Surplus or some of the other proprietorship titles already explained. This method of showing proprietorship is prescribed by law and is an effort to inform creditors, or those who may become creditors, that the corporation has observed the legal requirement not to distribute to stockholders any of its original capital. Hence, the capital stock of the corporation must be listed separately from the other items of proprietorship. Any changes in proprietorship during the life of the corporation are taken care of under these other titles, somewhat as illustrated below.

Assets Cash $ 1,850.48 Notes Receivable 1,645.65 Accounts Receivable 15,285.35 Merchandise 10,045.94 Supplies 1,145.37 Furniture and Fixtures 1,636.97 Delivery Equipment 1,427.50 Buildings 8,000.00 Land 2,000.00 --------- Total Assets $43,037.26

Liabilities Accounts Payable $ 5,762.26 Notes Payable 4,250.00 Salaries Due but Unpaid 25.00 Mortgage on Land and Buildings 3,000.00 ---------- Total Liabilities 13,037.26

Proprietorship Represented by: Capital Stock $25,000.00 Surplus 5,000.00 $30,000.00 ---------- ==========

CHAPTER III

THE BALANCE SHEET

=Purpose and Use.=—The balance sheet of a business is designed to show its financial condition at a given time. As previously illustrated, it marshals the assets in one list or schedule, and the liabilities in another. The difference between the totals of the two schedules gives the present or net worth of the business. In compiling a balance sheet it is not sufficient to give simply the figures of proprietorship or net worth; schedules of assets and liabilities must be drawn up to show the items making up that net worth. From the viewpoint of a prospective investor or purchaser, a banker to whom the business has applied for a loan, or a concern considering the advisability of extending it credit on a bill of goods, it makes all the difference in the world to know that with a net value of $10,000 the business has assets of $15,000 and liabilities of $5,000; or to know that its assets are $260,000 and its liabilities $250,000.

The ratio of total assets to total liabilities is almost as important information to an investor, purchaser, banker, or creditor as is the character of the assets and liabilities. If the assets are in properties for which there is not a ready market and the liabilities are claims which mature soon and will have to be met, the situation is unfavorable. If there are large values invested in easily salable assets; if there is a large balance of cash on hand after meeting current claims and providing for those which will soon mature; if other liabilities are of a more permanent nature, such as mortgages or long-time notes not requiring immediate attention—the situation may show evidence of too large a capital, or of inefficient management as indicated by the failure to invest a part of the surplus cash in properties from which some return might be secured.

=Form and Content.=—Questions of the kind raised above are not usually capable of definite answer from the information contained on the balance sheet alone. Oftentimes information as to the volume of business done, future plans for expansion or contraction of business operations, and so forth, is needed in addition to that supplied by the balance sheet. Of immediate interest to us, however, is the information contained in the balance sheet. Here two main problems are met: that relating to the form of the balance sheet, and that concerned with the content of the balance sheet.

By form of the balance sheet is meant its physical appearance—the arrangement and classification of its items. The form is not standard. In this country there are few legal regulations governing the way in which the records of a business are to be kept or its reports are to be made. Some efforts have been made, however, to establish a more or less standard form of balance sheet and to secure the use of standard titles in the balance sheet so that wherever found those titles can be relied upon to mean one and only one thing. Because balance sheets are not always drawn up for similar purposes, such regulations should not be too inflexible. The form of any business statement or report should always have regard to the purposes it is to serve. Standardization of form is desirable within this limitation.

By content of the balance sheet is meant the items that are admitted to it and the basis of their valuation.

These two problems of the balance sheet—form and content—are fundamental and will be briefly considered here.

=Titles—Main and Group.=—Instead of “Balance Sheet,” other terms are used as names for the statement itself, such as “Financial Statement,” “Statement of Resources and Liabilities,” “Statement of Assets and Liabilities.” Within the statement, Resources is an alternative title for Assets; and Net Worth, Present Worth, and Net Assets, for Proprietorship. For the present, use of the terminology previously employed will be continued, with the substitution, however, of the term Net Worth for Proprietorship.

The title of a statement should be full; it should include the name of the business enterprise and date, and should appear somewhat as follows:

SHONGOOD & GOODWELL BALANCE SHEET December 31, 19—

As stated, this should be followed by the schedules of Assets, Liabilities, and Net Worth. Since the statement is a formal one, due regard should be had for its general appearance, which should be neat and attractive. Further consideration will be given to some of these features in Chapters XXVI and XXVII.

=Classification and Arrangement.=—As indicated above, the balance sheet is used to picture the financial condition of a business at a given time. Some of the questions which arise in determining the financial condition of a business have already been mentioned. The chief use to which a balance sheet is put is the determination of the solvency of the business for purposes of getting credit extensions. By solvency is meant the ability of the business to pay its debts when due. Regardless of how great the excess of assets over liabilities is, if it is tied up in assets which cannot be used for the payment of debts, the creditors of the business will become impatient and may ask a court to take the control of the business away from its owners and place it in the hands of a representative of the court and the creditors, who will conduct the business for the purpose of converting assets into

cash to a sufficient extent to pay all debts.

A balance sheet should therefore be so arranged that the condition of the business, viewed from the standpoint of its ability to pay its debts, will be clearly and easily determinable. Cash is usually the only medium used for the payment of debts. In the regular course of business, debts are incurred which come due at different dates. Hence it is not necessary to have on hand at a given time cash sufficient to pay all of the debts of the business. Certain classes of debts will not wait. The sums owed employees for services must usually be paid when due. The debt to the government for taxes, to the public service company for heat, light, and power, to the landlord for rent, to the bank for money borrowed—all these debts must usually be paid immediately as they come due.

The cycle of business operation includes the purchase of merchandise, the payment of operating expenses, and the conversion of merchandise into cash through sale, either directly, as when the sale is for cash, or indirectly as when credit is extended a customer and cash is later collected from him. This cycle or turnover of merchandise recurs constantly in the management of the financial affairs of a business. It is necessary so to order the buying and selling of goods and the collection of accounts from customers that there will be on hand at all times sufficient cash to pay the expenses of operating the business and the debts contracted in the purchase of merchandise. This is the vital and fundamental problem of the business executive. In the solution of that problem it may sometimes be necessary to borrow funds from the bank. Before lending money, the banker assures himself that the business will be in a position to repay the borrowed money when due.

The balance sheet, accordingly, should be so arranged that the condition of the business as related to its ability to pay its debts will be apparent. This requires a classification or marshaling of the assets which are concerned in the trading cycle on the one side, and the liabilities which must be assumed in conducting the business during the trading cycle, on the other.

At the head of the list of assets is the item Cash, the most liquid of all, as it can be used directly for the payment of debts. Following Cash come in order Notes Receivable, which, with proper indorsement, can be sold to the banker and converted into cash almost immediately; Accounts Receivable, which represent the claims against customers for merchandise sold and which are collectible within the term of credit extended to the customer; and finally, the Merchandise on Hand, which must be sold either for cash or on credit and then converted into cash by the collection of the outstanding accounts. Sometimes, also, there is included in this group the asset Investments, representing stocks and bonds of other companies which can be converted into cash by sale on a stock exchange. On such securities, and also on the notes receivable, there is usually at the date of the balance sheet some interest which has accrued and may not yet be collectible. It is customary to include the amount of this interest receivable in the same group with the assets from which it arises.

This group of assets, comprising Cash, Notes and Accounts Receivable, Merchandise, and so forth, is called the group of Current Assets. Asset items are classified as current if conversion into cash is expected within three to six months. These are the assets to which the current creditors of the business will have to look for the payment of their claims.

The claims of current creditors are usually included under the titles Notes Payable, Accounts Payable, and Accrued or Unpaid Expenses. The classification of a creditor in the current liability group is usually determined on a time basis. Thus, all debts that will have to be met within six months' or one year's time from the date of the balance sheet are usually classed as Current Liabilities.

The excess of current assets over current liabilities is called the working capital of the business; that is, an amount of the current assets equal to the current liabilities will have to be used for the payment of these debts, leaving the excess or difference free for use within the business. While it is not possible to determine, without considering all the circumstances in a given case, how large this working capital should be, the standard rule-of-thumb is that it should equal the amount of the current liabilities. It will thus be seen that the standard ratio of current assets to current liabilities is two to one. The solvency of a given business is always judged by a comparison of the current asset group with the current liability group.

The next main group of assets is given the title Deferred Charges. The content of this item was explained on page 12. Thus, if a management has paid some of its expense bills in advance—rent for January paid during December, for example—when showing its financial condition as at the end of December it is proper and necessary, in order to make an accurate showing, that all such prepaid expenses be listed as assets; for, had the payment not been made until the service which it purchased had been used up, the asset cash would have been larger by the amount of the prepaid expenses.

Similarly, with regard to the Accrued Expenses mentioned on page 14, whatever expenses have been incurred that properly belong to the past period, such as wages due but unpaid, are liabilities; for the cash would be smaller by the amount of such postponed or

accrued items had the claims been met during the period. The close relationship of both deferred charges and accrued expenses to cash is thus apparent—the one as an indirect addition to the cash, the other as an indirect deduction from or claim against cash. Accordingly, deferred charges are shown on the balance sheet immediately following the group of current assets, whereas accrued expenses are listed with the current liabilities as noted above.

The next group of assets is called Fixed Assets. Under this title are listed those assets which are used for carrying on the business but are not bought for the purpose of being resold. A certain amount of capital must be invested in the physical business plant. Furniture and fixtures, delivery equipment, buildings, land, machinery and tools, and so forth, must be purchased before the business can commence operating. It is assets of this type that comprise the class of fixed assets. There is a corresponding group among the liabilities which are known as Fixed or Long-Term Liabilities. All debts maturing a year or more after the date of the balance sheet are classed as fixed liabilities. As examples of this class, we have long-term notes payable, mortgages payable, bonds payable, and so forth.

The difference between the fixed assets and the fixed liabilities indicates the amount of owner's capital which has been invested in the business plant.

The final group of assets is called simply Other Assets, and includes all assets which cannot be classified in any other groups, such as good-will, patents, trade-marks, accounts and notes receivable having a credit term longer than six months, and other similar items. If there are any liabilities not capable of classification in the two groups of liabilities given above, they may be put in a group called Other Liabilities.

For the purpose of an easy showing of these various groups and their titles, it is customary to list the amounts of the several detailed items of each group in an inner money column, and to extend the total into the adjoining money column on the line of the last item in the group. A similar arrangement is made of the groups of liabilities so that not only the items in the various groups but the group totals as well are available. The totals of the various groups give the grand totals for the assets and the liabilities respectively.

The balance sheet as now classified and arranged provides first a formal title, giving the name of the business and the date of the balance sheet; then the assets, under which appear the groups Current Assets, Deferred Charges, Fixed Assets, and Other Assets; under the liabilities appear the groups Current Liabilities, Fixed Liabilities, and Other Liabilities. The showing of Proprietorship or Net Worth under the three different kinds of ownership has already been set forth. The illustration on page 31 shows a typical form of classified balance sheet. This should be studied carefully, as it is the type which will be used hereafter.

=The Problem of Content.=—The form of the balance sheet serves the purpose of making easily available the information contained in the balance sheet. Form is of little value unless the content is accurate. What a balance sheet contains is, after all, far more important than its form. The problem of content comprises a consideration of two points: (1) the proper inclusion of all items, both assets and liabilities, belonging in the balance sheet; and (2) the correct valuation of the items so included.

With regard to the first, it may be said briefly that care must be exercised to see that all assets belonging to the business and having value, and that all claims against the business of whatever nature, are included.

Assuming that a given balance sheet contains a list of _all_ the assets and _all_ the liabilities, the further problem of the proper valuation of these items must be considered. A balance sheet in which the title Cash includes counterfeit bills, N. G. (that is, uncollectible) checks and other similar items, would not be considered a reliable balance sheet. Similarly, the basis for the valuation of each of the asset items must be investigated and determined correct before the balance sheet may be considered to represent the true financial condition of the business. It is the experience of every business that it cannot collect all of the credits extended to customers. Regardless of how carefully credit is granted, it will be found that some customers do not pay their debts. Accounts and notes receivable must, accordingly, be valued with a proper consideration for the estimated amount of the uncollectible portion. The stock of merchandise on hand must be valued according to the standard formula, at cost or market, whichever is the lower. The deferred charges group of assets will show the value of the unconsumed portions of the assets purchased, with due regard to the time element. Thus, a three-year insurance policy purchased at the beginning of the year will at the close of the year be valued at two-thirds of its original cost. The fixed asset group will be valued at cost less depreciation, which represents the amount of the loss in value of the assets due to wear and tear, lapse of time, and obsolescence.

In determining liabilities, providing they have all been included, there is not the danger of an understatement, because their amount is subject to verification on the basis of the creditors' claims. For obvious reasons the liabilities are seldom overstated.

=General Principles Governing Form and Content.=—In drawing up a balance sheet, the form must be flexible enough to meet whatever requirements for information may be placed upon it. Thus, a balance sheet to be presented to the banker as the basis of a loan should be carefully classified so as to show clearly the financial condition, and sufficient detail should be given to indicate the basis used in valuing the various items. A balance sheet drawn up for publication may, on the other hand, contain less detailed information and less attention need be given to its form. A balance sheet drawn up for use within the business itself may well contain very full information and its form should be such as will accurately portray the status of affairs. A balance sheet which shows on its face that cognizance is taken of uncollectible accounts and of the loss in fixed assets due to depreciation, is much more valuable as a financial statement than one lacking that information, provided of course it is to be used to indicate that consideration has been taken of those elements. Excepting for the general remark that regard must always be had to the purpose for which the balance sheet is drawn up, no hard-and-fast rule can be laid down in the matter of the relative fullness of detail with which it should be made.

=Illustration.= To illustrate the features of the balance sheet discussed in this chapter, the following statement showing the financial condition of the partnership of Jackson & Edwards is given:

JACKSON & EDWARDS BALANCE SHEET June 30, 19—

Assets Current Assets: Cash $ 2,365.00 Accounts Receivable $8,500.00 _Less_—Reserve for Doubtful Accounts 170.00 8,330.00 --------- Merchandise 10,425.00 $21,120.00 --------- Deferred Charges: License Fees Paid in Advance $ 175.00 Unexpired Insurance 75.00 Supplies 80.00 330.00 ---------- Fixed Assets: Furniture and Fixtures $ 750.00 _Less_—Reserve for Depreciation 75.00 $ 675.00 --------- Buildings $9,680.00 _Less_—Reserve for Depreciation 242.00 9,438.00 Land 2,500.00 12,613.00 --------- --------- Total Assets $34,063.00

Liabilities Current Liabilities: Notes Payable $2,500.00 Accounts Payable 6,750.00 Wages Accrued 250.00 Interest Accrued 75.00 $ 9,575.00 --------- Fixed Liabilities: Mortgage on Land and Buildings 2,500.00 ---------- Total Liabilities 12,075.00 --------- _Net Worth_ Represented by: S. J. Jackson, Capital $10,267.00 P. R. Edwards, Capital 11,721.00 $21,988.00 ---------- ==========

CHAPTER IV

THE COMPARATIVE BALANCE SHEET

=Comparison of Net Worths.=—The aim of every business enterprise is to increase its net worth. If James Runyon at the beginning of the year is worth $5,000 and at its close $7,500, it is evident that he has increased his wealth by $2,500. Very little information is given him or anyone else as to the manner in which the increase took place, except that it came about in the ordinary course of business. No criterion is given by which to compare effort with result. An increase of $2,500 may or may not be commensurate with the labor expended in effecting it. However, since a business is not likely to remain stationary, there is a degree of satisfaction in knowing merely the extent of the change in its net worth. The taking of an inventory, the appraising of the value of the assets from time to time, and the setting of the liabilities for the same dates over against them, is the method of determining the corresponding net worths. A comparison of these net worths shows their increase or decrease during the period. A further analysis of the individual items may be made. A comparison of each asset at the beginning of the period with its value at the end of the period, shows the increase or decrease in that item. A similar comparison of each liability item brings out the increase or decrease during the period.

=How a Gain or Loss May Be Evidenced.=—During a period a gain or increase in net worth may come about in one of four ways:

1. The assets may remain the same and the liabilities may decrease. 2. The liabilities may remain the same and the assets may increase. 3. The assets may decrease but the liabilities suffer a greater decrease. 4. The assets may increase but the liabilities undergo a smaller increase.

Provided no more money has been invested in the business, and none has been withdrawn, there has been in all the above instances an increase in net worth, that is, a profit has resulted. If the reverse of the above relationships obtains, there has been a decrease in net worth, or a loss.

The following statements illustrate the points discussed above.

AARON CONNERS BALANCE SHEET, June 30, 1921

Assets Cash $ 1,000.00 Notes Receivable 250.00 Accounts Receivable 5,250.00 Merchandise 8,500.00 Store Fixtures 525.00 ---------- Total Assets $15,525.00

Liabilities Accounts Payable $ 5,365.00 Notes Payable 1,250.00 ---------- Total Liabilities 6,615.00 ----------

Net Worth Aaron Conners, Capital $ 8,910.00 ==========

One year later Conners' financial condition is shown to be:

AARON CONNERS BALANCE SHEET, June 30, 1922

Assets Cash $ 850.00 Notes Receivable 100.00 Accounts Receivable 6,425.00 Merchandise 10,260.00 Store Fixtures 472.50 Delivery Equipment 350.00 ---------- Total Assets $18,457.50

Liabilities Accounts Payable $ 6,192.75 Notes Payable 950.00 Accrued Salaries 50.50 ---------- Total Liabilities 7,193.25 ----------

Net Worth Aaron Conners, Capital $11,264.25 ==========

The various types of information essential to judging the financial condition as disclosed by the above balance sheets will now be discussed.

=Comparison of Balance Sheets.=—A comparison of balance sheets gives more information than merely the amount of profit for the year. It indicates trends in the business. Thus a comparison of the notes and accounts receivable for the two years may give some indication of the vigor with which collections are pressed. If the volume of business done, that is, the amount of sales made, was about the same during the two years, and if there are more uncollected accounts at the close of the second year than at the close of the first, it would tend to show that collections were less satisfactory during the second year. Investigation may show that this is due to general conditions of business in the country rather than to failure to push collections vigorously. If there is any marked change in the amount of the stock of merchandise on hand it would invite inquiry. If the stock is much larger at the end of the second year than at the end of the first, it might indicate that the business man is speculating in merchandise, that he considers the buyer's market during the year particularly favorable and has laid in an abnormally large stock. A banker with large experience in similar businesses can formulate a fairly accurate judgment of how much working capital a concern should have invested in merchandise. With that as a criterion he can tell the normal amount of merchandise the business should carry.

A comparison of current liabilities for the two periods will indicate the extent to which borrowed working capital is being used. Thus, an unusual increase in stock-in-trade may be offset by an equally large increase in current liabilities, and so would indicate that the merchant has done his buying on credit or has used borrowed working capital to increase his stock. The danger of this is apparent in a fluctuating merchandise market, particularly if the swing is generally downward. A comparison of the working capital for the two periods gives useful information. A decrease in the amount of working capital may indicate an investment of it in fixed plant which, if continued, will lead to trouble with current creditors. An increase in working capital may point to the advisability of greater sales effort.

A comparison of fixed assets for the two periods will show the increase or decrease in the plant investment. If this has been offset by a corresponding increase or decrease in fixed liabilities, no additional capital of the owners has become tied up in fixed plant, while the reverse is true if there is not that correspondence between fixed assets and fixed liabilities. Where the ratio between current liabilities and fixed liabilities has increased, it may point to the desirability of funding some of the current debt. Short-term liabilities have apparently been incurred for the purpose of extending the fixed plant. It is usually desirable to convert, that is, fund these current liabilities into long-term liabilities in order to conserve working capital to pay current debts.

Thus it is seen that a proper understanding of the items in the two balance sheets and of their various interrelationships will oftentimes give very valuable information. Banks and business houses which are called upon to extend credit, maintain regular files of credit information, including periodic balance sheets, concerning their present and prospective customers, so that they can judge fairly accurately the condition of the businesses.

=The Comparative Balance Sheet—Its Content and Form.=—A comparison of the above balance sheets shows an increase of net worth of $2,354.25 during the year. It shows also that this profit is accounted for by an increase of $2,932.50 in the assets, which is offset by an increase of $578.25 in the liabilities, leaving a net increase of $2,354.25.

The two statements thus separated do not lend themselves easily to a comparison of individual items. Accordingly, a method of showing the comparison known as the “Comparative Balance Sheet” form is used. This brings all the data into juxtaposition and so makes comparison easy. The balance sheet for the current year is shown first, followed by that for the preceding year. The increase and decrease column uses the current year as a basis for comparison with the preceding year.

AARON CONNERS COMPARATIVE BALANCE SHEET June 30, 1922 and June 30, 1921

Increase and _Assets_ 1922 1921 Decrease Current Assets: Cash $ 850.00 $ 1,000.00 - $ 150.00 Notes Receivable 100.00 250.00 - 150.00 Accounts Receivable 6,425.00 5,250.00 + 1,175.00 Merchandise 10,260.00 8,500.00 + 1,760.00 ---------- ---------- --------- $17,635.00 $15,000.00 + $2,635.00 ---------- ---------- --------- Fixed Assets: Store Fixtures $ 472.50 $ 525.00 - $ 52.50 Delivery Equipment 350.00 + 350.00 ---------- ---------- --------- $ 822.50 $ 525.00 + $ 297.50 ---------- ---------- --------- Total Assets $18,457.50 $15,525.00 + $2,932.50 ---------- ---------- ---------

Liabilities Current Liabilities: Accounts Payable $ 6,192.75 $ 5,365.00 + $ 827.75 Notes Payable 950.00 1,250.00 - 300.00 Accrued Salaries 50.50 + 50.50 ---------- ---------- --------- Total Liabilities $ 7,193.25 $ 6,615.00 + $ 578.25 ---------- ---------- ---------

Net Worth Aaron Conners, Capital $11,264.25 $ 8,910.00 + $2,354.25 ========== ========== =========

While it is true that a great deal of valuable information can be secured from a comparative balance sheet, and that this form of balance sheet locates definitely the changes in the asset and liability items, summarizes those changes, and shows the net profit, it nevertheless fails to disclose the forces within the business organization which have brought about the changes—it sets forth effect or result but not cause. A supplementary or rather a complementary statement is needed to show the reasons for the changes. This is discussed in the following two chapters.

CHAPTER V

THE ECONOMIC OR PROFIT AND LOSS ELEMENTS OF A BUSINESS

=Fuller Information Needed.=—As indicated in Chapter IV, in the summarization of the business transacted during a given period, it is not usually sufficient to know how much net worth has changed; nor is the whole story told when it is known exactly what items are responsible for the change, that is, which of the properties are worth more and which are worth less at the end than at the beginning of the period. Additional information is necessary to account for the changes shown by the comparative balance sheet.

The proprietor who knows simply that his cash is $1,000 less now than it was at the corresponding time in the last fiscal period, has not the kind of control over his business that his competitor has who knows that the $1,000 was expended for an increased stock of goods, or that an outstanding liability of that amount has been settled, or that his expenses for the period have been larger by $1,000 than for the former period. His competitor may be worse off but he at least has the advantage of knowing the reason for his being so. He has made a correct diagnosis of the pulse beat of his business. If he cannot heal its ills or secure aid for it, he can at least have the satisfaction of giving it a respectable burial, and the autopsy will then disclose that he failed to take advantage of his information until it was too late.

However, the point should be clearly held in mind that the proprietor who knows exactly what is happening in his business is in a position to exercise a definite and sure control over it. Hence, the accounting department, to justify its existence, should aim to give full information as to what is taking place within the business and what eventually will be the result in its financial life. Only in this way can the department serve as a means of control.

=Kinds of Records.=—A business must have assets and usually must incur liabilities; a plant must be used, stock-in-trade must be bought, and sold, and usually sufficient capital must be provided for the extension of credit to customers. Capital for the payment of the operating expenses of the business, the maintenance of the plant, the payment of salaries and wages of employees, and so forth must at all times be provided. While it is true that the balance sheet shows the financial condition of the business, it gives little information as to the volume of business operations. It indicates the net worth and may even indicate the increase or decrease in net worth if the comparative balance sheet is used. Yet as to how that increase or decrease in net worth came about, little or no

information is given. The balance sheet, in other words, is static; it indicates a quiescent state. It is a snapshot, showing the wheels of business momentarily stopped.

To give a full survey of the operations during a given period, a motion picture of the events between the dates of the balance sheets must be shown. Such a picture is dynamic. It gives a realization of the whirl and bustle of business being carried on. It pictures volume, content, and extent, whereas the balance sheet indicates the state arrived at as of a given moment. For purposes of management, which must control all the phases of business activity, a balance sheet is insufficient. A review of the factors producing results up to a given time must be had. Accordingly, the accounting department must supply not only information as to the present state of the assets and liabilities, but also information which indicates how the changes in assets and liabilities since the last fiscal period were brought about—what volume of transactions occurred, what expenditures of assets and energy were necessary to accomplish the results attained. This information, for purposes of internal management, is more vital than that concerning simply the present status of assets and liabilities. It is complementary to that obtained by a comparison of net worths and it is therefore explanatory of the changes in net worth.

=The Net Worth Section Expanded.=—In its operation of buying and selling goods, a business executes many different types of transactions. As was indicated in Chapter I, in the development of the proprietorship equation, some types of transactions have no effect on proprietorship, that is, they involve neither a profit nor a loss; while other types of transaction—the really vital types, because it is for these that the business is carried on—involve a change in proprietorship, either increasing or decreasing it. Goods are bought for one price and sold at a price sufficiently higher to pay for all the expenses of operating the business and leave a reasonable margin of profit. For example, goods may be bought for $1,000 and sold for $1,800, bringing about an increase of $800 in the sum total of the assets. This $800 may represent temporarily an increase in proprietorship but the increase must be used first to meet the expenses of operating the business during the period in which the sale is made, after which the net result represents the real or permanent increase in proprietorship. The temporary increase of $800 is offset by a temporary decrease of, say, $600 for operating expenses. It is vital to business management to have information not only concerning the net increase in proprietorship but also concerning these temporary increases and decreases. To give this information the net worth section of the balance sheet might be expanded as in the illustration given below.

EDWIN MARKHAM BALANCE SHEET, December 31, 19—

Assets Cash $ 5,000.00 Accounts Receivable 75,000.00 Merchandise 20,000.00 Plant 50,000.00 ---------- Total Assets $150,000.00

Liabilities Accounts Payable $30,000.00 Accrued Expenses 5,000.00 Mortgage on Plant 30,000.00 ---------- Total Liabilities 65,000.00 --------- _Net Worth_ Edwin Markham: Capital at the beginning of the year $70,000.00 Profits during the year: Sales $200,000.00 Cost of Goods Sold 140,000.00 ----------

Temporary Increase in Proprietorship $ 60,000.00 Operating Expenses 45,000.00 ---------- Net Increase in Proprietorship 15,000.00 ---------- Capital at the end of the year $ 85,000.00 ----------

In the net worth section of this balance sheet, the capital with which the owner started operations for the year is given first. To this is appended a summary of the operations for the year resulting in a net increase in proprietorship which, added to the beginning capital, gives the capital in the business at the end of the year. This method of setting up the information concerning the operations of the business is not used to any extent because the information is of such vital importance that it deserves more display. Accordingly, a separate statement, known as the “Statement of Profit and Loss,” or “Statement of Business Operations,” is drawn up to explain the balance sheet net worth item, Net Increase in Proprietorship for the year, which shows just the amount of the net profit. The detail of this item is given in this complementary statement. The above illustration is given merely for the purpose of pointing out the relationship between the statement of operations and the balance sheet. From this it will be seen that the statement of profit and loss is really a part of the net worth section of the balance sheet.

TEMPORARY PROPRIETORSHIP RECORDS.—The proprietorship records, indicating as they do the sources of changes in net worth, are kept day by day as transactions take place, are summarized at the close of the period, and the net result is determined. They are called temporary because, as is seen, they do not at the time of record have regard for the final change in proprietorship. At the end of the regular periods, to determine the total or final change, the temporary proprietorship records are closed or transferred to the summarized record called the “Profit and Loss Summary.”

Referring to the case of Aaron Conners discussed in Chapter IV, assume that the accounting department furnishes the following additional information from its records:

During the year from July 1, 1921 to June 30, 1922, Conners bought $22,362.50 worth of goods; his sales amounted to $28,465.20; he paid for help $3,050.50; his other expenses were $2,405.45; and he estimated the wear and tear on furniture at 10%, or $52.50. As shown in his statement for 1922, he had $10,260 worth of merchandise on hand on June 30, 1922.

The analysis of this information explains the changes in his net worth during the year. The goods he started with plus those purchased during the year are the total goods to be accounted for, which amounted to $30,862.50 ($8,500 + $22,362.50 = $30,862.50). These goods were accounted for by his sales during the year and the amount on hand. Knowing how much was on hand June 30, 1922, viz., $10,260, he determined that the goods sold must have been the difference or $20,602.50 ($30,862.50 - $10,260 = $20,602.50). The price which he received for these goods sold was $28,465.20; hence, his profits from sales were $7,862.70, the difference between selling price and cost.

We find, also, that the expenses he incurred in selling his goods and conducting his business generally were $3,050.50 for clerk hire, office help, delivery boys, etc.; and other expenses, such as rent, taxes, repairs, delivery upkeep, supplies, heat, light, and the like, amounted to $2,405.45. He estimated that his store fixtures depreciated in value $52.50. All these items, representing costs of doing business, amounted to $5,508.45 ($3,050.50 + $2,405.45 + $52.50 = $5,508.45), which subtracted from his profits from sales, $7,862.70, gives him a net gain of $2,354.25 ($7,862.70 - $5,508.45 = $2,354.25). This gain tallies with the increased proprietorship of that amount shown by the balance sheet of June 30, 1922.

Without regard to a form which would be technically correct, the data of the preceding paragraphs may be shown as follows:

Goods on hand at the beginning, July 1, 1921 $ 8,500.00 Goods bought during the year 22,362.50 ---------- Total goods to be accounted for $30,862.50 Goods accounted for, now on hand 10,260.00 ---------- Goods accounted for, by being sold $20,602.50 ==========

Selling price of goods sold $28,465.20 Cost price of goods sold, as above 20,602.50 ---------- Profit from sales $ 7,862.70 Expenses of doing business: Clerk hire $3,050.50 Other expenses 2,405.45 Depreciation 52.50 --------- Total expenses 5,508.45 ---------- Net profit, or increase in net worth $ 2,354.25 ==========

The technical form of the summary of the temporary proprietorship elements will be presented in the next chapter.

CHAPTER VI

THE PROFIT AND LOSS SUMMARY

=Type of Information Needed.=—The need and purpose of the information to be furnished by the temporary proprietorship records was pointed out in Chapter V. Without information of this sort, proper control of business operations cannot be exercised. These records supply a summarized picture of the activities of the business during a definite period, which have as their goal the increase in proprietorship—the making of a profit. In attaining this goal, two main types of activities or operations are entered into, usually classified under the heads of: (1) income or earnings, by which is meant those activities which immediately and directly increase proprietorship; and (2) expenses or outgo, comprising those activities which decrease proprietorship. Expenses are the costs incurred in securing income, and are therefore deductions from it. A fuller explanation of these terms will now be given.

=Income.=—Income is usually of two types: operating and non-operating. These terms are always relative; that is, what is an operating income in one business may be a non-operating income in another business. The term “operating income” is used to indicate the main sources of income in a given business. It is always the duty of the accounting department to indicate the sources of income. Thus in a trading or mercantile business, the selling of goods to customers is the main source of income. In a professional business, the selling of services, often titled “professional fees,” is the main source; in a brokerage or commission business, commissions earned; in institutions, tuition and other fees; in a financial business, interest earnings; in a society, membership fees. These are typical titles for indicating the main source of income in the several kinds of undertakings mentioned.

While sales are the major source of income in a trading concern, there may be supplementary sources. It may own stocks and bonds from which income may be derived. In a manufacturing or mining enterprise the company may own dwelling houses and rent them to its employees. Conditions of travel and communication may also force it to provide stores, places of amusement, and so

forth for its workers. From all these supplementary activities it will derive income. As it was not organized primarily for these purposes, but chiefly to manufacture, or mine a commodity, the income from these collateral activities is classed as non-operating income.

The distinction, then, between operating and non-operating income is, as mentioned above, always a relative one and will be determined in any given instance on the basis of major activities and supplementary or minor activities. Some of the titles under which income is recorded will now be explained:

SALES. Under this title is recorded the amount of sales of the stock-in-trade in a merchandising or manufacturing concern. The two elements included here, namely, the decrease of the asset merchandise and the increase of proprietorship—the true income element—will be discussed later.

SALES RETURNS. This title does not represent income but, as its name indicates, shows the amount of the goods sold which have been returned because of dissatisfaction with the quality or condition of the goods or some error in sending the wrong kind.

SALES ALLOWANCES. These are similar to sales returns in that they indicate a deduction from the sales income for the allowances made to the purchasers who for one reason or another have just cause to be dissatisfied with the goods but agree to retain them providing an allowance from the original selling price is made.

INTEREST INCOME. Under this title is recorded the income from money loaned or credit extended. Notes receivable and bonds are the usual sources. Sometimes open accounts receivable also bring interest.

RENTAL INCOME. Under this title is recorded income received from the lease of premises, lands, or buildings.

PROFESSIONAL FEES. Under this title is recorded the income from charges made for professional services.

COMMISSIONS EARNED. Included under this title is the income received from services rendered in the selling of commodities for a principal.

PURCHASE DISCOUNT. This represents the deduction allowed from the original charge for paying a debt in advance of the date named in the purchase contract.

=Expenses.=—Expenses are also of two types: operating and non-operating. The same distinction is made here as with income. Those expenses incurred in securing operating income are operating expenses, while those incurred in securing non-operating income or for other purposes are called non-operating expenses.

To secure control over the operating and non-operating types of activities, it is necessary to compare operating income with operating expenses, and non-operating income with non-operating expenses, in order to measure the return by the effort expended in securing that return. Some of the more common titles under which the record of expenses is made are as follows:

SALARIES (WAGES). Under this title is included the cost of the services rendered by employees. This may be classified in accordance with the department in which the service is rendered; for example, factory wages, salesmen’s salaries, office salaries, and so forth.

TRAVELING EXPENSES. The costs of railroad fare, entertainment, and so forth, when traveling in the interests of the business.

ADVERTISING. The cost of publicity in making known the commodities offered for sale by the business.

BUYING EXPENSE. The costs incurred in making purchases for the business. These may comprise the salaries of buyers and all expenses in connection with maintaining a purchasing department.

RENT. The cost for the use of premises not owned.

PLANT MAINTENANCE. The cost of upkeep, repairs, and so forth, on the plant used by the business. The cost, by purchase or manufacture, of light, heat, and power is included here.

DEPRECIATION. The decrease in value of a fixed asset due to wear and tear, lapse of time, obsolescence, etc.

BAD DEBTS. The amount of outstanding accounts receivable which have proven or are judged to be uncollectible.

SALES DISCOUNTS. The cost incurred because of the financial policy of charging a customer a smaller amount than the amount of the bill, provided he pays by a given date.

TELEPHONE, TELEGRAPH, STATIONERY, POSTAGE, INTEREST COST, COMMISSIONS PAID, AND SO FORTH. These all indicate by their titles the nature of the expense or cost items.

The student should understand that expenses may be set up in very much greater detail than that indicated by the above titles. Usually the title under which record of an expense is made will indicate with sufficient clearness its character.

=The Profit and Loss Summary.=—As indicated in Chapter V, the profit and loss summary shows the manner in which the net worth of the business has been changed as the result of operations of the business, as distinguished from changes brought about through withdrawal or investment of capital. Although it is really a part of the balance sheet, which shows financial condition, because of its importance it is, however, set up as a separate statement. It amplifies and fills out the record shown by the balance sheet. It is a supplementary record because it gives additional information, and is complementary to the balance sheet because it rounds out and completes the story of business life there recorded.

Just as with the balance sheet, the main problems of the profit and loss summary relate to: (1) its form; and (2) its content. After an explanation of some of the terms used in connection with the summary, these two problems will be discussed.

=The Fiscal Period.=—Because of the work involved and the frequent incompleteness of the records at the close of each day, a daily statement of condition is very seldom made up. The business experience of a particular enterprise determines the frequency of preparation of these statements. Whatever the period may be between statements, be it a month, three months, a half-year, or a year, it is called the fiscal period, i.e., it is the period at the end of which records are summarized for the purpose of ascertaining the profit or loss for the period. For purposes of comparison with preceding and following fiscal periods, under similar conditions, the fiscal period should be, and usually is a period of regular length—a half-year or year being perhaps the most common, though in many enterprises it is customary to draw up supplementary monthly statements.

=Need for the Physical Inventory.=—Again, because of the work involved, especially where the product dealt in is small in value and sales are numerous—as in stores dealing in clothing, food, and the like—no record of the cost of each article is kept as it is sold, only the sale price being recorded. It is not possible, therefore, to determine from the records as usually kept, the cost of the goods on hand at a given time. The records are kept in this way, not because systems of accounting cannot be devised to make both records, but because the results obtained by such systems are not justified by their cost when other and less expensive means can be used with almost as satisfactory results.

The customary method of finding the cost of goods sold was indicated in Chapter V. Summarized, it requires that from the sum of goods on hand at the beginning and those purchased since, there be subtracted the goods on hand and unsold at the close of the period. This last item, the goods on hand and unsold, is secured by making an actual count and valuation of such goods at the close of the fiscal period. The expedient of physical inventory-taking is therefore brought in as an aid to the accounting records, but only in the interests of economy.

Form of Profit and Loss Summary

GENERAL PRINCIPLES GOVERNING MAKE-UP. The profit and loss statement, as the complement of the balance sheet, is just as formal in character and the same general considerations govern as the make-up of the balance sheet, viz.: (1) the general purpose it is to serve; (2) the likelihood of obscuring essential facts through too great detail; and (3) the general appearance is to legibility, clearness of form and expression, and arrangement on the page.

TITLE. The heading of the summary must show the name of the business, followed by the title of the summary and the statement of the exact period covered by it. It was noted in Chapter V that whereas the balance sheet is a statement of financial condition as at a given date, the profit and loss summary is a statement of operations which have taken place during a given period. Hence, it is not sufficient merely to state the date of the close of the period. If, as is usually the case, the fiscal periods are of uniform length in a given business, the phraseology “For the Period Ending ...” will be sufficient for use within that business. It is better, however, for all statements of operation to indicate the length of the period covered. A typical heading for the profit and loss summary is indicated below:

JAMES R. ROBINSON & COMPANY STATEMENT OF PROFIT AND LOSS For the Six Months' Period Ending December 31, 19—

ARRANGEMENT. The arrangement of the summary has already been indicated. The income from operations, that is, the operating income, is shown firsthand, and is followed by the operating expense, and then by the amount of the difference or the net result of operation. Next is shown the non-operating income, followed by the non-operating expense. The net result of this combined with the net result from operations gives the net result for the period, which is the figure shown on the balance sheet, the detail of which is explained by the profit and loss summary.

=Content of Profit and Loss Summary.=—The content of the profit and loss summary is determined by the need of information for purposes of management. A profit and loss summary which is sufficient for a small business, where the proprietor is in intimate contact with all phases of the business, would not give sufficient information for the proper control of a large business, where the managing executives are dependent for their information as to the various phases of business activity on reports made to them. There is, however, a fairly standard outline or skeleton in accordance with which this summary is usually drawn up. It is the purpose here to explain that outline.

The first section of the statement has for its purpose the separation of the sales item into its two elements, referred to above: (1) the Cost of Goods Sold, which indicates the amount by which the asset merchandise has been decreased through sale of goods; and (2) the Gross Profit or the excess of selling price ever cost, out of which must be met the costs of operating the business before the net change in proprietorship can be determined. This section is usually spoken of as the "trading" section of the statement. The set-up of this section shows, accordingly: (1) the Sales item, from which is shown deducted the amounts of sales returns and sales rebates and allowances in order to arrive at the figure of net sales; and (2) the Cost of Goods Sold, under which is listed the cost of goods sold as explained in Chapter V. This cost requires the showing of the initial inventory, the purchases for the period, the inward costs of laying down the merchandise at the place of business, such as insurance on goods in transit, freight and cartage costs, and so forth. From the sum of these items will be shown deducted the returned purchases and the amount of the final inventory, the difference indicating the cost price of goods disposed of by sale. With the "inward" cost of goods is sometimes included the sum total of all buying expenses. In other cases, particularly where a complete purchasing department is maintained, a separate buying expense section is set up to summarize these costs.

Following this trading section comes the formal statement of operating expenses which are usually classified for purposes of information into the groups: Selling Expenses, General Administrative Expenses, and Financial Management Expenses. Under each one of these groups should be listed the detailed items. Thus, under the selling expense group should be shown such items as salaries to salesmen; the traveling expenses incurred by them; the cost of publicity, advertising, and so forth; the sales management expense; and the delivery expenses, although these expenses are sometimes set up in a group by themselves.

The student will note that under the head of selling expenses are grouped all of the direct costs incurred in making sales.

Under the general administrative expenses should be shown such items as office salaries, stationery and supplies, postage, telephone and telegraph, light, heat, insurance, depreciation, and all other items which cannot be charged to definite departments of the business but must be borne by the business as a whole.

Under financial management expense should be listed the various items of expense which represent the financial activity of the business as related to its major purposes and which are operating financial expense items. Here will be shown such items as interest on money borrowed for operating the business; sales discounts granted customers in order to secure cash payments from them at an earlier date than the limit of the normal credit period allowed them; collection costs, and so forth.

A final section of the _operating_ portion of the profit and loss statement lists the items of income arising out of the management of the working capital finances of the business. Interest received on customers' notes and on cash balances in the bank, and purchase discounts, are usually the only items of income under this head.

The difference between gross profit on sales and the sum of these operating expenses minus the financial income, is the operating profit of the business, sometimes called Net Operating Profit.

The section following this is devoted to the marshaling of the items of Non-operating Income and Expense. Whichever of these two groups is the larger is set up first, and from its total is deducted the total of the other group. The net amount is then shown extended under the item of net operating profit, to which it is added if it is a net income item and from which it is subtracted if it is a net

expense item. The resulting figure is the Net Profit for the period.

Occasionally there are extraordinary items of profit or loss not to be classified under any of the above heads, which have to be shown in additional sections of the profit and loss statement. These are matters which will be taken up later.

It should be noted that the above paragraphs outline a simple statement of profit and loss for a commercial or trading business as distinguished from an industrial or manufacturing enterprise, the statement for which is somewhat more complex even in its general outlines.

=Algebraic Content of the Profit and Loss Statement.=—An algebraic presentation of the profit and loss statement is oftentimes valuable. The cost-of-goods-sold portion becomes:

(1) Initial Inventory + Purchases - Final Inventory = Cost of Goods Sold

(2) Sales - Cost of Goods Sold = Gross Trading Profit

The rest of the statement is covered by the following equation:

(3) Gross Trading Profit - (Selling Expenses + General Administrative Expenses + Financial Management Expense - Financial Management Income) ± (Non-operating Income - Non-operating Expense)

= Net Profit

=The Disposition of the Net Profit.=—The net profit for the period belongs to the proprietor and constitutes an increase in his proprietorship or investment, unless he has already drawn out some of these profits as they accrued. In this case, his drawings must be subtracted from the net profit indicated before showing the increment to his net worth. Accordingly, a final section of the profit and loss statement may give the disposition of the net profit and its appropriation or addition to the previous net worth or proprietorship item. This section, when used, is known as the appropriation section. If the business is a partnership, this section should show in detail the distribution of net profit among the several partners according to the agreement among them as to the proportions in which they are to share gains or losses. If a corporation, it should give the disposition made of the net profit in the way of dividends to the stockholders, and any other appropriation made of these profits, including transfer to surplus.

Two illustrations—one very simple, the other more complex—typical of profit and loss summaries are given for the guidance of the student.

Illustration 1

AARON CONNERS STATEMENT OF PROFIT AND LOSS For the year ending June 30, 1922

Sales for the year $28,465.20 Goods on Hand July 1, 1921 $ 8,500.00 Purchases during the year 22,362.50 $30,862.50 --------- Goods on Hand June 30, 1922 10,260.00 --------- Cost of Goods Sold 20,602.50 --------- Gross Trading Profit $ 7,862.70

Clerk Hire $3,050.50 General Expenses $2,405.45 Depreciation 52.50 2,457.95 5,508.45 --------- --------- --------- Net Profit for the year $2,354.25 =========

Illustration 2

KIMBALL AND MOREY STATEMENT OF PROFIT AND LOSS For the Year Ending June 30, 19—

Sales $525,600.00 _Less_: Sales Returns $ 5,000.00 Sales Rebates and Allowances 600.00 5,600.00 ---------- ---------- Net Sales $520,000.00

Cost of Goods Sold: Inventory, July 1, 19— $ 96,670.00 Purchases during the year 350,000.00 Freight-In 1,000.00 Insurance (Goods in Transit) 750.00 $448,420.00 ---------- _Less_: Purchase Returns $ 1,750.00 Final Inventory, June 30, 19— 105,000.00 106,750.00 ---------- ---------- Cost of Goods Sold 341,670.00 ---------- Gross Profit $178,330.00

Selling Expenses: Salesmen’s Salaries $ 20,000.00 Advertising 25,000.00 Delivery Expense 5,000.00 $ 50,000.00 ----------

General Administrative Expenses: Office Salaries $ 10,000.00 Stationery and Supplies 1,500.00 Postage 250.00 Telephone and Telegraph 750.00 Light and Heat 1,750.00 Insurance (Stock and Fixtures) 1,500.00 Depreciation: Furniture and Fixtures $2,000.00

Buildings 1,500.00 3,500.00 --------- Miscellaneous Expenses 750.00 20,000.00 ----------

Financial Management Expenses: Interest Paid $ 250.00 Sales Discounts 5,000.00 Bad Debts 1,000.00 Collection Costs 250.00 6,500.00 ---------- ---------- Total Operating Expenses $ 76,500.00

Financial Management Income: Interest Received $ 1,350.00 Purchase Discounts 3,500.00 4,850.00 ---------- ---------- Net Operating Expense 71,650.00 ---------- Net Operating Profit $106,680.00

Non-Operating Expense and Income: Income--Interest on Liberty Bonds $ 2,000.00 Expense--Loss on Stocks Sold 900.00 1,100.00 ---------- ---------- Net Profit for the year $107,780.00 ========== Appropriation of Net Profit: J. H. S. Kimball, ■ share $ 43,112.00 H. F. C. Morey, ■ share 64,668.00 $107,780.00 ---------- ==========

=The Two Methods of Determining Net Profit.=—It is particularly important to note that the profit shown by the profit and loss statement must be the same as that developed by the comparative balance sheet, since both cover the same period and constitute merely two ways of developing the same result. For this reason they are valuable in proving the correctness of results, acting as checks against each other. The student must bear in mind, however, that the increase or decrease in net worth as shown by the comparative balance sheet must always be adjusted by taking account of additional investments or withdrawals of capital before the net profit for the period can be determined, and therefore before this figure can be used as a check against the amount of net profit shown by the statement of profit and loss.

The accounting department keeps both classes of records, viz., the asset and liability records and the temporary proprietorship or income and expense records, not because both are needed to develop the amount of net profit—either class would do this—but because both are needed for the additional information which they give and which is valuable and necessary for the intelligent management of the business.

CHAPTER VII

INTERRELATION BETWEEN THE ECONOMIC AND THE FINANCIAL ELEMENTS OF A BUSINESS, AND SOME INTER-RATIOS

=Various Aspects of the Temporary Proprietorship Records.=—The profit and loss statement has been explained as a summary of the temporary proprietorship records kept for the purpose of registering the changes in net worth as they occur from day-to-day, and also for the purpose of noting the source or cause of many of the changes in assets and liabilities. The temporary proprietorship records may be regarded as the chronicle or history of the economic life of the business. The efforts of the business to produce income with the least possible outgo in the form of costs or expenses, may be viewed as the work of forces or agencies striving towards that end. Every effort is offset by the cost of that endeavor, and unless the result of the effort be more than its cost, its aim, viz., the increase of net worth, is not accomplished.

=Relation between Profit and Loss and Financial Elements.=—These income-producing efforts are the agencies that bring about the changes in the values of assets and liabilities. Expenses and costs are incurred for the purpose of securing income. Every expense or cost that is settled causes a diminution of business assets, usually of the asset cash. If not settled, it causes an increase in the liabilities, usually the accounts payable, for the business becomes bound by or liable for it. Both of these conditions result in a decrease in the net worth.

On the other hand, every item of income, as when a sale of goods is made, is reflected in an increase of assets or a decrease of liabilities. The result of every sale is usually an increase in the cash or in the claims against persons, the accounts receivable. The sale may sometimes result in a lessening of liabilities through a cancellation of the claims of creditors by means of the claims against customers arising out of the sale. This would be true when goods are bought from, and sold to, the same person. Thus there is constantly a direct interrelation between the financial and the profit and loss elements of every business.

=Exchanges within the Asset and Liability Groups.=—All changes in individual assets and liabilities, however, are not always the result of business or economic forces. There may be an even exchange of one asset for another asset, as when delivery equipment is purchased for cash. The asset Delivery Equipment is increased by the same amount as the asset Cash is diminished. Or if a bill of goods is purchased on credit, an increase of assets is exactly offset by an increase in liabilities. These changes are illustrated in the second example in Chapter I, showing Runyon’s proprietorship.

It is seen, therefore, that the changes in individual assets and liabilities are not so certain an index of changes in proprietorship as those registered by the temporary proprietorship records. The vital history of a business is its profit and loss record, the story of its economic life. As a means of control this is of first importance because it chronicles the causes of most changes in financial condition. The statement of financial condition may be looked upon as a picture of the framework, the skeleton of the business personality, upon which is superimposed its economic structure. When both the financial framework and the profit and loss summary are given, it is possible with reasonable accuracy to tell the whole history of the business activities for the period covered.

=Confusion between Profit and Loss and Balance Sheet Items.=—The beginner frequently has trouble in making a proper classification of income items and sometimes of expense items. Take Interest Income as an example. The asset Cash Received is confused with the title Interest Income, which denotes the source of the cash received. The accounting department maintains both types of records. The receipt of cash arising out of interest income would be classified and recorded under two heads: (1) the asset Cash, to indicate the increase in that asset; and (2) the temporary proprietorship record Interest Income, to give the profit and loss information necessary for purposes of management.

Similarly, the beginner oftentimes confuses the sales income record with the cash record of a cash sale transaction. Also, when cash is disbursed for expense purposes, the decrease in the asset is often confused with the expense record. When an expense is incurred it brings about either a decrease in assets, usually cash if the transaction is settled at once; or an increase in liabilities, usually an accrued expense item if the transaction is not immediately settled. Accordingly, in making the record the accounting department must show the decrease in the asset or the increase in the liability in the balance sheet group of records and the source of that decrease or increase under some expense title in the profit and loss group of records. Familiarity with the titles appearing in the profit and loss statement should prevent this confusion.

=Illustration.=—To show the interactions between the balance sheet and the profit and loss groups of records, the following illustration is given. There is shown first a comparative balance sheet, indicating the condition of a business at the beginning and the end of a period. This comparative balance sheet, it will be noted, shows a net profit of $33,250. There is also given a statement of profit and loss, showing the sources of the income and the expenses of the business. The statement indicates a net profit of $33,250 for the period. By starting with the financial condition as indicated by the balance sheet at the beginning of the period and working into it the operations for the year as shown by the statement of profit and loss, and by using the balance sheet at the end of the period as a goal, we can trace the probable interaction of the two types of records for the period.

JACKSON L. GORDON COMPARATIVE BALANCE SHEET December 31, 1922 and December 31, 1921

Increase and Assets 1922 1921 Decrease Cash $ 10,000.00 $ 15,000.00 - $ 5,000.00 Accounts Receivable 100,000.00 119,000.00 - 19,000.00 Merchandise 70,000.00 65,000.00 + 5,000.00 Unexpired Insurance 1,000.00 250.00 + 750.00 Plant and Equipment 350,000.00 325,000.00 + 25,000.00 ---------- ---------- ---------- Total Assets $531,000.00 $524,250.00 + $ 6,750.00 ---------- ---------- ---------- _Liabilities_ Notes Payable $ 30,000.00 $ 35,000.00 - $ 5,000.00 Accounts Payable 50,000.00 40,000.00 + 10,000.00 Accrued Sales Salaries 2,500.00 1,500.00 + 1,000.00 Mortgage Payable 150,000.00 200,000.00 - 50,000.00 Depreciation Reserve Plant and Equipment[1] 50,000.00 32,500.00 + 17,500.00 ---------- ---------- ---------- Total Liabilities $282,500.00 $309,000.00 - $26,500.00 ---------- ---------- ---------- _Net Worth_ Jackson L. Gordon, Capital $248,500.00 $215,250.00 + $33,250.00 ========== ========== ==========

[1] The student should note the manner of showing depreciation reserves in the comparative balance sheet. This is done solely for the purpose of eliminating the detail column in the assets needed to handle the subtraction item. This method of showing is countenanced only in comparative statements where saving of space is a chief consideration.

JACKSON L. GORDON STATEMENT OF PROFIT AND LOSS For the Year Ending December 31, 1922

Sales $470,000.00 Sales Returns 20,000.00 ---------- Net Sales $450,000.00

Cost of Goods Sold: Merchandise on Hand December 31, 1921 $ 65,000.00 Purchases 305,000.00 Inward Freight and Cartage 15,000.00 $385,000.00 ---------- _Deduct_—Merchandise on Hand December 31, 1922 70,000.00 ---------- Cost of Goods Sold 315,000.00 ---------- Gross Profit $135,000.00

Selling Expenses: Sales Salaries $ 20,000.00 Advertising 30,000.00 Sundry Sales Expense 10,000.00 $ 60,000.00 ---------- General Administrative Expenses: Office Salaries $ 10,500.00 Insurance 3,000.00 Sundry Office Expense 2,000.00 Depreciation 17,500.00 33,000.00 ---------- Financial Management Expenses: Interest Cost $ 10,000.00 Sales Discounts 7,000.00 17,000.00

---------- ---------- Total Operating Expenses $110,000.00

Financial Management Income: Interest Income $ 250.00 Purchase Discounts 8,000.00 8,250.00 ---------- ---------- Net Operating Expenses 101,750.00 ---------- Net Profit for the year $ 33,250.00 ==========

INTERRELATION BETWEEN SALES INCOME, ACCOUNTS RECEIVABLE, AND CASH. In these two statements, if to the outstanding accounts at the beginning of the period we add the net sales for the period as shown in the profit and loss summary, and if from their sum we deduct the sales discounts allowed customers and the accounts outstanding at the close of the period, as shown by the comparative balance sheet, we arrive at the amount of cash received from customers during the year. This is shown by the following statement:

Accounts Receivable, December 31, 1921 $119,000.00 Net Sales for the year 450,000.00 $569,000.00 ---------- _Deduct_: Sales Discounts $ 7,000.00 Accounts Receivable, December 31, 1922 100,000.00 107,000.00 ---------- ---------- Cash Received from Customers during year $462,000.00 ==========

INTERRELATION BETWEEN PURCHASES, ACCOUNTS PAYABLE, AND CASH. The amount of cash paid for merchandise during the year may be arrived at similarly, as indicated by the following statement:

Accounts Payable, December 31, 1921 $ 40,000.00 Purchases during the year 305,000.00 $345,000.00 ---------- _Deduct_: Purchase Discounts $ 8,000.00 Accounts Payable, December 31, 1922 50,000.00 58,000.00 ---------- ---------- Cash Paid for Merchandise during year $287,000.00 ==========

INTERRELATION BETWEEN CASH AND OTHER BALANCE SHEET AND PROFIT AND LOSS ITEMS. If to the amount of cash on hand at the beginning of the period we add the cash received from customers, as determined above, and that received from interest income, as indicated by the profit and loss statement, we arrive at the total cash available for use during the period.

Cash expenditures have been made for the following purposes:

1. Payments to creditors for merchandise of $287,000 as above. 2. Inward freight and cartage $15,000, as shown by the profit and loss statement. 3. Sales salaries $19,000. (This amount is determined by considering the expense of $20,000, as shown by the profit and loss statement, in conjunction with the unpaid sales salaries, as shown by the comparative balance sheet. Thus, if to the unpaid sales salaries amounting to $1,500 at the beginning of the period, we add the sales salary expense of $20,000 incurred during the period and from their sum we subtract the amount of unpaid salaries, $2,500, at the end of the period, we arrive at the amount of $19,000 spent for salaries during the period.) 4. Advertising $30,000. 5. Sundry selling expense $10,000. 6. Office salaries $10,500. 7. Insurance $3,750. (This amount is also determined by considering the amount of unexpired insurance as shown by the comparative balance sheet in conjunction with the cost of insurance used during the current period, as shown by the profit and loss statement. It will be noted that $250 worth of insurance was in force at the beginning of the period, that $3,000 worth of insurance was used during the period—hence it must have been necessary to buy additional insurance amounting to $2,750 during the period. When we find, however, that there is unexpired insurance at the end of the period amounting to $1,000, it will be seen that there must have been purchased during the period $3,750 worth of insurance.) 8. Sundry office expense $2,000. 9. Interest cost $10,000. 10. Plant and equipment $25,000. (It will be noted from the comparative balance sheet that there has been a net increase of only $7,500 in plant and equipment. While $25,000 was added to the plant and equipment asset during the year, there was a decrease in value due to depreciation, amounting to $17,500, as shown by the profit and loss statement. This depreciation expense is reflected as a decrease in the value of the asset Plant and Equipment and does not therefore decrease the asset Cash.) 11. Notes payable $5,000—the decrease being shown by the comparative balance sheet. 12. Mortgage payable $50,000—also shown on the comparative balance sheet.

If from the total cash available for use there is deducted the cash expended, as indicated above, the difference should indicate the amount of cash on hand at the close of the period. This balance of $10,000, as indicated by the tabulated statement below, is the amount shown by the comparative balance sheet as being on hand.

Cash Receipts: Balance on Hand December 31, 1921 $ 15,000.00 From Customers, as above 462,000.00 Interest Income 250.00 ---------- Total Cash available for use $477,250.00

Cash Expenditures: For Purchases as above $287,000.00 Inward Freight and Cartage 15,000.00 Sales Salaries 19,000.00 Advertising 30,000.00 Sundry Selling Expense 10,000.00 Office Salaries 10,500.00 Insurance 3,750.00 Sundry Office Expense

2,000.00 Interest Cost 10,000.00 Plant and Equipment 25,000.00 Notes Payable 5,000.00 Mortgage Payable 50,000.00 467,250.00 ---------- ---------- Balance of Cash on Hand December 31, 1922, per Balance Sheet. $ 10,000.00 ==========

By a careful study of the interrelations between various items as explained above, the student will see that the interactions between all of the transactions for the year as set forth in the comparative balance sheet and the profit and loss statement, have been indicated and proved. The proof is secured in the tie-up between the figure of cash as shown by the cash statement, and that shown in the comparative balance sheet statement as cash on hand at the end of the period.

=Inter-Ratios and Their Uses.=—Before leaving the study of the balance sheet and profit and loss statement and their interrelations, it is desirable to explain certain ratios between items found on both statements. These are ratios which are watched very carefully in judging the financial condition of a business. Their significance is apparent.

1. MERCHANDISE TURNOVER. By merchandise turnover is meant the rate at which the merchandise stock is moved or turned over by sale during the fiscal period. The ratio expressing the rate of turnover is found by dividing the cost of goods sold, as shown in the profit and loss statement, by the average inventory carried for the year. Where there are available only the figures of opening and closing inventory, the amount of the average inventory is taken as one-half of the sum of these two inventories. The rate of turnover varies in different businesses, ranging as high as 15 or 20 in some and as low as 1 or 2 in others. The value of a rapid turnover is apparent. One dollar invested in merchandise where the rate of turnover is 10 is equivalent to $10 invested where the rate is only 1. The more work a dollar does, the greater the profit possibilities.

2. WORKING CAPITAL TURNOVER. The amount of sales as indicated by the profit and loss statement, divided by the working capital—the excess of current assets over current liabilities—as determined from the balance sheet, is called the “working capital turnover.” This indicates the rate at which the working capital is used in securing sales. Where the amount of working capital on hand varies markedly at different periods of the year, the average should be used as the basis for estimating the rate of turnover.

3. ACCOUNTS RECEIVABLE TO SALES. The fraction represented by dividing the amount of outstanding accounts at the end of the year by the volume of sales during the year, indicates the portion of sales which has not yet been collected in cash. If this fraction is multiplied by the length of the fiscal period, expressed in months, and the result compared with the normal credit term allowed customers, it will indicate the trend of collections. For example, if the outstanding accounts at the close of the period are $150,000, the sales for the year are $1,200,000, and the normal credit period is 30 days, it will be seen that by the above ratios the $150,000 of outstanding accounts represents on the average the sales for approximately 1½ months

(150,000) (--------- × 12 months = 1½ months). (1,200,000)

Since the credit term is only 30 days, the indication is that collections are slow and should be pushed more vigorously. It must be understood that this ratio indicates merely a trend and must be judged in the light of other significant facts in the business.

4. PROFITS TO NET WORTH. The net profit for the period divided by the net worth at the beginning of the period is used to indicate the per cent of earnings on the capital invested.

=Other Ratios.=—For the purpose of watching the progress of business operations, it is customary to develop the following ratios:

1. Cost of goods sold to net sales. 2. Gross profit to net sales. 3. Selling expenses to net sales. 4. General administrative expenses to net sales. 5. Net financial management expenses to net sales. 6. Net profit to net sales.

These ratios, set up each fiscal period and compared with similar ratios for previous periods, indicate very definitely the trend of income and expenses and are useful in the determination of business policies.

CHAPTER VIII

THE ACCOUNT

=The Goal of Account-Keeping.=—Throughout the preceding chapters constant reference has been made to records or data of the business furnished by the accounting department. Knowing the use made of these data in the compilation of financial and profit and loss summaries, we shall trace the process of gathering that information in exactly reverse order; first, through the ledger, where it is grouped and summarized in accounts and made ready for the preparation of statements; then into the books of original entry, where the information is first sorted and classified for posting to the proper ledger accounts, with a view always to fit it ultimately

into the final statements of financial and business condition; and finally, to the business papers arising out of the transactions, which are the basis or first source of all accounting records.

=The Ledger and Its Content.=—The ledger may be defined as the book of accounts. In it are collected most of the data needed for the final statements showing the financial condition of the business. By means of its account titles, it makes an analytical record of all transactions, according to the information desired, and through the mechanism of the account it groups and summarizes all data affecting each particular account, thus furnishing the proprietor with totals instead of items. In the ledger, therefore, must be kept two main classes of accounts, viz., those used for making up the balance sheet and those used for making up the profit and loss statement. The one group shows assets and liabilities, and the other temporary proprietorship increases and decreases brought about by the receipt of income and the payment of expenses. The ultimate or net proprietorship is determined by the summarization of all temporary accounts in the way shown in preceding chapters.

THE LEDGER ACCOUNT DEFINED.—An account may be defined as a record of one or more items, either similar or dissimilar, relating to the same person or thing, kept under an appropriate heading or title. The record is kept in such a way as to make easy the addition of similar items and the subtraction of dissimilar items. Accounts are kept both with persons, as the accounts receivable and payable already mentioned, and with things, such as land, buildings, machinery, merchandise, cash, and the like. Some asset accounts and some accounts kept with persons are usually composed of both similar and dissimilar items. For example, the cash account is composed of both cash received and cash paid out items; the accounts receivable record both the items for which the person is in debt to the business and those which show the cancellation or settlement of the debt, in part or in full; and the accounts payable record the items for which the business is in debt to the person and those which show cancellation of the debt or settlement by the business. Accounts which record income and expenses usually comprise only similar items, as where all sales of merchandise are recorded under one head or account and all purchases under another.

THE ACCOUNT TITLE.—The title given to an account is important. It should indicate clearly the content of the account. Accuracy is a basic necessity in accounting. Correct titles are therefore essential. A title which does not clearly and truthfully indicate the nature of the account, or one which is so chosen that under it may be recorded items of various and doubtful kinds, gives prima facie evidence of an imperfect knowledge of accounting principles or of a desire to hide data which will not bear close scrutiny. Therefore, care should be exercised in the selection of titles.

=The Two Sections of the Account.=—To separate similar from dissimilar items, the account is divided into two sections, a left and a right section, as we shall call them for the present, which are shown in the standard form given in Form 1.

The account head or title is placed in the center over the division line. At the extreme left of each section are the date columns—year, month, and day. Note particularly where the “year” is shown. The space following is for explanatory matter; the next column, left blank in the illustration, is a reference column whose use will be explained later; and the last column in each section is the money column, where the dollar subsection column is further divided into columns for each digit of the amount. Care must be exercised to observe such rulings when writing in the amounts. The account with Cash in the illustration shows on the left a receipt of $150.25 from J. B. Givens, and on the right, the payment of $5.50 for stationery. These two items are entirely dissimilar. Another receipt of $72.69 on January 3 from cash sales is shown on the same side of the account as the record of the previous receipt and directly under it. Note that the name of the month is not repeated.

=The Mechanism of the Account.=—Thus the mechanism of the account is designed not only to give a brief history of each item entered therein, but primarily to bring together all items of the same kind relating to that account, so that they may be summarized. It should be thoroughly understood that all items on each side of the account are similar items, though the two sides themselves are of exactly opposite kinds. Where the account has entries on both sides, i.e., is composed of dissimilar items, a comparison of the totals of each group shows the condition of the account. In the Cash account given, the total of the left side, $222.94, showing receipts, compared with the total of the right, $5.50, showing disbursements, indicates that there is $217.44 cash now on hand. It is evident, therefore, that the account is a mathematical device for holding on one side all items to be added and on the other all items to be subtracted. Only in this way can addition and subtraction be performed within the account.

[Illustration: Form 1. Form of Ledger Accounts]

=The Number of Accounts.=—The number of accounts to be kept in the ledger is determined by the minuteness of detail desired for the guidance of the management of a business. The financial and profit and loss statements usually lack detail and for this reason the items appearing thereon are frequently subdivided in the ledger into numerous accounts.

CHAPTER IX

THE ACCOUNT (Continued)

=The Balance of the Account.=—As stated in Chapter VIII, the account is divided into two sections, a left and a right, for the purpose of separating items relating to the same account which are dissimilar, and thus affording a comparison between the totals of these dissimilar groups. An account containing dissimilar items may have the same total on both sides, in which case it is said to balance, i.e., the class of items on one side exactly balances or cancels those on the opposite side; or one side of the account may be larger than the other, in which case the amount of the excess is called the “balance” in the account, or of the account. An account takes its nature or classification from the larger side, on which the balance appears. The account balances are shown in summarized form on the balance sheet or the profit and loss statement.

=The Account Title Indicative of Its Classification.=—The account title or name should be so plain as easily to indicate its main classification. The two main classes of accounts are, as stated above, those relating to assets and liabilities, or property—things owned and things owed; and those relating to proprietorship—those showing the increases or decreases in net worth. The title of an account should clearly indicate whether the account belongs to the asset or liability class, or to the proprietorship class.

The accounts called Cash, Accounts Receivable, Mortgages Payable, Accrued Wages, clearly show assets and liabilities; while those entitled Sales, Rent Income, Wages, Expenses, indicate factors affecting proprietorship.

=The Meaning of Account Balances.=—In the asset accounts the larger side, and therefore the balance of the account, is normally on the left, i.e., the balance of Cash, Land, Buildings, Furniture and Fixtures, Notes Receivable, and the like are normally left-side balances. It follows, therefore, that all entries showing the acquisition or increase of assets are made on the left side of their accounts, and all entries showing the disposal or decrease of assets are made on the right side of the accounts. Very seldom are the cancellations listed on the right side in excess of the assets listed on the left.

In the liability accounts the balance is normally on the right side because liabilities are subtraction items from the assets and should, therefore, normally be on the opposite side of the account. Notes Payable, Accounts Payable, Mortgages Payable, Interest Payable, Rent Payable, and the like, have normally right-side balances. It follows, therefore, that all entries showing the assumption of liabilities are made to the right side of the account, and all entries showing the cancellation of these liabilities are made on the left side. Rarely are liability cancellations in excess of the liabilities owed.

As will be explained in Chapter XII, in the group of accounts indicating decreases in proprietorship, the balance, or larger side, is normally on the left; in the group showing increases in proprietorship the balance is normally on the right. The balances of the accounts, Wages, Salaries, Rent Expense, and all other expenses, are normally left-side balances. It follows, therefore, that entries showing the cost of such expenses to the business are made on the left side of suitably named expense accounts, and entries showing a reduction in the expenses are made on the right side. Items for wages, for example, are shown on the left side of the Wages account, and any subtractions because of overpayment or for other reasons, are shown on the right side of the account.

The balances of the accounts Sales, Rent Income, Interest Income, and other kinds of income, are normally right-side balances. From this it follows that entries showing income are made on the right side of a suitable account, and entries indicating a reduction or subtraction from the income shown are made on the left side of the account. For example, income from sales is shown on the right side of the Sales account, while any reduction of that income, as when goods are returned by customers, is shown on the left side.

Knowing, therefore, to what main class each account belongs—asset, liability, expense, or income—one always knows on which side the balance is normally, and also that the items on the opposite side are subtraction items. Subtraction can be shown in the account only by thus separating dissimilar items.

=Relation of the Account to the Financial Statements.=—The equation of the balance sheet is the equation of the ledger. The fundamental proprietorship equation is written in two ways:

(1) Assets - Liabilities = Proprietorship (2) Assets = Liabilities + Proprietorship

The ledger (that is, the accounts in the ledger) is constructed in accordance with the second form of the proprietorship equation. In it are found all the accounts of the business, which are included under the classes Assets, Liabilities, and Proprietorship. Under

Proprietorship are the subgroups: (a) Net Worth, or capital at the beginning of the period, and (b) Current Profit or Loss. The Current Profit or Loss is in turn shown by the two groups of accounts: (1) Income, and (2) Expense. This classification of the accounts and their relation to the balance sheet are illustrated graphically in the chart shown in Form 2.

The asset accounts have net left-side balances, as previously explained. Hence, if all the detailed accounts which record assets are brought together, the sum total of the left-side balances of these accounts will represent the total assets of the business. Liability accounts have right-side balances, as also explained. Therefore, if all the accounts that record the liabilities of the business are brought together, the sum total of their right-side balances will represent the total liabilities of the business. The proprietorship accounts have right-side and left-side balances. The _net total_ of all the proprietorship accounts will be a right-side balance, however, and will show the present net worth of the business.

[Illustration: Form 2. Chart of Accounts]

Accordingly, when one views the accounts in the ledger in their fundamental groupings—namely, assets, liabilities, and proprietorship—it is seen that the equation of the balance sheet is also the equation of the ledger. The account is thus seen to be an integral part of the balance sheet. It is so arranged, however, as to sort and handle additions and subtractions and to furnish a net result for use in the balance sheet.

The asset portion of the proprietorship equation is in the ledger broken up into the various kinds of assets, record of which is desirable and necessary for purposes of adequate control of the business. In keeping the record, all the transactions affecting—that is, either adding to or subtracting from—a given asset are recorded in the account kept with that asset. In this way each account brings about a sorting of the transactions affecting it. It separates these transactions into two kinds, those which add to and those which subtract from its value, and by means of its net balance at any given time it summarizes the numberless transactions which have affected it during a period and gives a net result showing its present status.

In much the same way the liability item of the proprietorship equation is broken up in the ledger for purposes of detailed information, into a large number of individual liability accounts. The sum total of the balance of these accounts is the liability item of the proprietorship equation.

The proprietorship section of the equation is a little more complex when split up, as it is in the ledger. In accordance with the chart given in Form 2, it will be seen that proprietorship is classified in the two main groups: (1) capital at the beginning of the period, and (2) changes of capital during the period. It is this latter group of accounts which, as they are carried in the ledger, have both right-side and left-side balances. The income accounts, which tend to increase capital and which, when merged with the capital accounts at the beginning of the period, add to that capital, have right-side balances. The accounts which tend to decrease capital, that is, the expense accounts, because they are subtraction items, have left-side balances. The net increase (or decrease) in capital for the period is the excess (or deficit) of the total income accounts over the total expense accounts. The summarized result therefore of current changes in capital added to the capital at the beginning of the period, gives the proprietorship of the business at any given time.

At the beginning of a business enterprise the accounts in the ledger will be an opening balance sheet of the business. Day by day by day as transactions take place, there will be a constant change in the values of the assets, liabilities, and the proprietorship account which will thus express the changing financial condition of the business. Some assets will be increased while others will be decreased; liabilities will also change; and with these changes there will be brought about a change in proprietorship—an increase or a decrease. The ledger must record these changing values as they take place, so that the condition of the business can be determined practically at any time.

The ledger is thus seen to contain and comprise the balance sheet of the business at all times. Certain groupings, summarizations, and adjustments may be necessary before a balance sheet technically correct as to form and content can be taken from the ledger, but the fundamental balance sheet equation is always contained in the ledger. This is pictured graphically in the chart shown in Form 2. A further consideration of the relationships between assets, liabilities, and proprietorship leads us to an explanation of the principles or philosophy of debit and credit, a matter which will be taken up in the next chapter.

CHAPTER X

THE PHILOSOPHY OF DEBIT AND CREDIT

=Double-Entry Bookkeeping.=—Several systems or methods of keeping business records have at various times been in use. The method which at the present time is used by all businesses, excepting those of the simplest sort, is called “double-entry bookkeeping” and is the method which is being set forth here. It is based on the proprietorship equation expressed in the form: Assets = Liabilities + Proprietorship. It is possible to make a balance sheet if only asset and liability records are kept, because proprietorship is always the difference between them. Such a system of record-keeping would fail completely in giving the information as to the current increases and decreases in proprietorship and the causes of such changes. As was indicated in an earlier chapter, such a system would have the disadvantages which the comparative balance sheet has as a means of managing and controlling a business enterprise. The information which is given by the profit and loss records of the business would be entirely lacking.

Double-entry bookkeeping, accordingly, keeps a record not only of assets and liabilities, but also of proprietorship and its constantly changing value. The advantages of such a system were discussed when the need for the information furnished by the profit and loss statement was pointed out (see page 39). Not only does double-entry bookkeeping give this full and complete information, but it ties this information into a system whose mathematical accuracy and correctness can be proved. It is an invention or device whose purpose is definitely to give the desired information and to demonstrate the mathematical correctness of that information.

As already stated, the system of double-entry bookkeeping is based on the proprietorship equation. An equation is an expressed equality. The ledger kept by double-entry bookkeeping always maintains this equality. The sum total of the entries on the left side of all the accounts must equal the sum total of the entries on the right side of the accounts. The way in which the ledger becomes an expanded or detailed balance sheet was explained fully in the previous chapter. There it was shown that the sum of the net balances of all asset accounts, as carried in the ledger as left-side balances, at all times equals the sum of the net balances of the liability and the proprietorship accounts carried in the ledger as right-side balances.

It is evident that, if in place of the net balances of each group of accounts, the gross left- and right-side totals are substituted, the equation would still be maintained, inasmuch as the net balance in each instance is secured by subtracting the same amount, namely, the lesser total, from both sides of the account.

Under double entry, therefore, the equality of the left side of the ledger, that is, the total of the left-side amounts of all of the accounts, is constantly maintained with the right side of the ledger, that is, the total of the right-side amounts of all the accounts. The vertical division of the ledger separating an account into its left and right sides, may with little stretch of the imagination be considered an equality sign, which thus makes one big equation out of all the accounts in the ledger. Under double-entry bookkeeping, therefore, the principles of entry in the ledger are based on no logic or philosophy other than that which attaches to the fundamental proprietorship equation of the balance sheet. Double entry is an invention, a device, and its use requires adherence to the principles of entry necessary to maintain its equation. What these principles are will now be explained.

=The Business Transaction Defined.=—Reference has constantly been made to business transactions. It may be well to show the idea at the bottom of such transactions. We may define a business transaction as an exchange of values. It may be between persons, as when a sale is made, or it may be between accounts within the business itself, as when a transfer is made between accounts, i.e., when an item is taken from one account and transferred to another for the sake of more clearly showing its nature. Some authors further analyze transactions as _complete_ when the bargain is fully consummated between the parties, as when delivery is made and the money is paid in cash; or _incomplete_ as where something still remains to be done by either or both parties to the transaction. In this latter case, claims or rights of action at law arise to protect the parties until the transaction is consummated. But, since from the accounting standpoint a claim or right is one kind of property or asset, there is little need of this finer analysis.

=Analyzing the Transaction as to Its Accounting Record.=—When a transaction occurs in a business, it must first be classified before proper record can be made of it under the account title which groups transactions of a like nature. Its elements must be analyzed, its effect on assets and liabilities, or on expenses and income, must be determined. Has the transaction increased or decreased assets or liabilities, or has it increased or decreased proprietorship, or has it resulted in simply a transfer between accounts—these are the first questions to be determined. The basis of all fundamental classifications is the effect of the transaction upon the balance sheet and profit and loss statements. They are the goal towards which all records look, but the principle which determines the subdivisions in the main classes of accounts and the titles to be given to the accounts which are to be carried in the records, is the amount and kind of information desired by the management throughout the fiscal period. After the transaction has been properly classified, it is merely a matter of recording it according to the standards or forms of good accounting, which is

merely a device for abbreviating the work of recording, i.e., the transaction is translated into correct accounting language.

=The Use of Debit and Credit.=—To show the side of the account affected by a transaction, the words “debit” and “credit” are used, indicating left and right respectively. The use of these words had its origin with transactions between persons and the accounts kept with them. The person owing was charged or debited, while the person to whom the business owed a debt was credited. Through use the terms have come to have the meaning stated first above, though still retaining their original connotation when applied to persons.

=Fundamental Principle of Debit and Credit.=—As stated in Chapter V, every transaction is recorded from two viewpoints, viz., its effect on the assets and liabilities and its effect on the proprietorship or net worth. Sometimes, however, the transaction may require merely a transfer entry, i.e., a transfer of an amount from one account to another without affecting the fundamental classes, as was shown above when defining the transaction as an exchange of values. If it is remembered that from long-continued custom asset accounts are debit accounts, i.e., normally have debit or left-side balances, and liability accounts are credit accounts; that expense accounts are debit and income accounts are credit, the fundamental principles for determining the debit and credit involved in every transaction become pretty well established in one’s mind.

Starting, therefore, with the original investment, whatever form it may have, the transaction is reducible to the fundamental equation:

Assets = Liabilities + Proprietorship

in which “liabilities” may or may not be a “zero” quantity, depending on the nature of the investment. All transactions thereafter must be viewed according to their effects on the three terms of the equation above. We may summarize the effects produced by the various transactions of the business as:

Increase or decrease of assets ” ” ” ” liabilities ” ” ” ” proprietorship

with this qualification: that some transactions result in transfers only without affecting the totals of any of the three groups above, as when an asset is transferred from one account to another for purposes of more accurate classification.

=The Debit and Credit Schedule.=—Bearing in mind the customary distinction between debit and credit, and the fact that entry of a transaction is always made from a double viewpoint—that of cause and effect—every transaction may have its debit and credit determined by the following schedule:

========== _Debit_: | _Credit_: (1) Increase of Assets | (a) Decrease of Assets (2) Decrease of Liabilities | (b) Increase of Liabilities (3) Decrease of Proprietorship | (c) Increase of Proprietorship

=Debit and Credit Determination Illustrated.=—Examples illustrating the various classes of transactions and the manner of determining their debit and credit will now be given. The student should strive to understand the double point of view necessary in determining debit and credit. It is perhaps well to call attention to the fact that the illustrations are entirely unrelated, i.e., do not constitute a sequence of events in any business. It should also be kept in mind that transactions are recorded always from the standpoint of the business whose records are being kept.

1. The purchase of merchandise for cash. The result is an increase of the asset Merchandise caused by the decrease of the asset Cash. Accordingly, the debit and credit of the entry for the transaction are shown by the above schedule under (1) and (a), i.e., debit Merchandise and credit Cash. The transaction is also an illustration of the transfer entry, in which there is no increase or decrease of total assets, liabilities, or proprietorship.

2. The purchase of merchandise on account. This results in an increase of assets caused by the increase of liabilities. The schedule above shows under (1) and (b) a debit to Merchandise and a credit to the personal account payable, indicated by the name of the creditor.

3. The receipt of cash for services performed, as when a broker receives the amount of his commission in cash. The result here is an increase of the asset Cash, caused by the increase of proprietorship, as the performance of services is the chief source of the broker’s income. The schedule shows under (1) and (c) a debit to Cash and a credit to some temporary proprietorship account by name, as Commissions Earned.

4. The payment of a note payable in cash. This results in a decrease of the liability, Notes Payable, caused by the decrease of the asset Cash. Accordingly, debit Notes Payable and credit Cash, (2) and (a).

5. The settlement of a personal account payable by giving a note payable. The effect here is simply a cancellation of one kind of liability with another kind; it is a transfer entry. Debit the personal account payable; credit Notes Payable, (2) and (b).

6. The rendering of a business service to a creditor, thereby canceling an indebtedness to him; as when a physician renders medical aid to his creditor from whom he has purchased supplies. The effect is a decrease in liabilities and an increase in proprietorship. Debit the personal account payable, by name, and credit some temporary proprietorship account, by name, as Fees or Services, (2) and (c).

7. A workman is paid his wages in cash. The result is a decrease in proprietorship and a decrease in the asset Cash. Wages are a cost of doing business and therefore decrease Proprietorship. They are a service rendered to the business instead of by it—an expense as distinguished from an income. Debit the temporary proprietorship account, Wages, and credit Cash, (3) and (a).

8. The account of a lawyer is credited for the amount of his fee. A decrease of proprietorship, for the service rendered the business, and an increase in liabilities. Debit Legal Expense and credit the personal account payable, (3) and (b).

9. Transfer the net gain shown by the Profit and Loss account to the Surplus account. The result is a simple transfer, causing a decrease in proprietorship as shown in the Profit and Loss account and an increase in proprietorship as shown in the Surplus account. Debit Profit and Loss and credit Surplus, (3) and (c).

In a similar manner, all transactions may be analyzed and their entry in the accounts determined.

=Necessary Equilibrium of Debits and Credits.=—Before passing to more detailed rules for debit and credit, the necessary equality of debits and credits should again be pointed out. Starting with the proprietorship equation expressed in this form:

Assets = Liabilities + Proprietorship,

of which the left side is represented in the accounts by debits and the right side by credits, the equality of the debit balances and the credit balances of the accounts in the ledger is readily seen. If, now, for all succeeding transactions an entry is made having an equal debit and credit, evidently the equilibrium of the total debits and credits in the accounts is maintained and the two sides of the ledger are in agreement. The making of an equal debit and credit for every entry is fundamental and must be strictly observed.

CHAPTER XI

DEBIT AND CREDIT AS APPLIED TO ASSET AND LIABILITY ACCOUNTS

=Student's Use of Working Rules.=—In order to indicate the more usual types of transactions which affect the asset, liability, and proprietorship accounts, a set-up of the various groups of accounts will be given, under which will be shown transactions recorded as debits and those recorded as credits. Accounts will be shown in the order in which they appear in the balance sheet. The accounts under each group will, of course, bear their own individual titles and not the title of the group. Only such entries as are more frequently met with will be given. Since in the group accounts given as guides only those entries appear which affect these group accounts, it is deemed impracticable to attempt to show the contra, or other side of each entry arising out of the transactions. However, the student should always supply mentally the contra of each entry shown in the group reference account. For the sake of clarity, the personal pronouns "we" and "us" will be used instead of the impersonal name.

=Accounts with Cash and Notes Receivable.=—Entries to the Cash and Notes Receivable accounts are comparatively simple and are shown in the following schedule:

(NAME OF ACCOUNT) ========== _Debit_: | _Credit_: (1) For all receipts | (a) For all disbursements or incoming items. | or outgoing items.

Transactions with cash are self-explanatory.

The accounts representing transactions with notes require some explanation. When, in the course of business, we receive a note, Notes Receivable is debited and the person who gives it is credited, because our asset Notes Receivable is increased and the claim against the open account of the person giving the note is decreased. Similarly, when that note is disbursed by us, i.e., goes

out of our possession, the asset is diminished and therefore Notes Receivable is credited.

A note receivable can be disposed of in several ways:

1. Through its release on payment by the maker, 2. Through its transfer by us to another person in settlement of a claim against us, or 3. Through its sale to the bank.

In all of these cases the credit goes to Notes Receivable. In cases 1 and 3, the asset increased, viz., Cash, is debited; and in case 2 the liability canceled or decreased is debited. It may be stated, however, that in cases 2 and 3, instead of making the credit direct to the asset account Notes Receivable, it is better carried to a supplementary account, Notes Receivable Discounted, in order to show the liability arising from the fact that, through our indorsement, we guarantee to pay the note at its maturity in case the maker fails to do so. This is later explained in detail.

Accounts with Customers

(NAME OF CUSTOMER) ========== _Debit_: | _Credit_: (1) For amount he owes us | (a) For money he pays us on account. at beginning. | (b) For notes he gives us on account. (2) For goods we sell him | (c) For goods he returns to us. on account. | (d) For discounts we give him. | (e) For claims we allow him.

The balance owing us by a customer is an asset, and therefore a debit item.

Goods sold on account are charged to the customer because our claim against him constitutes an asset; at the same time the income account, Sales, is credited.

When a customer pays us on account, his account is credited and Cash is debited, showing an increase of the asset Cash and a decrease of the asset Accounts Receivable. Such an entry is simply a transfer from one account to another, an increase of one asset offset by a decrease of another asset.

When a customer gives us his note, his account is credited and Notes Receivable is debited, usually, with the face of the note.

When a customer returns goods to us, he is credited to decrease the original charge to his account and Sales or Returned Sales is debited to reduce the income originally credited to Sales. It is not necessary to make any other record of the returned goods, because, as was explained in Chapter VI, no day-to-day record is kept to show the decrease of the asset Merchandise through Sales. So, when goods are returned by a customer, the increase of the asset Merchandise will be shown at the end of the fiscal period when the merchandise inventory is taken, and no other record than that indicated is necessary.

When a customer is allowed a discount for the early payment of his bill, he is credited to reduce the original charge by the amount of the discount, and some temporary proprietorship account, as Discount on Sales, is debited to show the decrease in proprietorship resulting from the allowance of the discount.

When a customer is allowed a claim for reduction in his bill on account of damaged goods or the like, the entry is similar to the one next above—debit Claims and Allowances and credit the customer.

The Merchandise Account

MERCHANDISE ========== _Debit_: | _Credit_: (1) For merchandise on hand at the | (a) For sales of merchandise. beginning. | (b) For returns of merchandise (2) For purchases of merchandise. | purchased. (3) For all costs necessary to | bring the merchandise from | its place of purchase to its | place of sale. | (4) For goods returned by customers.|

Entries in the Merchandise account require no explanation excepting the debit entry (3). The value of the asset Merchandise is not the price paid for it at the point where purchased, for it is of no value to the business until it is placed on the shelves ready for sale. Accordingly, the value of the asset Merchandise is not determined merely by the price paid the vendor, but by this price plus all of the costs necessary to bring the merchandise to the store. Inasmuch as the merchandise is sold normally for more than it cost, the credit entry in the Merchandise account includes two items: (1) the decrease of the asset, as indicated by the cost price of the goods sold; and (2) the amount of profit on the sale, that is, the amount of the increase in proprietorship.

The record of merchandise transactions is thus seen to be rather complex and will be explained fully in Chapter XIII. The above schedule is simply an indication of the types of transactions recorded in the Merchandise account and will be sufficient for the present. It will be seen that the sale of goods results in a debit to the customer's account and a credit to Merchandise.

=Accounts with Fixed Assets.=—Accounts with fixed assets are those with land, buildings, and equipment of all sorts.

(NAME OF ACCOUNT) ========== _Debit_: | _Credit_: (1) For full cost to the business | (a) For sale or loss, in position ready for use. | at cost price.

The debit to this account is not for invoice or first cost only, but should include all expenditures necessary to secure full title or to place the equipment in position for use by the business, such as abstract of title costs, freight, drayage, and, in the case of machinery, setting-up and placement costs. The corresponding credit is usually to Cash, or to Notes or Accounts Payable.

The account is credited for the sale of all or a portion of the asset at the same price at which it was originally charged, so that the balance in the account shows the pro rata cost of the part left. A loss from fire or otherwise is treated similarly. If the asset is sold at a profit (an unlikely occurrence), the account is credited with its cost price, while the excess of the sale price over the cost price is credited to a proprietorship account, such as Profit on Sale of Machinery. The debit corresponding to these two credits is usually to Cash or some other asset received in payment. Where the asset is sold at a loss, the account is credited with: (1) the sum received, and (2) the difference between this sum and the cost of the asset, which difference represents a loss. The loss or deficiency is debited to a proprietorship account, such as Loss on Sale of Machinery, and the additional debit is to Cash or some other asset received. This latter debit amount plus the debit to Loss on Sale of Machinery must, of course, equal the two amounts credited to the fixed asset account and representing the cost of the asset sold.

Fixed asset accounts are further considered in Chapter XIII, where the manner of recording loss through depreciation is shown.

=Accounts with Notes Payable.=—When we issue our own note, the credit is to Notes Payable and the debit is either to the liability account reduced or to the asset account increased. When we call the note in, either by paying it or by canceling our claim against the person returning the note, Notes Payable is debited and Cash or the person returning the note is credited.

Accounts Payable

(NAME OF CREDITOR) ========== _Debit_: | _Credit_: (1) For money we pay him on account. | (a) For amount we owe him (2) For notes we give him on account. | at beginning. (3) For goods we return to him. | (b) For goods he sells us (4) For discounts he gives us. | on account. (5) For claims he allows us. |

As will be noted by reference to the customer's account, the entries to the creditor's account, being viewed from the opposite standpoint, are exactly the reverse of the entries to the customer's account.

=Other Liability Accounts.=—Accounts with other liabilities, such as Mortgages, Bonds, Expenses Payable, and the like, follow in the main the general principles laid down (pages 81 to 83). Specific treatment will be given them as they are met in the discussion. In the case of long-time notes payable supported by mortgages, record should be made under the title "Mortgages Payable" rather than "Notes Payable."

CHAPTER XII

DEBIT AND CREDIT AS APPLIED TO PROPRIETORSHIP ACCOUNTS

=Proprietorship Accounts Defined.=—Proprietorship accounts are the accounts which record the effects, both temporary and ultimate, of business transactions upon proprietorship. The study of the two preceding chapters has made clear the fact that transactions which involve the receipt of income or the payment of expenses result respectively in an increase or decrease of proprietorship, and that these increases or decreases are temporarily recorded in suitable income and expense accounts until the close of the fiscal period, at which time the accounts are summarized to determine the net effect of all transactions upon proprietorship or the capital invested in the business. Therefore, the proprietorship accounts are of two general kinds: temporary and vested. Temporary proprietorship accounts make temporary and immediate record of the results of the agencies or forces at work within the business to produce a profit. They set forth the efforts to increase the net worth of the business. They record the costs of the effort and its yield in earnings, the record being made under appropriate titles to show the kind of cost and the source of the yield. Vested proprietorship accounts record the ultimate or summarized results of business transactions. They therefore record

the original investment and its subsequent net increases and decreases.

=Fundamental Consideration of Proprietorship Debits and Credits.=—Income and expenses comprise the temporary proprietorship items which, after being summarized, show their ultimate effect upon vested proprietorship. In other words, they are proprietorship items set up temporarily to furnish detailed information for aiding in efficient management and control and are later transferred to the ultimate or vested proprietorship records. Since, from the mathematical necessity of the proprietorship equation, proprietorship items normally have credit balances, it is evident that all income, or earnings, must be placed on the credit side of their appropriate accounts. Cost of management and all expenses of operation are deductions from that income and must therefore be recorded on the left or debit side of appropriately named accounts.

=Income Debits and Credits.=—With regard to their debits and credits, income accounts follow this rule:

INCOME (under appropriate titles) ========== _Debit_: | _Credit_: (1) For all deductions from the | (a) For the yield. yield shown contra. |

Income accounts normally have entries only on the credit side. They are debited, however, for the purpose of deducting from the yield shown on the credit side, (1) because of overstatement of the amount of the yield in the first place; (2) because of error in the original placing of the item of income, which is now transferred to its proper account; and (3) for the purpose of summarizing when it becomes necessary to transfer all income and expense items to one summary account. The entries made for the purposes of transfer and summarization are sometimes called “adjusting” and “closing” entries.

=Expense Debits and Credits.=—With regard to their debit and credit, expense accounts follow this rule:

EXPENSE (under appropriate titles) ========== _Debit_: | _Credit_: (1) For the cost. | (a) For all deductions from the cost, | shown contra.

Expense accounts normally have entries only on the debit side. Their credits are for purposes similar to the debits to income accounts as stated just above.

Examples of temporary proprietorship items can be found in Chapters V, VI, and VII, where the profit and loss summary is treated.

=Vested Proprietorship Debits and Credits.=—Two accounts should be kept on the ledger with the proprietor, a capital and a personal account, i.e., “John Doe, Capital” and “John Doe, Personal.” The capital account records the original investment or the amount of capital now in the business as shown by the last financial statement. The personal account shows all direct changes made in the capital during the fiscal period either through withdrawal or the additional investment of funds or properties. The capital account, therefore, shows no change until the close of the fiscal period, when the increase or decrease in net worth is transferred to it.

An exception to this is sometimes made when there is evident intention to withdraw during the period some of the invested capital, in which case such withdrawal is shown in the capital account as a debit or subtraction item. Also, if there is evident intention to increase the investment during the fiscal period, record of it is sometimes made in the capital account. Practice in this regard is not uniform.

The ordinary transactions with the proprietor, such as more or less regular withdrawals of cash or goods and other similar transactions, are recorded in his personal account. This is his current account as distinguished from his more permanent capital account. Both of these accounts may be termed vested proprietorship accounts. Their debit and credit schedule appears as follows:

(NAME OF ACCOUNT) ========== _Debit_: | _Credit_: (1) For amounts or values | (a) For amounts or values withdrawn. | invested.

The capital account usually shows only one item throughout the period until its close; the personal account shows both debits and credits, made according to the above schedule. The personal account ordinarily shows transactions of the following kind: on the debit side, withdrawals in funds or goods, the payment or assumption by the business of the personal debts of the proprietor, and his retention of any funds or properties belonging to the business, such as collections from customers; on the credit side, the investment in the business of any funds or properties, the retention by the business of any funds or properties belonging to the proprietor, as where the business collects and retains a debt due him personally, and the payment or assumption by him personally

of any debts of the business.

=Further Consideration of Expense Items.=—In explaining the debits to fixed asset accounts it was pointed out that all costs necessary to place the asset in position for use by the business constituted a part of the value of the asset and should be recorded in the asset account. Similarly, it was explained that in the Merchandise account there was included as a part of the value of the merchandise all the costs incident to putting the merchandise in position for sale by the business. Costs of this kind are classed as incoming costs and are almost without exception treated as additions to the value of the asset. The costs incurred from this point on, in the course of business operations, are classed as expenses or proprietorship decreases.

It might sometimes appear that all these operating costs—the kind shown in the profit and loss statement—also add to the value of the assets of the business. Such is not the case. In a mercantile concern, business is conducted for the purpose of selling merchandise. Profit arises through the purchase of merchandise at one price and its sale at a price sufficiently higher to pay for all operating expenses and leave a margin. The cost of merchandise to the customer reimburses the proprietor for his original outlay in merchandise and for a fair portion of the operating expenses incident to the maintenance of the store. The customer is willing to pay this additional amount because it is cheaper for him to pay the merchant a margin over the cost of the merchandise sufficient to induce the merchant to conduct a market for merchandise, than to undergo the necessary expenditures—of time, expense, and inconvenience—entailed in making the purchase from the original vendor.

The economic organization of business is based on this hypothesis. In the management of a business there is a very large element of risk. The sale price of commodities at a given time is not always determined on the basis of the original cost of the commodity plus the costs of maintaining a store for its sale. Competition sometimes enters in to drive the price down below this amount. While every merchant _expects_ in the long run to receive from the sale of his merchandise not only what he himself has paid for it but also the cost of conducting his store and a fair margin of profit, for a given period and for a given item of merchandise he may not be so fortunate.

In recording business transactions, therefore, prudence demands that the costs of operating the business be not recorded as increases in the value of the merchandise dealt in, but rather that they be set up separately and charged against the income received from the sale of the merchandise before the increase (or decrease) in the value of the assets is determined and made a part of the asset record. As merchandise is converted into cash the amount received is recorded as an increase in the asset cash. This cash includes the original cost of the merchandise plus some of the costs of operating the business. These are costs which must be incurred and they add value to the business as indicated by the willingness of the customer to pay the merchant for them. Because the added value is problematical at the time the costs are incurred, they are recorded as expenditures which must be made good out of the sale of the merchandise at a sufficiently enhanced price to cover them, i.e., they are _expenses_ which are to be treated as deductions from sales income.

The net difference between the income and the cost of securing the income, as indicated by the expense accounts, will represent the value added to the assets of the business, and will therefore be reflected tangibly in an increase in the value of the assets by that amount. This increase will usually be reflected either in the cash holdings or in claims against customers.

It may not be out of place at this point to call attention to the fact that, as the bookkeeping record is usually handled, the only relationship between asset increases, liability decreases, and expenses (proprietorship decreases) arises from the fact that all of them are debits and are so placed because of the mathematics of the fundamental equation on which double entry rests. Assets, liabilities, and proprietorship are three distinct and separate groups of accounts related only by the logic of the proprietorship equation. As the subject of accounting is developed the student will see the increasing importance of drawing sharply the lines of division among these groups and he will see also the difficulty at times of maintaining this distinction.

CHAPTER XIII

DEBIT AND CREDIT AS APPLIED TO MIXED ACCOUNTS

=Mixed Accounts Defined.=—In the course of business operations certain accounts which at the beginning of the period belong definitely to some one of the three groups, asset, liability, and proprietorship, with the progress of the period take on a mixed character. That is, included under one account title there is a mixed record of asset and expense, or other combination of two or more groups. For example, the machinery which belongs to the asset group at the beginning of the period depreciates in value day by day, both through use and the lapse of time. This daily decrease in value is of slight amount and in the management of the

business it is not necessary that it be shown on the books. While it is theoretically possible to record this daily loss, practically nothing would be gained by so doing. Hence, the machinery account is allowed to carry both the asset value of the machinery at a given time and the amount of its depreciation. Only periodically, usually at the close of each fiscal period, is the account separated into its two parts, the one which shows the true asset value and the other which indicates the amount of depreciation and which is therefore the expense or proprietorship-decrease portion of the account.

In the previous chapter the way in which the Merchandise account takes on a mixed character was briefly explained. It was shown that the credit side reflected both a decrease of the asset and an increase of the proprietorship by the amount of the gross profit on the goods sold. Thus, because of the way in which accounts are kept practically, as distinguished from a theoretically correct method, which would maintain at all times a sharp line of division between assets, liabilities, and proprietorship, certain accounts are allowed to become mixed. It is the purpose of this chapter to discuss the proper handling of the more common mixed accounts.

=Analysis of a Sale Transaction.=—The impracticability of immediately separating each sale of goods into its two elements of cost and profit and the taking of a physical inventory as a means to this end, was discussed in Chapter VI. The necessity for this later separation may be made clear by analyzing a sale transaction.

Suppose an article costing $10 is sold for $12. At the time of its purchase a debit was made to Merchandise account and a credit, say, to Cash. When the article is sold, it would seem that the credit should be to Merchandise to show the decrease in that asset. However, in the sale price of $12 is included something more than the amount by which the stock of merchandise is decreased. This additional amount is the profit of $2. Hence, a credit to Merchandise of $12 would result in too large a subtraction from the asset Merchandise, if it is intended that the Merchandise account shall always show by its balance the value of the unsold stock. Theoretically the best method of entering this sale would be to debit Cash for $12, and to credit Merchandise with $10 and Profit with $2.

=The Old Merchandise Account, Its Content and Significance.=—It is impracticable, however, to compute and record the cost of every unit sold. Using the above illustration, instead of crediting Merchandise with $10 and Profit with $2, the entire $12 may be credited to the Merchandise account. There is a disadvantage in this procedure, in that the Merchandise account then no longer represents the one asset Merchandise, but is a mixture of an asset element, merchandise, and a proprietorship element, profit; two elements which must be separated at the close of the period.

Originally, the Merchandise account was kept in this way; it was a _mixed_ account and followed the rules of debit and credit as shown below, the amounts being given for purposes of illustration:

(A) MERCHANDISE ========== _Debit_: | _Credit_: (1) For goods on hand | (a) For sales 25,000.00 at beginning 10,000.00 | (b) For returned (2) For purchases, | purchases 2,000.00 sometimes including | (c) For purchases freight-in, | rebates and drayage-in, | allowances 100.00 etc. 20,000.00 | (3) For returned sales 1,000.00 | (4) For sales rebates | and allowances 500.00 |

Where the account is kept in this manner it is usually burdened with the additional data listed under (3), (4), (b), and (c). Sales being a credit item, it is plain that subtractions from sales (3) and (4), must appear on the debit side, and, purchases being a debit item, subtractions from purchases (b) and (c) must appear on the credit side. If these subtractions were actually performed instead of being indicated in the account, the debit side would show net goods to be accounted for, viz., goods on hand at the beginning, $10,000, plus _net_ purchases, $17,900, making a total of $27,900; and the credit side would show _net_ sales, $25,000 minus $1,500, or $23,500.

If, now, the cost value of the goods on hand at the close of the period (as determined by a physical inventory) equals $8,000, it is evident that the cost price of the goods sold is equal to the cost value of the goods to be accounted for, minus the cost value of the goods left on hand, that is, $27,900 minus $8,000, or $19,900. To secure this subtraction within the account, it is necessary to enter on the credit side this $8,000, the cost value of the final inventory. Accordingly, an additional credit item (d) is inserted, after which the account will show:

(B) MERCHANDISE ========== _Debit_: | _Credit_: (1) For goods on hand | (a) For sales 25,000.00 at beginning 10,000.00 | (b) For returned (2) For purchases, | purchases 2,000.00 sometimes including | (c) For purchases freight-in, | rebates and drayage-in, | allowances 100.00 etc. 20,000.00 | (d) For goods on hand (3) For returned sales 1,000.00 | at end 8,000.00 (4) For sales rebates | and allowances 500.00 |

The account is now a pure proprietorship account, the balance showing the gross profit on sales, amounting to $3,600.

=Modern Practice in Showing Merchandising Transactions.=—Actual subtraction, however, within the account is contrary to the method of showing subtractions in the account. Therefore, the mixed Merchandise account cannot show the figures representing “net purchases,” “net sales,” “total goods to be accounted for,” and “cost of goods sold”—information which is very essential to proper management. While containing all the data necessary to give the final information, viz., the “gross profit,” the mixed account does not show the separate factors leading up to it. Analysis of the mixed account is necessary to find the elements of which it is composed. The best accounting practice provides for this analysis as the transaction takes place. The old Merchandise account is no longer used; in its place separate accounts are set up to represent the various elements mentioned above. Each account thus contains only one kind of item as indicated by its title. These accounts are:

(1) MERCHANDISE INVENTORY ========== | | |

(2) PURCHASES ========== | | |

(3) INWARD FREIGHT AND DRAYAGE ========== | | |

(4) RETURNED PURCHASES ========== | | |

(5) PURCHASES REBATES AND ALLOWANCES
========== | | |

(6) SALES ========== | | |

(7) RETURNED SALES ========== | | |

(8) SALES REBATES AND ALLOWANCES ==========
| | |

Accounts (1), (2), (3), (7), and (8) correspond to the four classes of debits shown above in the mixed Merchandise account, and accounts (1), (4), (5), and (6) correspond to the credits. Explanation of the use of account (1) for both the initial and final inventories is given in detail in Chapter XV.

The advantage of the use of these accounts instead of the one Merchandise account is in the availability of the information they contain and in the saving of labor, because now there is no need to analyze the Merchandise account for information relating to returns, allowances, and so forth. By later transferring the totals of the Returned Sales and of the Sales Rebates and Allowances to the Sales account, the balance of this account will show the “net sales.” A similar transfer of the Inward Freight and Drayage, the Returned Purchases, and the Purchases Rebates and Allowances to the Purchases account, and a transfer to it of the initial and final inventories, make it show by its balance the “cost of goods sold” which set over against “net sales” shows the figure of “gross profit.”

The student will understand that the use of these detailed accounts does not free the record of merchandise transactions from the mixture of different elements, decrease of the asset and increase of the profits. It does, however, make the record more valuable because of the information it makes available.

=Accounts with Assets Subject to Depreciation.=—Another kind of mixed account requiring explanation is that of the fixed asset subject to depreciation. Due to ordinary wear and tear, and some other causes, most fixed assets lose part of their value as time goes by. At the end of each fiscal period the amount of this loss and the present value of the asset must be estimated, after an inventory has been taken, when necessary, of their number, weight, or other units of measurement. Such an estimate is called an appraisal. The difference between the present appraised value of the asset and its former cost or appraised value constitutes the loss from wear or other causes, and is termed depreciation.

Since depreciation takes place day by day, but for practical reasons cannot be recorded daily, fixed asset accounts, as they stand valued in the ledger, represent true asset values only for the date of their entry. Except on that date, these accounts, then, include depreciation and hence are mixed accounts including both asset and proprietorship elements. As with the Merchandise account, an adjustment is made periodically to separate the two elements. Since the asset account is a debit account, entry of the amount of the depreciation to the credit side would result in the account showing, by its balance, the appraised value of the asset at any given time. It is, however, desirable to leave the account in its original condition, in order not to lose sight of the cost of the asset.

Therefore the usual practice is to enter this figure of depreciation to the credit side of a separate account called Depreciation Reserve for the particular asset, using the word “reserve” in the sense of “estimate.”

If the latter method is followed, each asset has two accounts, one showing original cost and the other estimated depreciation, and it is necessary for a true valuation of the asset to read the two accounts together; that is, from the asset account showing original cost, the amount credited to the reserve account must be deducted to show the true value of the asset. Because of this, the reserve account is often called a valuation account or an offset account, as it gives the amount of the offset to the original asset account necessary to show its correct value. Similarly, when an increment in the value of an asset is kept separate from its face or par value—as when the premium paid for stock or bonds is shown separately from the par value of the stock or bonds—the account showing the increment is called an adjunct account and must be read with the asset account to secure true valuation. The offset account, then, is a subtraction item and the adjunct an addition item to the corresponding asset account. The showing of the asset and its periodic valuation is made as follows:

MACHINERY ========== 1921 | Jan. 1 5,000.00 |

DEPRECIATION RESERVE MACHINERY ========== | 1921 | Dec. 31 500.00 | | 1922 | Dec. 31 500.00

A reading of the two accounts taken together shows the original value of machinery as $5,000, the value after one year’s use $4,500 and after two year’s use $4,000. The contra debit for the credit in the reserve account is made to an account called Depreciation, which represents the expense of the depreciation for the period, that is, the deduction from profit or proprietorship. Sometimes, this charge is made direct to Profit and Loss, as will be shown in a later chapter.

=Capital and Revenue Expenditures.=—The fixed asset accounts usually show the investment of some of the original capital and therefore are sometimes called capital asset accounts. A fundamental distinction must be made between expenditures for the purchase and installation of the asset itself and expenditures for expenses in connection with its repairs, maintenance, and upkeep. These two classes of expenditures are usually called “capital expenditures” and “revenue expenditures” respectively.

The asset account itself is chargeable with all costs incurred up to the point of putting the asset in shape for use in the business. It may be charged also with subsequent expenditures resulting in an increase in its value. Expenditures, however, which are for the purpose of repairs or of keeping the property from too rapid depreciation without adding anything to its original value, must be charged to a properly labeled _expense_ account. These revenue expenditures for expenses, such as repairs, maintenance, upkeep, together with depreciation, are subtractions from profit and proprietorship, while asset expenditures usually constitute an exchange of the asset cash for some other asset, which exchange has no effect on proprietorship.

Sometimes two items of expenditure are seemingly of the same nature, while in fact they belong to separate groups, as the original painting cost of a building and the cost incurred later for repainting. In the first instance the expenditure is an asset, a part of the original cost necessary to put the building in a finished condition; in the other instance, it is an expense necessary to maintain the asset in something near its original condition. In order to secure accuracy in the records, careful discrimination between capital and revenue expenditures is a matter of great importance.

CHAPTER XIV

PERIODIC WORK ON THE LEDGER

The work preliminary to summarizing the record of transactions for a period and preparing the balance sheet and profit and loss statement is comprised under three heads: (1) the Trial Balance, (2) Adjusting Entries, and (3) Closing Entries. These three steps will be discussed at this point sufficiently for practice work in closing the ledger. Fuller treatment of the subject is reserved for later chapters, after the nature of the transactions that may complicate the closing of the ledger have been explained.

=The Trial Balance.=—When all transactions for the fiscal period have been entered on the ledger, it is desirable to make sure that the ledger is in equilibrium, i.e., to make sure that for every entry on the debit side there is an equal credit entry, and that for every credit entry there is an equal debit entry; in other words, that the ledger equation explained in Chapters IX and X is maintained. This proof of the mathematical correctness of the ledger is accomplished by means of a device called the “Trial Balance,” which consists of a debit and credit list of either all account totals or of all account balances. If the total debits equal the total credits, the mathematical equilibrium is demonstrated. A trial balance is usually set up somewhat as follows:

TRIAL BALANCE, June 30, 19—

Dr. Cr. Cash $ 1,000.00 Notes Receivable 1,500.00 A. B. Casey 500.00 B. C. Darby 450.00 C. D. Ebbets 200.00 D. E. Field 300.00 E. F. Gall 150.00 F. G. Hiller 350.00 Merchandise Inventory 4,000.00 Store Equipment 500.00 Depreciation Reserve Store Equipment $ 75.00 Notes Payable 1,000.00 Hill & Innes 350.00 Jones & Kanter 175.00 Lunt & Mason 200.00 Noble & Oberly 150.00 P. I. Richards, Capital 5,000.00 P. I. Richards, Personal 1,000.00 Sales 20,000.00 Purchases 12,000.00 Salaries 2,500.00 Insurance 500.00 General Expenses 2,000.00 ---------- ---------- $26,950.00 $26,950.00 ========== ==========

=Work Preliminary to the Trial Balance.=—Before taking a trial balance, the accounts should be totaled on each side. These totals are shown in small but legible pencil figures immediately beneath the last entry, sufficient space being left for a regular entry on the line immediately below the pencil footing. Reference to the illustration in Form 3 makes this bookkeeping detail clear. The difference between the totals of the account should now be shown in pencil in the explanation column on the side of the larger amount. Taking the trial balance thus becomes merely a transcription of pencil balances, debit or credit as the case may be, from the list of accounts.

=Balancing an Account.=—Sometimes it is desirable, as in the Cash account, to show on the face of the account the difference between the total debits and credits, i.e., the balance of the account. This may be accomplished by writing the balance on the side with the smaller total, and by formally ruling up the account and entering in ink the totals on both sides, which totals, of course, are now equal. It should be noted that the total rules in the money columns are drawn on the same line on both sides of the account, thus leaving several blank lines on the debit side. This is done so that the entries in the new section of the account will start on the same line for both debits and credits. On the next line below the double ruling, the balance item is brought down to its proper side. The account is now said to have been closed as to all items above the rulings and shows its open balance in the one item beneath the rulings. The method of balancing and ruling accounts is illustrated in the Cash account shown in Form 3.

It is important to bear in mind that the closing balance of the account is on the side showing the smaller _pencil_ total, whereas the opening balance which appears beneath the ruling is on the opposite side. The only purpose of the entry on the smaller side is to force an equality of the two sides, thus formally closing all entries to that point and showing the “balance” as a single item in the new portion of the account.

It should be noticed that this “balance” entry does not disturb the equilibrium of the books, because it is entered on both the debit and credit sides of the same account.

=Use of Red Ink.=—The total and closing rulings and the balancing entry are sometimes made in red ink, but black ink is preferable. The use of red ink is usually reserved for recording subtraction items in the same column with those from which the subtraction is to be made. Where red ink is so used, the total of the “red” is subtracted from the total of the “black” amounts and the net result is shown in the total of the column. When there are only a few “red” items, this method of recording obviates the use of a separate column for them. Such red ink entries are not found in the standard ledger, being confined to special ledgers and columnar statements of various kinds.

[Illustration: Form 3. Account Balanced and Ruled]

=Rulings.=—The single lines above the totals, indicating the addition, extend only through the money columns and are on the same line on both debit and credit sides. The closing rulings beneath the footings are double and extend through the date columns, the money columns, and the posting reference columns. The diagonal line on the debit side from the total line to the date column for the last entry is for the purpose of filling all blank lines, and preventing any further entries on them after the account is formally closed, as such entries would have the effect of falsifying the totals shown. Thus the diagonal line which may be on either debit or credit side serves as a safeguard against fraud. Diagonal rulings, however, are not used so extensively as formerly.

=Transferring.=—When for any reason it is desirable to transfer an account from one page to another, the transfer is made by means of an entry similar to the “balance” entry shown in the Cash account above. Instead of the word “Balance,” the word “Transfer” or “Forward” is used, and in the column between the explanation and money columns is entered the number of the page to which the transfer is made. On that page the account name appears, and the first entry is the amount transferred from the old account, with a page reference to the old account in the reference column. In making the transfer it is customary to close the portion of the account on the old page in the manner explained above, and to transfer only the balance.

Sometimes an entry may be made in an account in error and for this or some other reason may need to be transferred. Assuming, for the purpose of illustration, that such an entry is a credit, its amount is first written as a subtraction item on the debit side in the old account, with proper reference to the page to which it goes. On the new page it appears on the credit side, like the original item, and may be considered as the contra to its transfer record in the old account. In the new account the old page number must be entered. Great care should be exercised in all transfer entries to show correct cross-indexing.

Sometimes it is desired to transfer not the balance but the total debits and credits of an account. In this case the total debit amount may be entered on the credit side of the old account and the total credit amount on the debit side, with proper page and explanatory references. This forces the equality of the two sides and the account may now be totaled and ruled off. The total debit amount of the old account is then entered on the debit side and the total credit amount on the credit side of the new account.

A much simpler and more workable method, however, is to treat the new account as a continuation of the old. There is then no necessity of formally balancing the old account. The transfer is effected by totaling both sides of the old account and indicating the new page to which these totals are transferred, taking care to enter the totals on the proper side of the new account, with proper references to the old account page. This procedure is illustrated in Form 4.

=Rulings and Entries in Personal and Note Accounts.=—Some peculiarities met with in the entries and rulings of personal and note accounts, both receivable and payable, will be discussed here.

In John Adams' personal account (Form 5) notice that his address is included in the heading, that the terms of credit extended to him on each sale are shown in the explanation space on the debit side, and that his payments are entered on the credit side according to the date on which they are received. If a payment appears directly opposite the corresponding charge, with no other credits intervening, lines are ruled underneath both the debit and the credit items to show that down to that point the account balances. The record of dealings with each customer should be as full as possible in order to furnish an accurate basis for credit rating. If he is prompt in his payments, taking advantage of the discounts offered him, the account should show this.

[Illustration: Form 4. Transfer of Account to New Page]

[Illustration: Form 5. Personal and Notes Payable Accounts]

A convenient method of showing clearly the taking of discounts, without the need of calculating the time between dates of charge and payment, is to enter the discount in small ink figures above the net amount received. When two partial payments are made, as on October 1 and 15, to settle the charge of September 20, and there are no other credits intervening, the two credits, with the total in small figures, may be ruled off against the single charge. At the time the trial balance is taken—in the illustration on August 31, September 30, and October 31—the balance of the account is calculated and shown in pencil on its proper side, debit or credit, just to the left of the reference column on the line of the last entry on that side.

Sometimes, when payments are made out of order or on account and it is desired to show to what particular charges they apply, an index number or letter showing the cross-reference is used, as shown in the Notes Payable account. As notes are issued by the business, they may be numbered, and when it pays a particular note, the entry should show the number of that note.

These remarks apply also to notes receivable. If full payment is received on each note as it comes due, the entry may be made on the same line on which the note was first recorded. This may result in the entries to the account appearing out of chronological order, but it assists in an easy determination of the outstanding notes. Numbering, or preferably lettering, the entries in an account may be applied with advantage also to the entries in personal accounts, as it aids in locating unpaid items, especially where payments cannot be recorded in the order in which the items to be settled have been entered.

The method of ruling and thus canceling items as explained above, is usually limited to notes and accounts receivable and payable, that is, to the accounts on which particular payments are received or made and the balance of which it is desirable to ascertain at frequent intervals. On the other hand, it is advisable that the method of showing periodic balances, by means of small pencil figures for use in the trial balance, be applied to all accounts.

CHAPTER XV

PERIODIC ADJUSTMENTS AND SUMMARIZATION

=Why Current Records of the Ledger Need Adjustment.=—At the end of the fiscal period the ledger does not present a true record of financial condition. The fixed assets of the business are constantly depreciating in value; merchandise tends to become out of date, shopworn, stale, or soiled; some merchandise has been sold, while some is still on hand; some of the accounts receivable may prove uncollectible, and some of the notes receivable may be dishonored. Also, at the end of the period liabilities such as taxes, salaries, rent, and the like may have been incurred, but because there is no creditor's invoice or other business paper as evidence of such liability they are not usually entered on the books until payment is made.

Again, it may be that the services paid for during this period, as shown by the various expense accounts, have not been entirely used, as where a supply of coal for heating purposes remains on hand, or when, as in the case of insurance bought for a given period of time, a part of the protection period extends beyond the close of the current fiscal period. In these and similar cases, the items must be separated into their two component elements, one part belonging to the current period, and the other part to a later period. The part of the expense to be deferred and used up in a later period represents an asset at the close of the current period and must therefore appear on the balance sheet under the heading of "Deferred Charges."

Similarly, income is sometimes received in advance to cover services which have not yet been rendered, or rendered only in part, as when rent is received in advance to cover a given number of months, some of which belong to the next fiscal period. Consequently, only a part of this income applies to the current period, the balance being deferred to later periods.

For these reasons certain asset accounts need to be adjusted and certain liability accounts must be opened to bring the ledger into accord with the actual condition of things and show the true financial status of the business. The entries required for this purpose are called "adjustment entries" to distinguish them from the closing or summarizing entries to be described later in this chapter.

First in importance among the adjusting entries are those required to show the correct value of the stock-in-trade, the fixed assets, and the accounts receivable. Whether the merchandise items are kept in one or several accounts, the value of the stock on hand is not shown at any given time during the fiscal period. Goods have been purchased at one price and sold at another, and no record of the value of the merchandise inventory on hand is available. Similarly, no current record has been made of the depreciation of buildings, furniture, fixtures, or other equipment, nor has any provision been made for the accounts receivable that may prove uncollectible.

=Basis of Adjustment Entries.=—These items, then, merchandise, asset depreciation, bad debts, prepaid and accrued expenses and income, are the occasion of the adjustment entries. An inventory is required to find the value of the stock-in-trade; an appraisal is made of the depreciating assets to determine the amount of depreciation for the current period; and proper consideration must be given to the prepaid and accrued income and expense items for the period under review. The following illustrations are concerned with the several classes of adjustment entries. The detail of the account is not shown in each case, but only the balance.

=Adjusting and Closing the Merchandise Records.=—Unlike the method shown in the debit and credit schedule for merchandise in Chapter XIII, the modern practice is to keep the merchandise record by means of the separate accounts used in the profit and loss statement, viz., Merchandise Inventory, Purchases, Inward Freight and Cartage, Returned Purchases, Purchases Rebates and Allowances, Sales, Returned Sales, and Sales Rebates and Allowances. It should be understood that this detailed record of merchandise transactions is preferable to the single merchandise account only because it gives more information. The detailed record does not in any way maintain a sharper separation of the asset and income elements of the merchandise transactions than does the single merchandise account. It does, however, make immediately available information as to volume of business, purchases, returns, and so forth—items which in any well-managed business are watched carefully. These detailed accounts taken together comprise the merchandise record and are equivalent to the single merchandise account.

It is apparent from a consideration of the single merchandise account that at any given time it includes these three items: (1) the net cost of the total goods to be accounted for; (2) the decrease in the asset merchandise brought about by sale; and (3) the profit on the goods sold. In order to bring about the separation of the merchandise records into the two elements (a) goods still on hand, that is, the asset element, and (b) the profit on goods sold, that is, the income element, it is necessary to bring the detailed accounts together for the purpose of summarization. This summarization is accomplished in much the same way as in the profit and loss statement. The net amount of sales and the net cost of goods sold are determined and set up against each other in order to indicate the gross profit. In arriving at the cost of goods sold it is necessary to bring together the opening inventory, the purchases, the inward freight and cartage, and from their sum to subtract the purchase returns, the purchase rebates and allowances, and the final inventory. How this is accomplished in the ledger is explained by an illustration, in which the adjustments or transfers between

accounts are traced by means of cross-index letters.

Assume the following facts: Goods on hand January 1, 19—, $10,125.67; purchases for six months $47,897.42; inward freight and cartage $560.25; returned purchases $2,125.40; purchase rebates and allowances $267.92; sales $65,283.21; returned sales $3,924.83; sales rebates and allowances $392.48; and goods on hand June 30, 19—, $11,267.40. Each of these items appears as the first entry on the proper side of its account, and is distinguished by not being marked with a bracketed letter. The items comprise the ledger record previous to summarization at the close of the fiscal period.

MERCHANDISE INVENTORY ========== 19— | 19— Jan. 1 10,125.67 | June 30 Purchases (B) 10,125.67 --------- | --------- June 30 (E) 11,267.40 |

PURCHASES ========== 19— | 19— June 30 | June 30 (Total purchases) 47,897.42 | Returned Purchases Inward Freight | (C) 2,125.40 and Cartage | Pur. Rebates & (A) 560.25 | Allow (D) 267.92 Mdse. Inventory, | Inventory, Jan. 1 (B) 10,125.67 | June 30 (E) 11,267.40 | Profit & Loss (F) 44,922.62 --------- | --------- 58,583.34 | 58,583.34 ========= | =========

INWARD FREIGHT AND CARTAGE ========== 19— | 19— June 30 (Total) 560.25 | June 30 Purchases (A) 560.25 ------ | ------

RETURNED PURCHASES ========== 19— | 19— June 30 Purchases (C) 2,125.40 | June 30 (Total) 2,125.40 -------- | ---------

PURCHASES REBATES AND ALLOWANCES ========== 19— | 19— June 30 Purchases (D) 267.92 | June 30 (Total) 267.92 ------ | ------

SALES ========== 19— | 19— June 30 | June 30 Returned | (Total) 65,283.21 Sales (G) 3,924.83 | Sales Rebates & | Allow (H) 392.48 | Profit & Loss (I) 60,965.90 | --------- | --------- 65,283.21 | 65,283.21 ========= | =========

RETURNED SALES ========== 19— | 19— June 30 (Total) 3,924.83 | June 30 Sales (G) 3,924.83 -------- | --------

SALES REBATES AND ALLOWANCES ========== 19— | 19— June 30 (Total) 392.48 | June 30 Sales (H) 392.48 ------ | ------

PROFIT AND LOSS ========== 19— | 19— June 30 Purchases (F) 44,922.62 | June 30 Sales (I) 60,965.90 --------- | ---------

To show the total cost of goods bought during the period, the freight-in of $560.25 is transferred or closed into Purchases. To show the “_gross_ cost of goods to be accounted for,” amounting to $58,583.34, the inventory of January 1 of $10,125.67 is transferred to the debit side of Purchases account. To show the _net_ cost of goods to be accounted for, the returned purchases and allowances are deducted from this gross cost by being transferred to the credit side of Purchases. The balance in Purchases account at this point, viz., $58,583.34 minus $2,393.32, or $56,190.02, indicates the net cost of goods to be accounted for.

This item of $56,190.02 is not indicated in the account, however, but is given here simply to make the discussion intelligible. Part of this $56,190.02 (net cost of goods to be accounted for), amounting to $11,267.40, is the cost value of the unsold goods according to the inventory of June 30, and the balance of $44,922.62 ($56,190.02 minus $11,267.40) constitutes therefore the _cost of the goods sold_. This final inventory is also shown as an asset on the debit side of Merchandise Inventory in the new section of the account, i.e., the portion of the account following the _initial_ inventory section which has now been closed and ruled off as shown on page 118.

Put in a somewhat different form, we may say that the cost of goods sold is found by subtracting from the gross cost of goods to be accounted for, $58,583.34, first the returns and the rebates, $2,393.32, and then the amount of the closing inventory of June 30, $11,267.40. The balance left of $44,922.62 represents the _cost of goods sold_. This balance is now transferred to the debit of Profit and Loss account.

All the transfer entries given above have their debits and credits determined as explained in Chapter XIV. The student should note that the same additions and subtractions are thus brought about in the Purchases account as are made arithmetically in the section of the profit and loss statement given over to cost of goods sold.

The Sales account is debited with the balances of the Returned, Sales and Sales Rebates and Allowances, thus showing a balance of net income from sales which is transferred to the credit of Profit and Loss. The Profit and Loss account then shows net income from sales on the credit side, and cost of goods sold on the debit side. The difference between the two sides is gross profit on sales. All of the merchandise accounts, except the Inventory account, are now balanced, and should be ruled off in the manner explained in Chapter XIV.

The second illustration covers the case where the stock-in-trade record is kept in one mixed account called Merchandise. Using the same data as in the other illustration, the account appears as follows:

MERCHANDISE ========== 19— | 19— Jan. 1 Inventory 10,125.67 | June 30 Sales 65,283.21 June 30 Purchases 47,897.42 | Returned Purchases 2,125.40 Returned Sales 3,924.83 | Sales Rebates | Purchases Rebates and Allow 392.48 | and Allow 267.92 Inward Freight | and Cartage 560.25 | Inventory, June 30 11,267.40 Profit and Loss 16,043.28 | --------- --------- | 78,943.93 | 78,943.93 ========= | ========= June 30 Inventory 11,267.40 |

When the merchandise record is kept under separate accounts the freight-in is _transferred_ to the debit of the Purchases account; but when a single mixed account is kept with merchandise, freight-in is usually entered directly to the debit of that account. To adjust the account when kept in this manner, the new inventory is entered to the credit of Merchandise. The balance of the Merchandise account now shows the gross profit on sales, $16,043.28. This is transferred to the credit of Profit and Loss. (It will be noted that this _transferred_ item is identical with the _balance_ of the Profit and Loss account of the first illustration.) The Merchandise account is now totaled and ruled off. On the debit side, beneath the ruling, the new inventory is entered, being the contra to the credit entry of $11,267.40 above the ruling. The equilibrium of debits and credits is thus maintained. In this open item of $11,267.40 the account shows an asset, the goods on hand June 30.

The handling of merchandise transactions according to the second illustration is not considered good accounting but is shown because it is frequently met with in bookkeeping practice.

=Underlying Theory in the Adjustment of Merchandise Records.=—Careful analysis and study of the adjustment of the merchandise records should be made in order to see the way in which the logic of the trading section of the profit and loss statement is worked out in the ledger. The record of the merchandise asset should be kept, in strict theory, in the same way as that of every other asset, namely, the accounts should be charged with the full cost of the asset and credited at cost price with the portion sold, the profit or loss on the sale being carried in a separate account. The balance of the Merchandise account would then show the value of the asset merchandise on hand at any time.

Theory, however, gives way to the practical difficulties of handling the account in this way. Therefore, periodically the mixture of asset decreases and income increases brought about through this practical method of handling merchandise records must be corrected, or “unmixed,” so that these elements will appear separately. The Purchases account, after the opening inventory, the inward freight, and the purchase returns, rebates, and allowances are transferred to it, gives the net total of the merchandise asset for the period. This net total represents two things: (1) merchandise still on hand, and (2) merchandise sold. By way of adjusting the records, the goods on hand, as shown by the physical inventory, are separated from the total and put into the Merchandise Inventory account, which shows by its title that it is an asset. That leaves in the Purchases account the cost of goods sold. The credits which should indicate the decrease in the asset, equal to the cost of goods sold, are found in the net merchandise sales, as shown by the Sales account after transferring to it the sales returns, rebates, and allowances. But these credits are here mixed with the gross profit. The portion of the net sales representing the cost of sales of merchandise should now, in strict theory, be transferred from the Sales account to the Purchases account. This transfer would effect the balancing of the Purchases account, indicating that there are no merchandise asset values in that account, these having been transferred to the Merchandise Inventory account. The result of this theoretically correct procedure would be to bring about a segregation of the merchandise records into their two elements, the asset element as shown by the Merchandise Inventory account and the income element as shown by the remaining balance in the Sales account.

Once again, however, strict theory gives place to the more practical need of requiring the accounts to give full information for management purposes. Accordingly, instead of handling them in the way just indicated, the adjustment procedure explained on pages 118 to 120 is followed.

=Handling Depreciation of Fixed Assets.=—As shown in Chapter XIII, the method of handling depreciation of assets consists of nothing more than separating the expense element from the asset element, both of which are carried currently under the title of the asset. For reasons explained in Chapter XIII, the credit to the asset which effects the separation is not recorded in the asset account but in a supplementary account entitled “Depreciation Reserve” for the particular asset. This reserve account is an integral part of the asset record and must always be considered in connection with the asset account in determining the value of the asset. The credit entry in the reserve account is a sort of suspended credit, recorded there temporarily for purposes of information. The offsetting debit to this credit is made in the expense account Depreciation.

The adjustment entry thus effects a separation of the asset account into the two elements, (1) present value of the asset as shown by the asset account and its depreciation reserve account, and (2) the expense element recorded under the Depreciation expense account. The following illustration indicates the bookkeeping procedure:

FURNITURE AND FIXTURES ========== 19— | Jan. 1 750.00 |

DEPRECIATION RESERVE FURNITURE AND FIXTURES ========== | 19- | June 30 (A) 75.00

DEPRECIATION ========== 19— | 19— June 30 (A) 75.00 | June 30 Profit & Loss (B) 75.00 ----- | -----

PROFIT AND LOSS ========== 19— | June 30 Depreciation (B) 75.00 |

The asset Furniture and Fixtures, valued at $750 at the beginning of the year, is estimated by appraisal to have depreciated 10%, or $75, during the half-year. This cost or expense is charged to an account called Depreciation, and credited not to Furniture and Fixtures, but to the valuation account “Depreciation Reserve Furniture and Fixtures.” The Furniture and Fixtures account and its valuation account, _taken together_, show the appraisal value of $675. Thus the credit adjusting entry is made to record a decrease in asset values. The Depreciation account, carrying the debit of $75, is an expense account and is closed into Profit and Loss, just as any other expense account is closed.

=The Estimate for Doubtful Accounts.=—At the close of a fiscal period, when an accurate statement of the financial condition of the business is to be drawn up, all assets must be very carefully valued. The bookkeeping procedure necessary to show the correct value of fixed assets subject to depreciation has been explained. The outstanding claims against customers also require evaluation. Every business man knows from past experience that he will be unable to collect all of his outstanding accounts. He may not know which of the accounts will prove uncollectible, but he does know that there will be a loss in the sum total of these claims against customers. The amount of this estimate is based on past experience in each business.

A standard basis for the estimate is not possible because in some businesses credit is extended much more carefully than in other businesses and in some collections are followed up more vigorously than in others. In making the estimate two methods are used, one being a certain percentage of the outstanding accounts, the other being a certain percentage of the sales made during the period. Where experience shows the necessity, the loss from both outstanding accounts and notes receivable is provided for.

The same bookkeeping procedure is used here as with the estimate of depreciation. An expense account, usually entitled “Bad Debts,” is debited, and an account called “Reserve for Doubtful Accounts” is credited for the amount of the estimated loss. The effect of the entry is to separate the claims against customers into their two elements, namely, the true asset element, represented by the difference between the asset account and its valuation reserve account, and the expense element as indicated by the Bad Debts account.

The following illustration sets forth the method of handling bad debts on the books of account:

ACCOUNTS RECEIVABLE ========== 19— | June 30 100,000.00 |

RESERVE FOR DOUBTFUL ACCOUNTS ========== | 19— | June 30 (A) 2,000.00

BAD DEBTS ========== 19— | 19— June 30 (A) 2,000.00 | June 30 -------- | Profit and Loss (B) 2,000.00 | --------

PROFIT AND LOSS ========== 19— | June 30 Bad Debts (B) 2,000.00 |

It is known, from past experience, that the asset Accounts Receivable, $100,000 in this instance, will not be collected in full. To bring this book value down to its real value, the estimated loss, which it is thought will be 2% of the outstanding accounts, is reserved from their value, that is, credited to a reserve account, which is to be taken in conjunction with the asset account. The offsetting debit is to Bad Debts, an expense account. It represents an expense which the current period has to bear, and is closed into Profit and Loss with other expense accounts.

=Handling Prepaid and Accrued Expenses and Income.=—The method of handling the estimates or inventories of prepaid and accrued expenses and income is very similar to that shown for handling the mixed Merchandise account. Illustrations follow:

INSURANCE ========== 19— | 19— Jan. 1 (Paid) 150.00 | June 30 (Unexpired) 125.00 | Profit and Loss 25.00 ------ | ------ 150.00 | 150.00 ====== | ====== June 30 (Deferred) 125.00 |

RENT INCOME ========== 19— | 19— June 30 (Unearned) 250.00 | June 15 (Received) 300.00 Profit and Loss 50.00 | ------ | ------ 300.00 | 300.00 ====== | ====== | June 30 (Deferred) 250.00

WAGES ========== 19— | 19— June 30 (Paid) 2,125.00 | June 30 Profit and Loss 2,325.00 (Accrued, unpaid) 200.00 | -------- -------- | 2,325.00 | 2,325.00 ======== | ======== | June 30 (Accrued) 200.00

INTEREST INCOME ========== 19— | 19— June 30 Profit and Loss 145.00 | June 30 (Received) 127.50 | (Accrued, due us) 17.50 ------ | ------ 145.00 | 145.00 ====== | ====== June 30 (Accrued) 17.50 |

The first account, Insurance, shows the method of handling a deferred or prepaid expense. At the close of the period the account is a mixed account, the unexpired portion of the insurance representing an asset to be shown on the balance sheet as a deferred charge, the expired or consumed portion representing an expense for the period to be closed into Profit and Loss. Insurance has been paid, in this case for a three-year term; hence only one-sixth of it is chargeable to the first half-year, the remainder being deferred to later periods. The amount of the inventory or unexpired portion is entered to the credit of the account in order to effect subtraction of the amount, the balance of $25 thereby showing the insurance cost for the current period. This balance is carried to Profit and Loss. After closing the account, the inventory is entered to the debit side below the ruling, thus showing the so-called “deferred asset” portion which will appear in the balance sheet.

The next account, Rent Income, is a mixed account with income and liability elements. It shows that rent has been received for a period which extends beyond the current fiscal period. On June 15, rent for the period of, say, June 15 to September 15 was received. Only one-sixth of this income applies to the term January 1 to June 30; therefore the balance of $250 must be deferred or carried over to the next fiscal period. The adjustment is made by an entry of $250 for unearned rent on the debit side to effect its subtraction from the earnings for the current period, thus reducing them to $50. This income of $50 is transferred to the credit of the Profit and Loss account. After the Rent account is ruled off, the deferred income is entered below the ruling on the credit side, forming a part of the earnings of the next period. It is shown among the liabilities in the balance sheet for the current period, usually under the caption of “Deferred Income.”

The third account, Wages, shows wages paid to June 30 of $2,125. At that date wages earned but not yet paid, perhaps because the pay-day did not coincide with the date of closing the books, amounted to $200. This item is obviously an expense of the current period incurred during the short interval between the last pay-day in June and June 30. The adjustment is therefore made by entering $200 on the debit side of the Wages account, to effect the _addition_ of this sum to the expense already shown there. The

total amount of the account is transferred to Profit and Loss and the account is ruled off. The amount of unpaid wages, $200, is shown on the credit side beneath the ruling. In the balance sheet it appears as a liability, usually under the caption of “Accrued Expense.”

Similarly with the fourth account, Interest Income. Income to date is $127.50; earned but not yet due on June 30, $17.50, showing full earnings of $145 for the current period. This total is transferred to Profit and Loss, the account is ruled off, and the earned but not received portion is shown as a debit beneath the ruling, and as an asset in the balance sheet.

Great care must be exercised in the adjustment of all inventories to maintain the equilibrium of the ledger by the entry of each amount to both the debit and credit sides.

Besides the four illustrations given above, there are many other accounts requiring the same kind of adjustment entries. In certain special cases it may be necessary to make adjustments on both sides, as for example in a general expense account or in a mixed interest account showing both interest income and interest expense. For illustration a mixed interest account is shown. The debit opening item of $100 in the new section of the account represents an asset, an interest claim against outsiders, while the credit opening item of $50 represents the liability to others for interest due them but not yet paid. For the sake of accuracy and clarity, however, the better bookkeeping practice is to keep separate accounts for Interest Income and Interest Cost.

INTEREST ========== 19— | 19— June 30 (Paid) 400.00 | June 30 (Received) 500.00 (Unpaid) 50.00 | (Accrued, due us) 100.00 Profit and Loss 150.00 | ------ | 600.00 | 600.00 ====== | ====== June 30 (Accrued) 100.00 | June 30 (Unpaid) 50.00

=Summarizing the Ledger—The Profit and Loss Account.=—After all the types of adjustments have been made, the accounts in the ledger are restored to their fundamental classifications, namely, assets, liabilities, and proprietorship. There is now no intermixture of these basic elements. The proprietorship group of accounts shows both the vested proprietorship, that is, the capital at the beginning of the period, and the temporary proprietorship, that is, the increases and decreases (as indicated by the income and expense accounts) which have taken place during the current period.

At the close of the fiscal period, when the temporary proprietorship accounts have served their purpose by showing the day-to-day changes in proprietorship and the results must be summed up, these accounts are closed for the current period so as to keep the records separate from those of the next period. For the purpose of summarizing the profit and loss group of accounts, an _account_ called Profit and Loss is opened in the ledger and to it the balances of all temporary proprietorship accounts are transferred.

The Profit and Loss _account_ in the ledger must not be confused with the formal _statement_ of profit and loss, made up outside the ledger just as is the balance sheet. On the credit side of Profit and Loss will appear all credit or income account balances, and on the debit side will appear all debit or expense account balances. Accordingly, if the balance of the Profit and Loss account is a credit balance, it shows a net profit for the period; if a debit balance, it shows a net loss for the period.

The net profit or net loss shown by the Profit and Loss account represents either an increase or decrease in proprietorship, and as such is transferred to the proprietor’s personal account. As explained in Chapter XII, this account usually shows his drawings during the period against these profits as they were assumed to be accruing. The personal account thus indicates whether the amount which he has drawn out is larger or smaller than the net profits as determined by the Profit and Loss account. If his profits are larger than his drawings, his capital has been increased by the amount of the credit balance in his personal account and the transfer of this balance to the credit side of his capital account will then show the total net worth of the business. If his drawings are larger than the profits, there is a decrease in capital, as shown by the debit balance of his personal account, and the transfer of this balance to the debit side of the capital account reduces the former capital amount.

The summarization of results at the close of a period is called “closing the ledger.” The procedure consists, first, in a transfer, i.e., in a closing out, of all the temporary proprietorship accounts to the Profit and Loss account; second, in the transfer of the balance of this account to the owner’s personal account; and third, in the transfer of the balance of the personal account to the owner’s capital account. After all temporary proprietorship accounts, the Profit and Loss account, and the owner’s personal account have been closed, the only accounts remaining open on the ledger are those showing either assets, liabilities, or capital. A formal statement of the balances of these accounts constitutes the balance sheet. The accounts through which the income and expense records of the business are closed, summarized, and transferred to the vested proprietorship account, are shown below, with typical entries:

PROFIT AND LOSS ========== 19— | 19— June 30 | June 30 Purchases (Cost | Sales (Net income of Goods Sold) 15,000.00 | from sales) 30,000.00 Sales Salaries 5,000.00 | Delivery Expense 500.00 | Office Salaries 2,400.00 | Supplies, Postage, | etc. 200.00 | Insurance 150.00 | Bad Debts 500.00 | Interest 150.00 | Depreciation 200.00 | John Doe, Personal | (Balance) 5,900.00 | --------- | --------- 30,000.00 | 30,000.00 ========= | =========

JOHN DOE, PERSONAL ========== 19— | 19— Jan. 5 Cash 300.00 | June 30 Profit and Loss Feb. 10 ” 250.00 | (Net profit) 5,900.00 Mar. 3 ” 150.00 | Apr. 1 ” 200.00 | May 10 ” 300.00 | June 3 ” 250.00 | 30 John Doe, Capital | (Balance) 4,450.00 | -------- | -------- 5,900.00 | 5,900.00 ======== | ========

CHAPTER XVI

SOURCES OF DATA FOR THE LEDGER

=Insufficiency of the Ledger Record.=—In an earlier chapter a business transaction was defined as an exchange of values, and the ledger as the book in which transactions are grouped under predetermined titles or names. Thus, all transactions relating to machinery are grouped under the title “Machinery”; those relating to cash under the title of “Cash”; those to purchases under the name “Purchases”; etc. Even in a small business the ledger may contain a large number of accounts, all necessary to give a clear-cut presentation of the volume and significance of business transactions.

The ledger record presents an analysis of transactions into their component elements, each transaction being classified and recorded, usually, in at least two ledger accounts, and frequently in more. Consequently, in order to learn the nature of a given transaction, to see it in its entirety, it may be necessary to refer to a number of separate ledger accounts. This process, even if the ledger is small, is not always easy; and when the ledger contains a large number of accounts, it becomes practically impossible. Accordingly, another kind of record is needed.

=The Book of First Record.=—This other record shows in one place the transaction in its entirety; it gives a complete statement of the conditions and all other data relating to the transaction. It also shows the fundamental analysis of the transaction into its debit and credit elements under appropriate titles. It is called the original or first record. Usually it is not the very first record made of the transaction but it is the first record made in the books of account. The book in which this record is kept is called the “Journal.” The record as kept in the ledger is a secondary record based on the original or first record in the journal. Because of its secondary nature, courts will not accept the ledger as evidence without verification.

=Posting to the Ledger.=—The act of transferring the original entry from the journal into the ledger is called posting to the ledger. In order not to lose sight of the original record in the journal it is important that the ledger entry show by letter and number the book and page where the original entry can be found. This index is entered in what is called the reference column of the ledger account, which is just to the left of the money column. In this manner every entry in a ledger account has a reference to the original entry pertaining thereto.

=The Journal.=—A journal may be defined as a diary or log in which the happenings or transactions of a business are recorded in chronological order; that is, consecutively day by day as they arise. Formerly it was sometimes called a day-book or blotter. As usually operated, however, the day-book or blotter contained a rough record giving all the essential data relating to each transaction without regard to accounting terminology, i.e., without regard to the formulation of the debit and credit of each transaction. The day-book entry was a sort of memorandum from which a formal record was made in the journal. This day-book or blotter, though still in use in some places, has very largely been discarded and only the formal journal is used. This latter was originally a single book but in modern accounting practice it has become separated into many special journals.

=Characteristics of the Journal.=—1. Being of the nature of a diary, the journal shows each day’s transactions in consecutive order with little regard to grouping. The first characteristic, therefore, of the journal is that it is a book of chronological entry, a record of each transaction just as it took place, with the entries made according to the dates of the transactions.

2. Another characteristic of the journal entry is that it is an analytical and classifying record. Before the entry is made, the transaction is analyzed into its two elements of debit and credit, determined according to the effect the transaction has in increasing

and decreasing assets, liabilities, or proprietorship. The account titles used in the journal are the same as those used in the ledger and are selected on the basis of a detailed subclassification of the three fundamental groups of accounts. The degree of detail in classification depends on the desired minuteness of the information required. The guiding principle in giving these titles is to use such names as will tell truthfully and accurately what kind of information is recorded under each head. A journal entry is therefore an analytical record as to debit and credit, which classifies the different elements of the transaction under such titles as will later be used in the ledger.

3. A final and a very essential characteristic of the journal is that every entry should carry in addition to account titles, with their debit and credit amounts, a brief but complete summary of all the conditions and data relating to the transaction, so that, if referred to in the future, the journal record will call to mind the essentials of the entire transaction.

Because of these three characteristics, and particularly the last two, the journal record is of prime importance.

=Equilibrium of the Journal Entry; Compound Entries.=—As explained in a preceding chapter, the debit and credit elements of all transactions must be equal in amount. Since the journal entry is an analysis of the transaction, it must obviously show equal amounts in the debit and credit columns. In case the analysis and classification require an entry consisting of more than one debit and one credit item, the total of the several debit items must equal the total of the several credit items. Such an entry is called a compound journal entry.

=Standard Form of Journal.=—The standard form of journal provides spaces for the following information: date, classification as to debit and credit, ledger index column, money columns to show both the debit and credit amounts, and full record of the essentials of the transaction. The following form illustrates a complete journal entry:

========== 19— | | | | Jan.| 10 | Notes Receivable | 10 | 1,000.00 | | | James Jackson | 14 | | 1,000.00 | | 60-day note, payable at | | | | First National Bank, | | | | Perryville, Maryland, | | | | with interest at 6% per | | | | annum. Due March 10, 19— | | |

Form 6. Standard Form of Journal

The date is sometimes shown in the middle of the first blank line; but it is better to place it at the extreme left. The account titles are placed on separate lines unencumbered with other data, because they are of first importance in posting. The name of the debit account is shown on the extreme left of the explanation column, with a uniform margin to the right for the credit account. The debit and credit amounts are placed in the left and right money columns respectively. Data giving full explanation of the entry are shown directly below the classified debit and credit entry, slightly to the right of the margin of the credit account title, and a uniform margin is maintained down the page. The column to the left of the money columns shows the ledger pages to which the entry is posted. The entry is read thus: Notes Receivable, debit; James Jackson, credit, $1,000.00.

CHAPTER XVII

THE SUBDIVISION OF THE JOURNAL

=Inadequacy of the Old Journal.=—As explained in the previous chapter, every business transaction was formerly entered in the journal. This necessitated the making of a formal debit and credit entry for every item, many of which were of the same kind. As the object of every business is to sell something, during any business day a large number of sales, in consequence, had to be analyzed, classified, and entered separately. The entry in each case was a credit to Sales, and either a debit to the customer if the sale was “on time,” or a debit to Cash if the sale was for cash. It was soon perceived that instead of making a separate entry for each sale, one entry could be used for bringing into the books all the sales for a given day. This was accomplished by carrying a memorandum of the individual transactions until the close of the day when a formal summary or compound entry was made in the journal. Such a summary or compound journal entry is illustrated below:

A. Jackson 175.00 D. Hayes 25.00 J. M. Marshall 132.50 T. P. Pollard 79.40 I. M. Cranston 93.20 M. V. Johnson 17.15 Sales 522.25 To record the day’s sales.

The memorandum of each sale was made in a blotter to record the quantities and kind of goods sold but such entry formed no part of the double-entry record, being merely the source of information for the formal summary entry.

=The Special Journal a Labor-Saving Device.=—This use of the journal can also be made in connection with other transactions, with similar great saving of labor. Throughout the day in every business there is a large number of cash transactions—receipts and disbursements—which require a debit and credit record. Also purchases of merchandise, although not numerous for any particular day, comprise a large number of entries during the course of a month or year. To save the labor of so many entries, the original journal is divided into separate books known as special journals, each containing the original entries for a particular group of similar transactions, the number of books corresponding to the number of groups into which the various transactions are divided.

For instance, where the policy of the business is to encourage the settlement of outstanding customers' accounts by notes, the use of a notes receivable book or journal effects a very appreciable saving of labor. Through the use of such a book, limited to a record of nothing but notes receivable, it is unnecessary to write each time a note is received, a complete journal entry as follows:

Notes Receivable 1,500.00 James Jackson 1,500.00

Instead, the entry of Jackson's name in the notes receivable journal is in itself evidence of a debit to Notes Receivable account. Thus only the credit side of the entry need be shown, with appropriate explanation and detail, the formal debit being suppressed. When, however, the books are closed at the end of each regular period, the total of all these entries in the notes receivable journal is formally labeled "Notes Receivable, Dr." and posted to the debit of the Notes Receivable account. This procedure brings on the ledger one debit entry for the transactions of the entire month. The corresponding credits have been posted in detail day by day from their journal record.

So also, when it is the practice of the business to issue many of its own notes either in payment of purchases or for discount purposes, a "Notes Payable Journal" may be used. The method of handling this book is similar to that of handling the notes receivable journal as described above. A similar procedure is followed in the case of sales, purchase, and cash transactions referred to above. The method of handling these four groups of transactions will be explained in detail in the chapters which follow.

=Basis of Subdivisions.=—The basis for dividing the one general journal into special journals is the relative frequency with which transactions of a similar nature occur. It would evidently be of no utility to create a special journal if the number of transactions to be recorded in it was small, as the saving in the labor of making the entries would be more than offset by the trouble of using an extra book.

=Customary Subdivisions.=—The special journals most frequently met with are those for purchases, sales, and cash. The Purchase Journal contains the original entry of purchases, the Sales Journal the original entry of sales, and the Cash Journals the original entry of cash transactions. All _other_ original entries are made in the general journal. For the sake of brevity, the general journal is usually designated by the single term "Journal."

It should be thoroughly understood that no matter how many special divisions of the journal may be in use, such books combined with the general journal comprise the _journal_ record of transactions. None of them is merely a memorandum record to be summarized and to be formally recorded later. The record made in each is formal, although abbreviated, and each must be posted completely, both debit and credit, in order to secure in the ledger a full record of all business transactions.

A brief explanation will be given in following chapters of the more simple forms of special journals.

CHAPTER XVIII

THE PURCHASE AND THE SALES JOURNALS

=Types of Purchase Journal.=—For recording purchases of stock-in-trade, a separate special journal called "Purchase Journal" is used. Sometimes this special journal takes the form of what is called an "Invoice Book," explanation of which is given in a later chapter. The purchase journal is sometimes used to record all sorts of purchases, as for example, purchases of store and office supplies, of advertising and printing, and even of services such as labor, and of uses, such as the use of a building. Such use of the journal is more commonly made by manufacturing concerns than by mercantile houses and the journal is then known as a "Voucher" or "Accounts Payable Register," which is explained in Volume II. The present discussion is limited to the purchase journal as a record of purchases of stock-in-trade by a mercantile firm.

=Analysis of the Purchase Transaction.=—The debit and credit analysis of a transaction covering a purchase of stock-in-trade may result in either one of two groups of entries: (1) if the transaction is on credit, a debit to Purchases and a credit to either a personal

account payable or to Notes Payable account; or (2) if the transaction is for cash, a debit to Purchases and a credit to Cash. Whether the purchase is on open account, on a note, or for cash, it is often desirable to keep the accounts in such a way as not only to indicate the vendor in each instance, but also to show the volume of business done with each creditor. This is accomplished when the purchase is for cash or for a note, by opening an account with the creditor in much the same way as when it is on open account.

Thus every purchase transaction is first recorded as follows:

(1) Purchases Vendor

If the purchase is a cash purchase, the liability to the vendor is immediately canceled by the entry:

(2) Vendor Cash

The vendor's account is canceled by being credited and then immediately debited with the same amount. This leaves on the books as the net result of these two entries a debit to Purchases and a credit to Cash. This record of the transaction is seen therefore to agree with the analysis of the cash purchase transaction as previously explained.

Instead of opening individual accounts with each vendor, in the case of cash purchases, the same result is sometimes accomplished by the use of one account called "Sundry Cash Creditors." To it all such cash purchase transactions are posted both from purchase journal and cash book. This method records the combined liability to all vendors in one account. It does not, however, show the volume of business done with each creditor.

If the purchase is on a note, the liability to the vendor as set up in entry (1) is immediately canceled by the entry:

(3) Vendor Notes Payable

The net result of these entries, (1) and (3), is seen to be a debit to Purchases and a credit to Notes Payable—a record which corresponds with the original analysis of the transaction.

Since a purchase on open account also results in a debit to Purchases and a credit to Vendor, it is seen that all types of purchase transactions may be recorded as a debit to Purchases and a credit to Vendor. Accordingly, in making the current record in the purchase journal, the debit element may be omitted, since it is always the same, and only the credit element, which differs in each case, may be set up. Periodically, usually at the close of each month, the debit element is formally set up for the total amount of purchases for the period. (See Form 7, a typical purchase journal.) Thus the one formal debit is made to offset the numerous credits set up during the month. The purchase journal is thus seen to be as fully a debit and credit journal as the general journal, even though in making its day-to-day record the debit element is, for the sake of economy in labor, omitted.

Other methods of handling the cash and note purchase transaction are explained on page 152.

=Form and Method of Using the Purchase Journal.=—The simplest form of purchase journal is the same as that of the standard journal. It provides space for date, classification, explanation, ledger index, and two money columns. In the purchase journal the money columns do not have "debit" and "credit" significance, but the first may be used for the detailed extensions and the other column for the total of each purchase. Assume, for the sake of illustration, that the following purchases have been made:

January 10, 19—, from S. C. Bontell, terms 2/10, n/30: 5 tons hay @ $12.00 100 bu. corn @ .90 1,000 bu. wheat @ 1.10 30 tons coal @ 4.50 January 18, 19—, from P. V. Stewart, terms 2/10, n/30: 50 tons hay @ $12.00 130 tons coal @ 5.00 January 22, 19—, from I. S. Van Doren, terms n/30: 100 tons coal @ $ 4.50 600 bu. wheat @ 1.00 January 28, 19—, from S. M. Sax, terms 2/10, n/60: 510 bu. wheat @ $ 1.10

The purchase journal record, using the simple form of the standard journal, would be as follows:

[Illustration: Form 7. Purchase Journal]

Usually, however, a form of purchase journal is used which is better adapted to its purpose. In this, instead of giving the detailed explanation, the file number of the original invoice is written as part of the explanatory matter, which usually comprises only this file reference and the terms of the purchase. This modern type of journal is illustrated below.

[Illustration: Form 8. Modern Type of Purchase Journal]

=Posting the Purchase Journal.=—In posting the purchase journal, it is customary to post daily the credits to the various vendor accounts as they are entered from day-to-day in the journal. In this way the true status of the amounts due these creditors may be known at any time by reference to their ledger accounts. The offsetting debit to Purchases account is posted only at the end of the month when the purchase journal is summarized. In the meantime the ledger is out of equilibrium because only the credit side of all purchase transactions has been entered in the ledger. This equilibrium is restored, however, by the monthly posting of the debit to Purchases account which must always be made before the trial balance is taken.

An essential part of posting is the cross-indexing of the two records, the journal and the ledger. The cross-reference column in the ledger account must show the initial and page of the journal from which each item is posted. For example, “P. 10” in the ledger would refer to purchase journal, page 10. Likewise the ledger folio (L.F. or Folio) column in the journal must show the ledger page of the account to which the item has been posted. Thus, in the illustration, Stewart’s account is on page 125 of the ledger, where he is credited with $1,250. At the end of the month the purchase journal is footed and the summary entry, “Purchases, Dr.,” is made and posted to the debit of Purchases account on page 10 of the ledger. This one debit item in the ledger brings about the equilibrium with the individual credits posted to the various personal accounts payable. The purchase journal is then ruled off and thus made ready for new entries for the next month immediately below the rulings.

=Departmental Analysis of Purchases.=—When it is desirable to separate various classes of purchases so as to determine the profit from each class, particularly in a business which is departmentized, a purchase journal similar to the one shown in Form 9, which has an additional money column for each class of purchases, may be used. If there are three classes or departments, at least four money columns are required. The entry in the first column is for the total amount of the purchases; and the entries in the other three columns, which are headed each with the name of a class or department, are for the total purchases of the respective departments. It is evident that the totals of these three columns, added together, must at all times be equal to the total of the first column. This affords a check on the accuracy of the distribution. At posting time a separate account is opened in the ledger corresponding to each of these classes of purchases. The summary entry in a purchase journal of this kind appears as follows:

[Illustration: Form 9. Departmental Purchase Journal]

Purchases are classified under separate titles, usually because it is desirable to make a corresponding classification of sales and so secure departmental results of operation.

=The Sales Journal—Analysis of the Sales Transaction and Method of Record.=—For recording sales of stock-in-trade, a record called the “Sales Journal” is used, which is limited to sales of merchandise. A sales journal practically identical in form with the purchase journal serves this purpose. Its columns are ruled and current entries are made in it just as in the purchase journal.

The analysis of a sales transaction shows a credit to Sales and a debit either to Customer, Cash, or Notes Receivable, according as the sale is “on time,” for cash, or against a note given by the customer. In handling cash sales and sales against the customer’s note, the same procedure is followed as with purchases, i.e., accounts with customers are opened for _all_ sales, and are immediately closed off if cash or a note is received at the time of the sale.

The current entry in the sales journal shows only the debit item, i.e., the charge to the customer’s account, the credit to Sales account being omitted. At the end of the month, however, the total of all sales is indicated by the summary entry and is posted to the credit side of the Sales account in the ledger. In order to keep the customers’ accounts up to date, the current entries in the sales book, giving the names of the customers and the amounts, are transferred to the customers’ accounts in the ledger at the close of each day.

=Summarization of the Sales Journal.=—At the end of the month or other posting time, the sales journal is totaled and the summary entry is made and posted, thus bringing the ledger into equilibrium by one credit to Sales account for the sum of all the debits to customers accounts made day by day. The closing rulings are then made. The treatment is exactly similar to the work in the purchase journal, the only difference being in the summary entry, where “Sales, Cr.” takes the place of “Purchases, Dr.” If it is desired to keep the sales record by departments or classes of commodities, analysis columns will effect the distribution. In this type of sales record the closing summary indicates the various departmental or other sales accounts to which postings are to be made, instead of the one general account, Sales, precisely as the departmental purchase journal (Form 9) indicates the departmental or other purchases accounts to which purchase entries are to be posted.

=Goods Sold to the Owner.=—The treatment of goods sold to the owner of the business requires brief consideration. The proprietor usually withdraws goods at cost price. There is thus no element of profit in the transaction as there is in other sales. A strict analysis of the transaction shows that it brings about only a decrease of the asset unmixed with any element of income. Theoretically, then, such transactions should not be recorded with the regular sales, but should be shown as a credit to Purchases account. In practice, however, entering them in the sales journal is the easiest method of recording them, and since they are not usually large in volume, this method does not vitiate the total sales figure as a basis for estimating percentages of profit. This matter is discussed in detail on page 273.

CHAPTER XIX

THE CASH JOURNALS

=The Cash Book.=—For recording transactions involving cash, two journals are used. One of these records receipts and the other disbursements of cash. They are known respectively as the “Cash Receipts Journal” and the “Cash Disbursements Journal.” Instead of being separate books, however, they are usually bound together and comprise what is called the “Cash Book.” When bound together their pages alternate throughout the book. The cash receipts journal occupies the left-hand pages, i.e., the even numbered pages—2, 4, 6, etc.—and the cash disbursements journal the right-hand pages—3, 5, 7, etc.—page 1 not being used. This method sets up the cash record, receipts and disbursements, on facing pages and the movement of cash is thus under easy and constant review.

=The Cash Receipts Journal—Analysis of a Cash Receipt.=—If $100 cash is received on account from John Doe, a customer, an analysis of the transaction shows “Cash” debit and “John Doe” credit.

Cash 100.00 John Doe 100.00

So with all receipts of cash; the “cash” element is a debit. The record of cash receipts being made in a journal devoted exclusively to receipts of cash, the “Cash, Dr.” element of the entry may be omitted and only the “credit” element need be shown; the very fact that the entry is made in the cash receipts journal is sufficient to indicate that “Cash” is a debit. The cash receipts journal (Form 10)—the left or debit side of the cash book—is operated, therefore very much like the purchase journal.

[Illustration: Form 10. Cash Book (left-hand page) (Cash Receipts Journal)]

=The Cash Disbursements Journal—Analysis of a Cash Disbursement.=—If $10 is paid for expenses of some kind, the analysis gives “Expense” debit and “Cash” credit.

Expense 10.00 Cash 10.00

So with all disbursements of cash. A separate journal being devoted exclusively to cash disbursements, the “Cash, Cr.” element of the entry may be omitted and only the debit shown. The cash disbursements journal is thus seen to be operated in the same way as the sales journal.

Thus, all left-hand pages in the cash book show receipts and all right-hand pages show disbursements. Because it is unnecessary to _write_ the debit element of cash received and the credit element of cash paid out, a great saving of labor is effected. Nevertheless, it must be remembered that the entry on either side of the cash book is essentially a journal entry, and that the missing elements—cash debit on the left page and cash credit on the right page—are supplied at the end of the period by the totals when the two journals are summarized in preparation for posting to the Cash account in the ledger.

[Illustration: Form 11. Cash Book (right-hand page) (Cash Disbursements Journal)]

=Form of the Cash Journals.=—In the cash journals, just as in all other journals, provision is made for date, account classification, explanation, ledger posting index, and money columns. In a simple form of cash book, just as in the purchase and sales journals, two money columns are usually provided, the one for detail—a day’s or week’s detail—and the other for totals. Such a form is shown in Forms 10 and 11. The student should note carefully how the cash receipts journal is summarized. The balance of cash brought forward from the previous week is entered in the second or total column so that the detail column shows only the current week’s receipts. Inasmuch as the Cash account in the ledger already shows the balance of cash at the beginning of the week, i.e., $5,000, this amount must not be included in the summary entry for the current week. In summarizing the cash receipts journal, therefore, the total only of the detail column, showing the cash received since the last summary, is set up as a “Cash, Dr.” item. In

summarizing the cash disbursements journal, since there is normally no balance carried over from the previous week, the total of the journal—representing the cash disbursed since the last summary—is set up as a “Cash, Cr.” item. This is shown as $365, the amount being posted to the credit of the ledger Cash account on page 1.

=Cash Book Taking the Place of the Cash Account.=—Because the two cash journals are set up on facing pages, the record contains essentially the same information as a detailed Cash account in the ledger. The double page record brings together both the receipts and the deductions from receipts—cash being normally a debit account. For this reason the cash book record is itself sometimes used as a ledger account and when it is so used its totals are not posted to the ledger account. The balance of the cash book must, however, be included in the trial balance of the ledger, because when so used the cash book is not only a _journal_ but a _ledger account_ as well.

When, however, the totals of both cash receipts and disbursements are posted to a Cash account in the ledger, the balance used in the trial balance is taken from the ledger account and not from the cash book, although of course the balances in both are the same.

Whichever of these two methods is used, it must always be remembered that the cash book is essentially a journal and that therefore its classifications of business transactions must be transferred to their proper accounts in the ledger.

Best accounting practice, however, requires that a Cash account be carried in the ledger so that the ledger will be a complete record of all transactions and will be independent of all other records for proof of its equilibrium.

=Posting the Cash Book.=—In posting the debit side of the cash book to the ledger, it is important to remember that the debit element of the transaction is merely indicated by the fact that the entry appears on the left-hand page of the cash book. The account name written in the Account Classification column is the credit element and must be posted to the credit of the corresponding account in the ledger. Similarly, on the right-hand side of the cash book, the cash credit element of the entry is suppressed and the named account should be posted to the debit of the corresponding ledger account.

After the posting of the individual items has been completed, the “Cash, Dr.” and the “Cash, Cr.” as shown by the summary entries must be posted to the ledger Cash account, as explained on page 143.

As stated above, each side of the cash book is, in reality, a journal in itself—a cash receipts journal and a cash disbursements journal—and it is only because these two journals are shown side by side that the cash book is sometimes made to serve the purpose of a ledger Cash account.

=Balancing and Ruling the Cash Book.=—The cash book in its simple form is balanced and ruled in the same manner as a ledger account. When the balance is brought down to the new section it is usually entered in the second or total column, thus reserving the first or detail column for the daily or weekly cash receipts, and separating these items from the balance brought down from the previous period. (See Forms 10 and 11.)

When the record is to be transferred to a new page, either the current page (double page) is balanced and ruled and only the balance is carried forward, or the current page is totaled and both debit and credit footings are carried forward as shown in Chapter XIV for the ledger cash account. The cash book is closed, ruled, and transferred as of the same date and on the same line for both sides, although usually there is room for more entries on one side or the other, which may be closed by diagonal ruling. This is done in order to keep the record of the receipts of a given period and that of the disbursements in nearly exact juxtaposition, and thereby facilitate a review of the cash movements for that period.

=The Cash Short and Over Account.=—It sometimes happens that when the cash book is balanced, the amount which ought to be on hand as shown by this balance, does not agree with the amount of cash on hand as shown by actual count. The discrepancy may be due to failure to enter some items of receipts or disbursements in the cash book, or to errors in making change; or it may be due to petty thieving by the cash clerk. If the error cannot be rectified at the time, an entry is made in the cash book, on whichever side necessary, in an amount sufficient to bring the book balance into agreement with the actual cash balance. The account to be debited or credited, as the case may be, is entitled “Cash Short and Over.” If the correct charge or credit is afterwards determined, the item or items should be transferred from Cash Short and Over to their proper accounts. Usually the Cash Short and Over account is treated as an income or expense account and closed into Profit and Loss at the close of the period. Sometimes it is treated as an asset or liability account, depending upon the nature of its contents, i.e., the amount of the discrepancy shown and its probable cause.

=The Cash Purchase and Sales Transactions.=—A standard method of handling the cash purchase transaction when it is desired to keep a record of the volume of business done with each vendor, was explained on page 140, where the purchase was shown to be “washed” or cleared through the vendor’s account. A more direct method is sometimes used.

When purchases are made for cash, a complete record of the transactions is made by the entry:

Purchases Cash

Here there is evidently a conflict of places of original record. The transaction being a purchase, record should be made in the purchase journal; and since it is also a cash transaction, record should also be made in the cash book. However, if an independent record were made in both places, a duplication of the transaction would result, since entry in either journal is a complete debit and credit record. The transaction would be entered twice in full, causing an inflation of the purchases and cash disbursements. In the purchase journal, the credit to Cash would be set up at the time of the transaction and at the time of summarization the debit to Purchases would be included in the total of the Purchases, thus completing the ledger record. In the cash book the debit to Purchases would be set up at the time of the transaction, and when the summary was made the credit to Cash would be in the Cash total. Entry in both journals would, when posted to the ledger, bring about two debits and two credits for the same transaction.

To overcome this difficulty the following methods are commonly employed:

1. The record is made complete in both journals, but the credit to Cash from the purchase journal record is not posted, because that credit will be posted from its record in the cash book. Similarly, when posting the cash disbursements journal, the debit to Purchases is _not_ posted, because that will be posted from the purchase journal. In this way original record may be made in both journals and each journal will then show by its total what it is intended to show, viz., total purchases and total cash disbursed, respectively. In the secondary record, the ledger, only half of each journal entry is set up, the debit to Purchases from the purchase journal and the credit to Cash from the cash book. This prevents the inflation mentioned above and does not destroy the equilibrium of the ledger because there is omitted, when posting from the cash book, a debit equal in amount to the credit omitted when posting the purchase journal.

2. The method explained on page 140 is used with this variation: The record in each journal shows the individual vendor’s account, but at posting time no vendor account is set up in the ledger, neither the credit to the vendor’s account shown in the purchase journal nor its offsetting debit shown in the cash disbursements journal being posted.

It is necessary, when making the original entries in the journals, to indicate all postings which are to be omitted, by entering a check mark, ✔, or a cross, ■, in the ledger folio column of the journal.

The purchase on a note payable, one method of recording which was explained on page 140, may also be handled more directly by either of the methods explained above for a cash purchase. In the case of the note, however, the journals used are the purchase and general journals.

Similar methods are employed, also, for handling the cash sale and the sale against a customer’s note.

=Columnar Analysis of Cash Receipts and Disbursements.=—As illustrated in the chapters on purchase and sales journals, additional money columns are often used for the purpose of analyzing the purchases and sales by departments or classes of commodities. A similar analysis of both the cash receipts and cash disbursements may aid in segregating certain classes of cash items and thus save labor in posting. Of cash receipts, two classes are usually more active than all others combined. More cash is received from cash sales and from customers on account than from any other source. Accordingly, two additional columns may be used with these headings. _All_ cash receipts must be entered in the Total, Bank, or Net Cash column, as it is variously termed, and then distributed into any special columns provided. Thus all “Cash Sales” would be extended, both in the Net Cash and in the Sales column, and all receipts from customers would be entered in the Net Cash and in the Accounts Receivable column.

In the case of cash disbursements, the number of columns depends upon the degree of analysis desired. At least two additional columns are frequently found, one for creditors and one for expenses. Where cash purchases are numerous they may be segregated, or where any particular _class_ of expense is of frequent occurrence it may be shown in a separate column. Where one ledger is used for customers, creditors, and general accounts, there is little gain in segregating customers and creditors by special columns in the cash book, except as a slight aid in posting. Where separate ledgers are used, it is important to have separate customers and creditors columns in the cash book, as will be shown later in connection with the subject of controlling

accounts. Illustration and explanation of the columnar cash book are given on pages 158 and 159.

=Cash Discounts Analyzed.=—Sales and purchase discounts are another class of transactions best handled through the cash book, although, strictly speaking, they are not cash transactions. When a customer buys goods on account, he is usually offered two bases of settlement, depending on the length of the credit term allowed. Thus, 2% off is frequently allowed if payment is made within 10 days; otherwise the full amount of the invoice must be paid. Because the vendor does not know, at the time of entry on his books, on which basis settlement will be made, he makes the charge at the full invoiced amount. If the customer takes advantage of the discount offered, he pays less than the amount at which his account stands debited, yet the vendor must credit his account for the full amount of the original charge, in order to cancel his entire claim against the customer. To illustrate, a customer buys $100 worth of merchandise, with 2% off if paid within 10 days. On the 10th day he pays $98. The sale entry would be:

(1) Customer 100.00 Sales 100.00

The cash entry would be:

(2) Cash 98.00 Customer 98.00

But this does not cancel in full the $100 claim against the customer. The $2 discount, an allowance for early payment, is an expense to the business and must be charged to an expense account called “Sales Discount,” and the customer must be given $2 additional credit, the entry being:

(3) Sales Discount 2.00 Customer 2.00

Entries (2) and (3) are usually combined in one as follows:

(4) Cash 98.00 Sales Discount 2.00 Customer 100.00

Entry (4) is known as a compound entry. If entry (2), which is the part involving cash, is made in the cash book, then the additional entry (3) will have to be made in the general journal because there is no cash element in it and theoretically nothing but cash should be recorded in the cash book.

=Handling Discounts in the Cash Book.=—This recording in two separate places of what is really one transaction has led to the introduction into the cash book of a non-cash column in order to bring the whole transaction together. The customer’s payment being a receipt of cash, the record must be made on the debit side of the cash book. Reference to entry (4) shows that Sales Discount is also a “debit.” Where the cash book is limited strictly to cash transactions, the cash debit record shows only the “credit” element of the entry. The use of a Sales Discount column on the debit side of the cash book for the sake of making a complete record in one place thus introduces an extraneous element, one out of harmony with the other entries made there. In posting, great care must be exercised not to transfer Sales Discount to the credit side of its ledger account but to the _debit_ side.

=Alternative Treatment for Cash Discounts.=—Sometimes another treatment of sales and purchase discounts in the cash book is met with. This treatment for sales discount is based on the fiction that the full amount of the original charge is received from the customer and that an immediate return is made to him of the amount of the discount. To use the example cited on page 155, the entries would be:

Cash 100.00 Customer 100.00

showing receipt of the full invoice price and therefore full credit to the customer; and

Sales Discount 2.00 Cash 2.00

representing the fictitious payment in cash of a discount on sales of $2. In the cash book these two entries would appear as follows:

Dr. CASH CASH Cr. ========== ========== Customer 100.00 Sales Discount 2.00

This method of entering discount on sales would have the same ultimate result in the ledger as the columnar method, but the objection to it is that it makes the cash book show more money received and paid out than has actually been the case, thus making it difficult to check the cash against the bank record of deposits and checks. Another objection is that by this method the cash book does not show in one place a full record of the transaction, since the two items are shown on opposite sides of the cash book. Moreover, these items are seldom on contiguous lines because one side of the cash book is often considerably “ahead” of the

other. Cash discount on purchases is sometimes handled by a similar unsatisfactory method.

The first method shown, requiring special discount and net columns on either side of the cash book, is the approved method.

=Illustration and Explanation of the Analytic Cash Receipts Journal.=—An example of a columnar cash book debit side is given (Form 12) for the purpose of illustrating some points in the discussion. It should be understood that there is little uniformity in the columnization of cash books. The needs of the business govern the ruling suitable in any given case. The illustration shown is therefore not presented as a standard form but is given only for the purpose of illustrating the method of analysis of cash receipts.

[Illustration: †This balance is taken from the credit side of the cash record appearing on page 159.

Form 12. Columnar Cash Book—Debit Side]

[Illustration: Form 13. Columnar Cash Book—Credit Side]

As shown in the illustration, all _actual cash receipts_ are entered in the Net Cash column, which in connection with the Sales Discount column comprises the total corresponding to the Total column of the other subsidiary journals when an analytic record is made. All items received from customers are entered in the Accounts Receivable column; but it is important to note that the _amount_ entered in that column is not the _actual cash receipt_ but the _full amount_ of the original charge to the customer. Sales discount, if any, is entered in the Sales Discount column, and the _net_ amount, the actual cash received from the customer, is the amount appearing in the Net Cash column. Cash sales are entered in the Cash Sales column and also in the Net Cash column. All other kinds of receipts are extended to the Sundry column.

In the ledger folio column, checks are placed for the individual cash sales entries, the posting usually being made from the summary in the sales journal, as explained a little later, or from the total of the Cash Sales column in the cash book if the other method is not employed. In the summary entry of the illustration, it is assumed that a Cash account is kept in the ledger. Hence “Cash, Dr.” is shown posted to ledger Cash account on page 4; and the total Sales Discount, also _debit_, on page 20. The student should note the method of showing the amount of cash received during the current week, this amount comprising the “Cash, Dr.” posting to the ledger Cash account. Of course, the itemized credits, except the cash sales, are posted to their respective accounts, as indicated in the ledger folio column.

The use of the Sundry column for extension of the miscellaneous items makes proof of the distribution possible. The sum of “Net Cash” and “Sales Discounts”—both debit items—must equal the sum of all the other columns.

=Handling Columnar Analysis of Cash Sales.=—If all sales, both cash and “on time,” are entered in the sales journal, the totals of these two classes of sales are posted to the ledger Sales account from the summary in the sales journal. In this case there is no need of a separate Cash Sales column in the cash book, because such a column would simply duplicate the Cash Sales entry in the sales journal. Needless to say, cash sales always appear in the Net Cash column of the cash book, because they are cash receipts, but the “Ledger Folio” must be checked.

Sometimes two sales accounts are kept in the ledger, one for cash and the other for “time” sales. Here, also, if there is a Cash Sales column in the sales journal, no posting of cash sales from the cash book is necessary. On the other hand, if cash sales are omitted from the sales journal, then the cash book should provide for a Cash Sales column and the posting must be made from the total of this column in the cash book.

=Illustration and Explanation of the Analytic Cash Disbursements Journal.=—The cash disbursements columnar record corresponding to the cash receipts shown above, would appear as in Form 13. As with cash receipts, the illustration is not presented as a standardized form but merely for the purpose of showing the method of analysis. Postings are made or omitted, and the same considerations govern the making and posting of the summary entry, as in cash receipts. Being few in number, cash purchases are not shown in a separate column. The treatment of discounts received on purchases is exactly parallel to that of sales discount.

Since all net cash appears in Net Cash column on either side of the cash book, the cash balance is found by taking the difference between these two columns. The two sides must be ruled up and closed on corresponding lines and as of the same date.

CHAPTER XX

=Matter Left for Record in the Journal.=—By the use of a cash receipts, a cash disbursements, a purchase, and a sales journal, four principal classes of transactions are taken out of the old-time journal and entered in separate books of record. If transactions of any other class are numerous enough to justify the use of a separate book of record, such a record should be set up. Although the number of subsidiary journals, each recording one kind of transaction, may become very large, nevertheless in practically all cases it is necessary to retain the general journal (often referred to simply as “the Journal”), in order to take care of such miscellaneous items as are not recorded in any of the special journals.

The standard form of journal was illustrated in Chapter XVI, where it was stated that a journal must provide space for date of entry, account classification, ledger folio index, debit and credit money columns, and explanation. As an explanation of the form, method of use, proper observance of margins, etc., was made there, it need not be repeated here.

=Kinds of Transactions Recorded in the Journal.=—When the number of subsidiary journals used is limited to the cash receipts, cash disbursements, purchase, and sales journals, as is frequently the case, all items not affecting these four books should be entered in “the Journal”; i.e., transactions involving notes receivable and notes payable; adjustments with customers and creditors resulting from return of goods or claims and allowances thereon; and all formal opening, adjusting, and closing entries. Furthermore, there is usually a number of other transactions, which because of their special and unusual nature cannot be grouped with the items of the special journals and must therefore be entered in the general journal.

=Journal Explanations.=—When these various classes of transactions are entered in the Journal, a very complete explanation should be given the entry. In fact, all entries covering settlements and adjustments with outsiders and within the business itself are of primary importance and the explanation should be so carefully worded as to make the intent of the entry plain and intelligible.

=Closing and Posting the Journal.=—No particular formality attaches to the closing and posting of the ordinary standard form of journal. There is no summary entry, no totaling, and there are no rulings to be made. Ordinary care must be exercised to see that the debits and credits are correctly posted. Since the entry in the Journal is given in its complete form and no debits or credits are suppressed, as is the case in the special journals, posting is not difficult.

=The Analytic Journal with Divided Columns.=—One form of the journal has its debit and credit columns separated, the debit money column appearing at the extreme left of the page, followed in order across the page by columns for date, account classification, ledger folio, and credit money amount. This kind of journal is called a divided or split-column journal and is ordinarily used to collect the totals to be posted to controlling accounts and thus to secure control over subsidiary ledgers. This matter will be fully discussed in later chapters. When the journal is so used it is provided with additional debit and credit analysis columns on each side according to the subsidiary ledgers employed. A divided-column journal with three debit and three credit columns is shown in Form 14. There is always a general money column on each side, the other columns depending on the kind of analysis required by the business.

[Illustration: Form 14. Divided Column Journal]

In the illustration referred to, an Accounts Receivable and an Accounts Payable column are provided. It is obvious that the Accounts Receivable column should usually appear on the credit side and the Accounts Payable column on the debit side; although in some cases provision is also made for an Accounts Receivable column on the debit and an Accounts Payable column on the credit side. The account of S. J. White, a customer, which is paid by his note, should be credited for the amount of $510.20 and consequently the item is extended to the Accounts Receivable column.

=Illustrations—Opening Entries.=—Illustration will be given of a few typical transactions requiring journal entry. The standard two-column journal will be used.

For the purpose of illustrating opening entries, assume the following data:

On September 30, 19—, Jack Gibson started in business, with the following assets and liabilities: Cash $3,500; Notes Receivable $800; Merchandise $4,000; Furniture and Fixtures $450; Accounts Receivable $2,100; Accounts Payable $1,500; and Notes Payable $1,200.

An analysis of this transaction shows that no part of it belongs to either the purchase or sales journals. The part relating to cash is entered in the cash receipts journal. However, in order to show the complete investment in one place, the entire transaction

including the cash part, is entered in the Journal and posted from there, with the exception of the cash item. The reason for this exception is that the cash investment is also entered in the cash book and will find its way to the ledger Cash account through the total cash debits at the end of the period. Because of this the cash item in the _Journal_ should be checked and not posted to the Cash account in the ledger.

Likewise, the investment item in the _cash book_, showing a credit of $3,500 to Jack Gibson, Capital account, should be checked and not posted to the credit of his account in the ledger because this item forms a part of the total investment of $8,150 posted to his credit from the Journal entry.

If the student has difficulty in determining the debits and credits of entries of this kind, it may be helpful to set up the data informally first, in the form of a balance sheet. Using this as a _guide_, he should then make his journal entry, debiting the asset items and crediting the liability and net worth items.

[Illustration]

[Illustration: Form 15. Opening Entries on Books]

The above entries bring the transaction completely on the books of original entry and show the ledger folios to which the various items are posted. Notice the check in the L. F. column in the Journal opposite “Cash” and in the cash book opposite “Jack Gibson, Capital,” which is inserted to prevent posting the same item twice.

For opening entries full explanation and details, where necessary, should be given in the Journal, covering lease agreements and contracts entered into when commencing business, and other similar data. It should be noted that with _opening_ entries it is customary for the explanation to precede the formal showing of debits and credits, rather than to follow it as in the case of all other journal entries.

=Adjusting and Closing Entries.=—Other typical entries to be illustrated are those made at the close of a fiscal period: (1) to adjust the books in accordance with certain data that were not obtainable before; (2) to transfer all temporary proprietorship accounts to the summary account, Profit and Loss; and (3) to transfer the net profit, i.e., the balance of the Profit and Loss account, to the proprietor’s personal account, and the balance of this latter account to the proprietor’s capital account.

The debits and credits of the entries necessary to effect the record of the data and transfers mentioned, can be determined as in the operations with ledger accounts previously shown.

The following data relate to Jack Gibson’s business and are given to illustrate the three classes of entries mentioned above:

During the year, sales amounted to $33,000; purchases to $25,000; selling expenses to $3,500; and general administrative expenses to $2,025. It is estimated that of outstanding accounts $350 are uncollectible; that furniture and fixtures have depreciated in value $45. Merchandise inventory shows $5,000 on hand. Gibson drew $1,000 during the year.

The first thing necessary is to make the adjustments on account of depreciation, bad debts estimate, and present inventory. These adjustment entries are made in the Journal as follows:

19— Sept. 30 Depreciation 20 45.00 Depreciation Reserve Furniture and Fixtures 6 45.00 To bring on the books the expense due to estimated depreciation and to effect the proper valuation of Furniture and Fixtures. Bad Debts 21 350.00 Reserve for Doubtful Accounts 3 350.00 To bring on the books the expense due to estimated loss from uncollectible accounts. Purchases 16 4,000.00 Merchandise Inventory 4 4,000.00 To transfer the goods on hand at the beginning of the year to Purchases. Merchandise Inventory 4 5,000.00 Purchases 16 5,000.00 To transfer the inventory of merchandise now on hand to Merchandise Inventory account.

The first two entries, when posted, will bring on the book valuation accounts for furniture and fixtures and accounts receivable, and will set up the expense accounts, Depreciation and Bad Debts. The third Journal entry, when posted, will transfer the goods on hand at the beginning of the year so that they can be added to the Purchases made during the year. In this connection it will be remembered that the sum of these two items, old inventory plus purchases during the year, constitutes the primary factor of “cost of goods to be accounted for.” The fourth entry shows the asset Merchandise now on hand and, by its credit to Purchases, effects a subtraction from Purchases, so that the balance of Purchases, $24,000, shows the “cost of goods sold.”

The books are now adjusted and ready for summarization by means of the Profit and Loss account. The following Journal entries, transferring all temporary proprietorship items to the Profit and Loss account, will effect the closing operation:

19— Sept. 30 Sales 15 33,000.00 Profit and Loss 14 33,000.00 To close. Profit and Loss 14 29,920.00 Purchases 16 24,000.00 Selling Expense 18 3,500.00 General Administrative Expense 19 2,025.00 Bad Debts 21 350.00 Depreciation 20 45.00 To close. 29,920.00 Profit and Loss 14 3,080.00 Jack Gibson, Personal 11 3,080.00 To transfer net profit for the year. Jack Gibson, Personal 11 2,080.00 Jack Gibson, Capital 10 2,080.00 To transfer the portion of the year's net gain left in the business.

The first entry transfers the sales income to the credit of Profit and Loss. The second entry charges the Profit and Loss account with the cost of goods sold and all other expenses for the fiscal year. When the posting has been completed up to this point, the balance of the Profit and Loss account shows a net gain of $3,080, which, belonging to the proprietor, is transferred to the credit of his personal account, as shown by the third entry. He has drawn against prospective profits to the extent of $1,000, leaving $2,080 of profit remaining in the business as an addition to his permanent investment. Hence, this balance is transferred to Gibson's capital account by the fourth entry.

=Objection to the Direct Ledger Method of Adjusting and Closing the Books.=—These adjustment and closing transactions are sometimes recorded directly in the ledger without first entering them in the Journal. Usually this is not satisfactory because it does not show in one place a complete record of all the adjustment and closing summaries necessary at the close of a fiscal period. These summaries are matters of sufficient concern to the business to warrant their entry in the Journal where full and complete explanations can be given. The more complex entries often needed to adjust and close the books of a business where numerous income and expense accounts are kept, follow the same general principles as those discussed above. Adjusting and closing entries are given fuller treatment in Chapters XXVII and XXVIII.

The two illustrations given above cover certain types of Journal entries which are of a more difficult character than the customary purchases, sales, and cash entries. A keen analysis is often required to formulate the debits and credits of these entries, and the explanatory matter should be worded with sufficient care to render them intelligible even after the immediate interest in them has been lost and their recording ink has become "cold."

=Entries Affecting Several Journals.=—Transactions sometimes require entry in two or more journals. A basic principle of bookkeeping is that there should be no duplication of entry in the various journals. A transaction that can be completely entered in one journal should not be entered in any other journal. The one exception to this principle is made in the case of an investment transaction, as explained on page 171. Sometimes, however, there may be a conflict of places of entry, as in the case of cash purchases and sales, already explained, where entry is made in both journals in order to allow each journal to perform its proper function. Two examples will illustrate the proper method of handling such transactions.

PROBLEM 1. Assume that a customer, James Robbins, buys $1,000 worth of goods, paying $300 cash, giving a note for $500 and leaving the balance on open account.

The following entries should be made:

(a) James Robbins 1,000.00 Sales 1,000.00 (b) Cash 300.00 James Robbins 300.00 (c) Notes Receivable 500.00 James Robbins 500.00

It will be noted that three journals are involved. Entry (a) is recorded in the sales journal; entry (b) in the cash receipts journal; and entry (c) in the general journal. The net effect of the three entries is:

James Robbins 200.00 Cash 300.00 Notes Receivable 500.00 Sales 1,000.00

Because special journals are used, however, the transaction must be split up as indicated above.

PROBLEM 2. Assume that the business purchases from the Investment Trust Co. a building site valued at $5,000, paying for it $2,000 cash and a note for the balance supported by a mortgage.

Two methods are used to record this transaction, neither having any special advantage over the other.

FIRST METHOD: (a) Land 2,000.00 Cash 2,000.00 (b) Land 3,000.00 Mortgage Notes Payable 3,000.00

Entry (a) is made in the cash disbursements journal, and entry (b) in the general journal. This method of entry requires the splitting of the land value into two parts and breaks up what is really a unit transaction by recording it in two places. Because of this, the general journal portion of the entry should be followed by a very full explanation of the _entire_ transaction, in which reference to

the partial cash payment should be made. In the cash disbursements journal the only explanation needed will be a reference to the general journal entry.

SECOND METHOD.—To bring about a complete record of the land item in one place, the following method is often used:

(a) Land 5,000.00 Investment Trust Co. 5,000.00 (b) Investment Trust Co. 2,000.00 Cash 2,000.00 (c) Investment Trust Co. 3,000.00 Mortgage Notes Payable 3,000.00

Entry (a) in the general journal sets up an account with the vendor, the Investment Trust Co. Entry (b) in the cash disbursements journal and entry (c) in the general journal show the cancellation of the liability to the vendor through the payment of cash in the one case and the giving of a mortgage in the other. The net effect of the entries is:

Land 5,000.00 Cash 2,000.00 Mortgage Notes Payable 3,000.00

It will be noted that this method sets up a formal account with the vendor—a desirable thing—but that it requires one more entry than the first method.

The other entries recorded in the Journal ought not to give the student any particular difficulty.

CHAPTER XXI

BUSINESS PAPERS—NEGOTIABLE INSTRUMENTS

The books of original entry, i.e., the journals, having been explained, the attention of the student will be directed next to the sources of information on which the entries in the various journals depend. Accordingly, some of the important papers and methods used in business will be discussed, after which further accounting principles and methods will be given adequate treatment.

=Use of the Note Receivable.=—The purpose of sales is the ultimate conversion of stock-in-trade into cash to provide for the payment of services and for the purchase of commodities for future sale. This conversion of stock-in-trade into money may be immediate, as when goods are sold for cash, or deferred, as when goods are sold on account. In the latter case the conversion is indirect, because the charge against the customer must be collected before conversion is complete.

Frequently the “note receivable” acts as an intermediate step in the process of converting stock-in-trade into cash. It is an instrument in which the customer formally promises to pay his debt at a fixed time in the future. The kind of claim represented by a note receivable is, legally, different from the open account claim; generally speaking, a note is considered _a better_ claim than an open account. This is because the note implies a prima facie acknowledgment of the correctness of the original charge, and in event of suit relieves the holder from proving the original items of the claim.

Accordingly, when a promissory note is received from a customer, the open account claim against him ceases to exist and a different kind of claim evidenced by his promissory note is acquired. Therefore the open account is credited to show cancellation of the original charge, and Notes Receivable is debited to show the new claim. It may be well to remark here that the same instrument which is a _note receivable_ to the vendor is a _note payable_ to the customer.

In some businesses, it is the policy to encourage customers to give notes. In such cases it is often advantageous, particularly for the credit information shown, to set up the note transactions with each customer under individual names, e.g., “John Doe, Notes Receivable.” Such a title plainly indicates the nature of the items listed under it; viz., claims against John Doe, witnessed by his promissory notes. As a general rule, however, the notes received from any one customer or all customers are usually relatively small in number and for this reason they are for the most part brought together under one class title, Notes Receivable.

=Negotiable Instruments—Their Use and Requisites.=—Notes receivable belong to a class of business papers termed negotiable instruments, the distinctive feature of which is that in many ways and for many purposes they _take the place of money_. The negotiable instrument, usually of small size but often representing a large sum of money, is used in the commerce of the world as a _medium of exchange_, in place of heavy and bulky coin or valuable bank notes which when lost or stolen can be passed as currency.

From a legal standpoint a negotiable instrument is one which gives a bona fide holder an absolute right to it, whether the preceding holder had acquired it lawfully or not. It is in this respect distinguished from other objects of value, as a horse, for example, the

present possessor of which is the legal owner only if he acquired it in good faith from one who in turn had acquired it lawfully.

To be negotiable, an instrument must have the following requisites:

1. It must be in writing and signed by the maker or drawer.

2. It must contain an unconditional promise or order to pay a fixed sum of money—and the payment must be made in legal tender.

3. It must be payable on demand or at a time which is either fixed or can be determined.

4. It must be payable to bearer or to order.

=Negotiable Instruments—Kinds and Definitions.=—Any formal or informal written promise to pay possessing these essentials is a negotiable instrument. Examples are: promissory notes—notes receivable and notes payable—drafts, checks, money orders and, with certain restrictions, warehouse receipts.

A promissory note may be defined as an unconditional promise to pay a specified sum of money at a certain time. It usually has a form similar to the following:

[Illustration: Form 16. Promissory Note]

=The Draft.=—A draft is a written order by one party on a second party to pay to a third party the amount of money named. To be negotiable, it must be so drawn as to meet the requirements of negotiability named above. A draft may have a form similar to the following:

[Illustration: Form 17. A Draft]

It will be noticed that there are three parties to a draft—the drawer, the drawee, and the payee. The drawer is the person who draws the draft and whose signature appears at the lower right-hand corner of the draft. The drawee is the person on whom the draft is drawn, George S. Perkins, above. He is sometimes called the payer. The payee is the person who is to receive the payment ordered, James Stanley Jackson & Co.

To understand the use of the draft as an instrument of business, suppose the following relations exist between the three parties named above:

1. George S. Perkins bought goods from Bert V. Robbins on account for $175.

2. Robbins bought goods from James Stanley Jackson & Co. to the amount of $125.75 on account.

The problem will be discussed from the standpoint of Bert V. Robbins. From the above data it is clear that Robbins has a claim against Perkins for $175 and owes $125.75 to Jackson & Co. Instead of collecting the claim against the former and paying his debt to the latter, he writes out a draft for $125.75 on Perkins, with Jackson & Co. as payee, thereby requesting (or ordering) Perkins to pay $125.75 to Jackson & Co. This draft he sends to Jackson & Co. and they present it through their bankers to Perkins. Under ordinary circumstances Perkins acknowledges the correctness of the draft and writes his acceptance _on the face of it_, thereby promising to pay the amount when due. Acceptances are usually worded in the following manner:

Accepted, Oct. 6, 19— Payable at First National Bank of Providence GEORGE S. PERKINS

It should be said that the three-party draft is not usually made use of without the consent of the drawee previously obtained, as in the case of a bank check, which is a draft on the bank drawn by the depositor. Very often in ordinary drafts, particularly when drawn against an export of goods, the drawer makes out the draft in favor of himself and indorses it in blank, thus making it transferable to bearer.

=The Accepted Draft.=—When accepted, the draft becomes, to all intents and purposes, an ordinary promissory note—Perkins' promise to pay Jackson & Co. $125.75. Until the draft is accepted by Perkins, it simply constitutes a request from Robbins to Perkins to pay the amount named and the draft as such does not bind Perkins in any way. Hence, no entry is made on the books of account of any of the three parties until acceptance. Of course, a memorandum is kept of all drafts drawn.

=Illustrative Entries.=—Upon acceptance by Perkins, the following entries are made:

1. On the books of Jackson & Co., the payee:

Notes Receivable 125.75 Bert V. Robbins 125.75 Robbins' draft on G. S. Perkins, accepted by Perkins, payable December 5.

Perkins' acceptance, in possession of Jackson & Co., constitutes a claim against Perkins, and Jackson & Co. therefore debit Notes Receivable. They credit Robbins because this draft was sent to them by Robbins in payment of Jackson's open claim against Robbins for $125.75.

2. On the books of Perkins, the drawee:

Bert V. Robbins 125.75 Notes Payable 125.75 Accepted Robbins' draft at 60 days' sight, favor of J. S. Jackson & Co.

This entry cancels Perkins' liability on open account to Robbins, and shows as a substitution therefor the amount of his acceptance in favor of Jackson & Co. at Robbins' request.

3. On the books of Robbins, the drawer:

James Stanley Jackson & Co. 125.75 George S. Perkins 125.75 To record the cancellation of our liability to Jackson & Co. on open account, and to credit Perkins with his acceptance of our draft on him at 60 days' sight.

From the point of view of Bert V. Robbins, the acceptance by Perkins means two things: (1) the cancellation of a part of Robbins' claim against Perkins, and for this reason Robbins credits Perkins with $125.75; (2) the cancellation of Robbins' debt to Jackson & Co., hence Jackson & Co. is debited on Robbins' books for $125.75.

It is important to note here that in case Perkins fails to pay the note at maturity, Robbins becomes liable to Jackson & Co. Robbins may therefore be considered the first indorser of the accepted draft. The discussion of the manner of booking Robbins' liability contingent upon Perkins' failure to pay is deferred to Chapter XLIII.

=Entries After Payment of the Draft.=—Upon payment by Perkins, the following entries are made:

1. On Perkins' books, a debit to Notes Payable and a credit to Cash.

2. On Jackson & Co.'s books, a debit to Cash and a credit to Notes Receivable.

=Draft and Cash Compared as Instruments of Payment.=—The following two diagrams may further illustrate the utility of the draft as an instrument of trade.

1. Showing the settlement of the several claims in _cash_—in case Robbins had collected $125.75 from Perkins and had paid $125.75 to Jackson & Co., the payments being made independently in each case:

[Illustration]

2. Showing a settlement by draft—a clearing house method:

[Illustration]

The commercial, three-party draft is little used now. With the larger function of banks in the conduct of modern business, other kinds of drafts as discussed below have come into use. The three-party relationship is the basis of all draft transactions, however, and must therefore be thoroughly understood.

=Classification of Drafts.=—There are several kinds of drafts, which may be either sight or time instruments. A draft drawn "at sight" is a request on the drawee to pay at sight, i.e., immediately upon presentation to him. The use of the sight draft in making collections is quite common. A delinquent customer is drawn on at sight and collection is attempted through the bank. The method is oftentimes effective because refusal to pay may reflect on the drawee's credit with his own bank. Usually no formal book entry is made of such drafts until paid. A draft drawn, say, "at 60 days' (or 30 days') sight" is a request to pay 60 (or 30) days after presentation. Hence, the dating of the acceptance of such a draft is of prime importance. Such a draft is, of course, a time draft.

A draft drawn "60 (or other number) days after _date_" is called a date draft and is payable 60 days from the date of the instrument—not, as in the first case, 60 days after presentation or acceptance. It also is a time draft. It is not necessary, although customary, to present time drafts for acceptance.

Drafts may be “commercial” or “bank” according as the drawee is a merchant or a bank, respectively. B. V. Robbins’ draft on Perkins shown above is a merchant’s draft. A bank draft is a request by one bank on a correspondent bank to pay a given amount of money to a named payee. A customary method of remitting money is by the purchase and remittance of a bank draft, for the issuing of which banks usually charge a fraction of a per cent. To illustrate its use, take the following situation:

L. W. Roberts of Denver owes Field & Co. of Chicago $210 on account. Roberts goes to his Denver banker and buys a bank draft which may read as follows:

[Illustration: Form 18. A Bank Draft]

Before sending this draft to Field & Co., Roberts indorses it in favor of Field & Co., who upon its receipt deposit it with their own bank and through it secure its collection from the Second National Bank. Roberts pays his bank for the draft $210 plus exchange.

Drafts may be foreign or domestic. They are domestic when they are drawn and payable within the same state or country; otherwise they are foreign. According to the present usage, the term “draft” is used whenever the parties concerned live within the United States, although they may reside in different states, and the term “bill of exchange” is applied to all such instruments where some of the parties live abroad.

=The Trade Acceptance.=—The Federal Reserve Board defines a trade acceptance as “a bill of exchange drawn by the seller on the purchaser of goods sold and accepted by such purchaser.” The chief characteristic of this document as contrasted with the ordinary draft is the showing on its face of the origin of the transaction giving rise to the draft, usually by means of the following statement: “The obligation of the acceptor hereof arises out of the purchase of goods from the drawer.” The following requirements to make a trade acceptance eligible for rediscount by the federal reserve banks have been laid down by the Federal Reserve Board:

1. It must have arisen out of an actual commercial transaction, usually the purchase and sale of commodities.

2. It must have been drawn under a credit opened for the purpose of conducting or settling accounts resulting from business transactions involving the shipment or storage of goods.

3. At the time of presentation to a federal reserve bank for discount or as collateral for the loan of money, it must have a maturity of not more than three months exclusive of days of grace.

Trade acceptances are promissory notes just as are any other accepted drafts. Because they comprise a very liquid asset, it is not unusual to record them in an account, Trade Acceptances, and so distinguish them from other notes and drafts. If they are few in number, they are more usually recorded as Notes Receivable.

=Checks.=—A check is a draft on a depositary bank. It is an individual’s order to his bank of deposit to pay a named or designated payee a certain sum of money. Two illustrations are given below, somewhat different in form but identical in nature. In the first, likeness of the check to a draft is very evident.

[Illustration: Form 19. Forms of Checks]

The _certified check_ is usually an individual’s or firm’s check bearing the certification of the bank’s cashier that the check is good. This certification is evidenced by writing across the face of the check these or similar words:

Good when properly indorsed FIRST NATIONAL BANK F. G. MOFFITT, CASHIER

Such a certification makes the bank responsible for its payment.

A cashier’s check is a bank’s own check drawn on itself in favor of a third party and signed by its cashier. As a medium of exchange it ranks higher than the check of a private person, due to the superior credit of the bank and to the fact that the bank is usually more generally known in a community.

=Other Negotiable Instruments.=—_Express_ and _postal money orders_ are drafts payable at sight, drawn respectively by one express agent on another and by one postmaster on another.

A warehouse receipt is a receipt from a warehouse, elevator, or other storage concern acknowledging the receipt of goods or property. Such a receipt usually contains the contract agreements entered into by the parties, covering the conditions according to

which the goods are accepted for storage. The warehouse receipt is usually negotiable, or partially so, in that title to the property may pass with its transfer.

=Principles Governing the Writing of Commercial Paper.=—Ordinary prudence requires commercial paper to be drawn in a way that will make forgery difficult if not impossible. To this end the following two rules should be observed:

1. Leave no blank spaces, particularly where the amount is written. This is not so important when the amount is perforated, with a perforated star at each side.

2. Write the indorsement at the top margin. Unless this is done, some statement might be inserted which would change materially the effect of the signature; e.g., the payer might later write above the signature that the check is accepted in full payment for a definite bill.

=Kinds of Indorsement.=—An indorsement is usually for the purpose of transferring title. There are several kinds of indorsement, as follows:

1. A _blank_ indorsement, which consists only of the payee's signature; this renders the instrument payable to bearer.

2. A _full_ indorsement, which reads as follows: "Pay to the order of .....," giving the name of the indorsee, i.e., the person to whom the instrument is transferred, and followed by the signature of the indorser, who before his indorsement was the payee.

3. A _qualified_ indorsement, which is either a blank or full indorsement with the words "without recourse" added to it. This kind of indorsement transfers title with no liability attaching to the transferor in case of non-payment by the maker at maturity.

4. A _restrictive_ indorsement, giving the name of the party to whom the check is transferred, the words "for collection" or "for collection and deposit" being added and followed by the signature. This indorsement does not transfer title but merely appoints the person or bank named as agent for the purpose of collection.

CHAPTER XXII

BUSINESS PAPERS—THE GOODS INVOICE AND BILL OF LADING

=Definition.=—When a business transaction takes place, a record or memorandum of its amount and nature is usually made out. Thus, the amount of cash received for a sale may be rung up on the cash register or a sales clerk may make out a duplicate sales ticket and turn over the carbon copy as a sales memorandum to the bookkeeper; for cash disbursed a receipt, to be the basis for formal entry on the books, may be demanded from the person to whom the payment is made.

These memoranda of business transactions are called "business papers." They comprise all of the more or less formal and informal documents which constitute the firsthand evidence of most transactions. Among the most common business papers may be mentioned: the goods invoice for purchases or sales; negotiable paper, including the check, note, draft, money order, and warehouse receipt; the statement and account sales; the shipping order and bill of lading; the bill of sale; the lease agreement; and contracts of all sorts. A few of the business papers most frequently used will be explained.

=The Invoice.=—When a merchant sells goods to a customer he writes out an itemized "bill" which is sent along with the goods. This bill, loosely called an "invoice," is from the seller's viewpoint more accurately described as a sales invoice, and from the customer's or buyer's viewpoint as a purchase invoice. It is an itemized statement of goods bought or sold, and should state the names of vendor and vendee, the address of the vendor and the date of sale, the quantities, kinds, and prices of the goods, the terms of sale, and additional information as to method of shipment, etc.

=Handling the Purchase Invoice.=—When goods are bought the purchase invoice should be verified or audited. The method of audit depends upon the organization of the business. In a small business, if the invoice is received before arrival of the goods, it is usually held till their arrival and then checked against them as to quantities, quality, and price. The extensions and total are verified and entry made in the purchase journal, using the audited invoice as a basis. The invoice should then be placed in a temporary file till paid, after which it is usually filed under the vendor's name for future reference. The check in payment of the invoice, when returned canceled by the bank, is frequently attached to the invoice for which it was issued as evidence of its settlement. At any rate the paid invoice should bear on its face a notation to show the payment.

In a large business where the clerical work is divided among departments, several copies of the original purchase order sent to the vendor are usually made out—one copy, for instance, for the purchasing department, one for the receiving room, one for the auditing department and so on. The procedure of auditing is then more complex. The copy furnished the receiving room is usually left blank as to quantities, and sometimes the description of the goods ordered is also omitted. When the goods are received, quantities and kinds are filled in by the receiving department, and the copy is sent to the auditing department where it is checked against the auditor's copy of the original order and the purchase invoice from the vendor. If found correct as to quantity, kinds of goods, extensions, and additions, the invoice becomes the basis for entry in the purchase record—journal or voucher register as the case may be—after which it follows the customary routine as to filing. The invoice remains in a temporary file as long as it is unpaid. Upon payment it is placed in a permanent file, either under the name of the vendor, by invoice number, or according to whatever system may be in use.

=Handling the Sales Invoice.=—Practically all systems of handling sales require that at the time of the sale some record or memo of the transaction be made. In retail establishments the use by each salesman of a book of sales tickets with provision for duplicate or triplicate impression is very general, whether the sale be cash or charge. The cash and charge tickets are usually put up in separate books and a different color of paper is used for each. At the close of the day the total cash tickets are checked against the cash received from cash sales, and the total charge tickets give a controlling figure for charges to customers. The total of the cash tickets plus that of the charge tickets gives the total credit to Sales.

These sales tickets are usually entered on a daily sales sheet provided with distributive columns for analysis according to departments or kinds of commodities. A recapitulation giving the totals of each of these columns is made and posted to the ledger, while the customers ledger accounts may receive their charges direct from the sales ticket. This recapitulation really constitutes the sales journal record, as is explained in Chapter XLVII.

Where the number of charge accounts is not large, a folder system is sometimes used. Each charge sales ticket is placed in the folder which takes the place of that customer's account, thus avoiding the necessity of making a formal entry on the ledger. When the customer pays this bill, the sales ticket is so marked and is either left in the folder or transferred to a permanent file. The successful operation of the folder system presupposes that the customer will pay the exact amount of his bills shortly after the date of the ticket, no provision being made to care for overlapping credits. Whatever the system, the sales ticket is the original record of the transaction and therefore valuable as evidence in case of dispute. These tickets should be filed away and kept until all danger of dispute is past.

=Credits and Returned Goods Invoices.=—If for any reason goods purchased prove unsatisfactory and are returned, record of their return should be kept by the shipping clerk and used as a basis for securing proper credit from the vendor. The vendor usually sends a returned goods invoice, which, though similar in form to the purchase invoice, constitutes a _credit_ to the purchaser instead of a charge. These credit memos, as they are termed, are always of some distinctive color, frequently red, in order to distinguish them readily from the regular invoice.

Similarly, when dissatisfied customers return goods, or when the business makes them an allowance on goods sold, a credit invoice or credit memo is sent them and the duplicate copy of this memo retained in the office becomes the basis for entering the transaction on the books.

=Shipping Goods—The Bill of Lading.=—The purchase and sale of goods usually involve dealings with railroads. It is not the purpose of this chapter to give an extensive system or method of handling shipments, but merely to explain the purpose of the railroad documents and their use as business papers.

A shipment of goods is evidenced always by a "bill of lading," a contract under which the railroad accepts freight for carriage, defines its liabilities as a transportation company or warehouseman, and states its duties and those of the shipper. Its standard content is prescribed by the Interstate Commerce Commission, although any additions to it not in conflict with the standard content are not forbidden. If the shipper so desires, he may have bills of lading printed to conform in size with his own files, instead of using those furnished by the railroad. There are two standard forms, the _straight_ bill of lading which is not negotiable and the _order_ bill of lading which is negotiable.

The bill of lading is always made out in triplicate, the original and the two copies being identical except as to titles and signatures. The original is signed by the shipper and the railway agent, and constitutes the shipper's receipt for the goods delivered to the railroad. The second copy called the "shipping order," is signed by the shipper only. It is his order to the railroad to ship the goods,

and is held by the railroad as evidence of its authority. The third copy or memo is an exact duplicate of the original. Like the first copy, it is signed by the shipper and the agent, and is held by the shipper as a duplicate receipt. Sometimes it is forwarded with the invoice to the customer, but otherwise should be filed by the shipper with the original bill of lading. In case of claim against the railroad for loss or damage to goods in transit, the original bill of lading is required as evidence and should therefore always be kept in the shipper's possession.

=Freight Notice and Expense Bill.=—A notice, called "freight notice," is sent by the railroad to the consignee upon arrival of the goods. A more or less formal order is given by the consignee to the teamster or drayage company to call for the freight. This order authorizes the railroad to deliver it to the teamster or drayage company. Upon its delivery, an "expense" or freight bill is sent to the consignee itemizing the freight charges due on the shipment. The freight notice and the freight bill are usually made at one impression, the heading on the one being a notice of the arrival of freight, while on the other the heading is that of an ordinary invoice or bill showing the freight charges on the designated goods. Some railroads make three copies at one impression, consisting of (1) the freight notice, (2) the delivery receipt, and (3) the freight bill. Copy (2) is a receipt surrendered by the consignee upon delivery of the goods.

=C. O. D. Shipments.=—C. O. D. shipments are handled through the agency of an express company, the post-office, or a bank. Express companies accept for shipment freight which is to be paid for upon delivery, agreeing to collect and remit the amount of the invoice to the consignor less collection and remittance charges. This method of shipping sometimes gives the consignee the privilege of examination before acceptance. It is used with customers who are unknown to the shipper or with those whose credit is doubtful.

When the parcels post service is used for shipping goods C. O. D., the post-office makes the collection for the shipper. The shipper must, of course, always prepay the postage, although this may by agreement become a charge against the customer.

When a bank is made the shipper's agent to collect on delivery, a draft is drawn on the consignee and sent to the bank along with a special C. O. D. bill of lading, the _order_ bill referred to above. This original C. O. D. bill together with the attached draft is sent by the bank to its correspondent located in the same city as the consignee. The correspondent bank presents the draft to the consignee for acceptance or payment, as the case may be, and thereupon delivers the special bill of lading to him. The shipper's order to the railroad provides that the goods are to be delivered only upon presentation by the consignee of this special bill of lading. In the use of the order bill of lading, it is customary for the original copy to show the goods consigned to the order of the shipper himself. This copy, indorsed by the shipper, and the attached draft are the documents used by the bank in making the collection.

=Duties of the Traffic Department.=—In a large business a special department known as the traffic department is authorized to handle all shipments. Briefly, its duties are to look after all incoming freight, its receipt in good condition and its proper distribution to the several departments; to handle all outgoing freight, its proper routing so as to secure lowest tariffs and speedy delivery; and to secure the adjustment of claims for damage or loss of goods in transit.

=The Statement of Account.=—When goods are sold, an invoice or bill showing terms of sale, quantities, items, prices, and total amount of sale is sent to the customer. Periodically, frequently the last of the month, a statement is rendered each customer whose account shows a debit balance. Frequently the date of sending the statement is recorded in the explanation column of the ledger account, which, from a credit point of view, is a desirable practice.

The statement of account is a transcript, sometimes a summary, of the customer's ledger account, i.e., it contains all charges and all credits for the period covered. If there is a balance outstanding at the beginning of the month, the current statement opens with the balance item and is followed by lists of all charges, payments, and other credits for the current period; the total credits are subtracted from the total charges and the balance constitutes the amount now due and owing. Sometimes a statement of account is made out in detail, giving a copy of the original invoices which evidence the several sales transactions. Statements of account are issued in many different forms, but the following illustration shows all the essentials:

[Illustration: Form 20. Monthly Statement of Account]

CHAPTER XXIII

BANKS AND THEIR METHODS

=Service of the Bank to the Community.=—Practically all business houses at the present time take advantage of the banking facilities to be found in every community where there is enough business transacted to justify the establishment of a bank. A bank is sometimes defined as an institution which deals in money and credit. One of its chief functions and the one on which its main income is _based_ is that of acting as a place for the deposit of moneys, these deposits forming the basis for its loans and discounts. Among its other important functions and services are to collect drafts and checks drawn on other banks; to issue and sell its own drafts on other banks, thereby enabling its customers to make payments to out-of-town creditors; to discount commercial paper, i.e., to loan money to its patrons on approved security; and to issue paper currency.

=Opening an Account with the Bank.=—Because so much of the bank's business is based on the honor and integrity of its customers, a prospective depositor is usually required to present a card of introduction signed by a customer of the bank or someone else known to it. A depositor who wishes to open a checking account is asked to file a "signature" card bearing the signatures which he will use in signing checks. As considerable expense attaches to handling depositors' accounts, some banks require that the balance of the account shall never fall below a fixed minimum.

=The Deposit Ticket.=—When an account is opened, the depositor is provided with a pass-book and check book. All deposits are made by means of deposit tickets, discount memoranda, or collection notices. The deposit ticket is in form similar to the following:

[Illustration: Form 21. Bank Deposit Ticket]

All moneys and checks deposited are listed on this ticket under the indicated classifications. The deposit is handed to the receiving teller of the bank, who, after verifying the ticket, makes an entry of the amount in the depositor's pass-book. Duplicate deposit tickets are usually kept by the depositor. It is important to note that checks must be indorsed before they are deposited, so as to make them collectible by the bank.

=The Pass-Book.=—The pass-book is the record of the depositor's dealings with his bank and, although written up by the bank teller, it is usually kept from the depositor's viewpoint, i.e., the bank is debited with all deposits and credited with all checks presented for payment. At stated intervals, say monthly, the book is left with the bank for balancing, at which time the _total_ amount of checks paid by the bank is entered in the pass-book and the canceled checks are returned to the depositor. Sometimes the pass-book is kept in account form, the left page indicating deposits, and the right page payments by the bank. More frequently, however, the pages of the pass-book do not have debit and credit significance but constitute a continuous record. In this case, at the end of the period, the deposits are footed and the total of the checks is _subtracted_ from the total deposits, thus showing the balance due the depositor.

A method coming into quite general use among banks is to send a monthly statement of account just as trading concerns do. This statement is a transcript of the bank's ledger account kept with each depositor, showing deposits and withdrawals. When this is done, withdrawals are not entered on the pass-book, which thus serves only as a memo or receipt of the moneys deposited.

=The Check Book.=—The check book is provided either with a stub, counterfoil, or interleaf, for making a duplicate record of the check drawn. Provision is usually made in the check book for the entry of the deposits. Sometimes each check is subtracted from the previous balance and the amount of the new balance shown; more often, total checks and total deposits are shown separately and in this way, while it is an easy matter to find the balance by subtracting the total checks from the total deposits, the actual figure does not appear and hence is not available to curious eyes.

The balance shown in the monthly statement or by the periodic balance of the pass-book is seldom the same as that shown in the depositor's check book, due to the fact that certain checks issued by the depositor have not yet been presented for payment to the bank. The method of reconciling the pass-book with the bank balance is treated in Chapter L, "Accounts Current."

=Securing a Loan through the Discount of a Note.=—A common practice of business men in borrowing money is to discount or sell to their bank or to a broker their own promissory notes and those received from customers. When merchants discount their own notes at a bank, the notes bear only one signature, that of the merchant, and for this reason they are called "one-name" paper. If a merchant receives a note from a customer, indorses it, and then discounts it at the bank, two signatures appear on it—that of the original maker and that of the indorser. Notes of this kind are called "two-name" paper. Banks usually prefer two-name paper because, if the maker fails to pay the note at maturity, the indorser can be held liable for its payment, while in the case of one-name paper the bank has recourse to no one except the maker.

When a merchant makes out a promissory note of, say, $1,000 due 90 days after date, and discounts it at his bank, the bank usually deducts interest at, say, 6%, from the face of the note; i.e., the merchant is credited not for the full $1,000 but only for $985, and when the note matures he either pays the amount, $1,000, or his account is debited with it. The $15 is called “discount” because it is “subtracted” from the face of the note; but since this item is paid for the use of the amount loaned by the bank, it is of the same nature as interest. There is no reason, therefore, for keeping two separate ledger accounts, one for discount and one for interest paid, the two usually being combined under one title, “Interest and Discount” or “Interest.”

=Principles to be Observed in the Calculation of Interest.=—In connection with interest computations it is important to observe the following points, the principles involved in each case being best explained by making use of suitable illustrations.

1. In commercial practice, when the interest period is expressed in months, the interest for each month is one-twelfth of the annual interest, i.e., a note for $1,000 dated April 11, 19—, due “three months from date,” matures July 11 and the interest at 6% is 6% of $1,000 divided by 12 multiplied by 3, or

$1,000 × .06 × 3 ---------- = $15 12

2. Were the same note worded “ninety days from date,” it would mature _July 10_ instead of July 11, the number of intervening days being 19 in April, 31 in May, 30 in June, and 10 in July; total 90 days. The interest would amount to

$1,000 × .06 × 90 ---------- = $15 360

3. If a note is dated March 6, 19—, and matures, say, on April 30, the interest period is 55 days (25 in March and 30 in April). Usually, in computing the number of days in the interest period the opening date is omitted but the closing date is included. In some instances the practice is to include both days.

It is important to note that it is almost a universal custom to use 360 as a denominator in all these cases, although the theoretically correct number is 365. This is done for the reason that the use of 360 greatly facilitates the computation. The government of the United States makes an exception to this rule and counts the year as 365 days, and disregards the month as a unit base; i.e., instead of counting the month of January as $^{1}/_{12}$ of a year, its computation requires the use of the fraction $^{31}/_{365}$ as the multiplier. Interest on $1,000 for, say, 12 days, by this method, amounts to

$1,000 × .06 × 12 ---------- = $1.97 365

instead of

$1,000 × .06 × 12 ---------- = $2 360

The incorrectness resulting from the commercial method (using 360 days as denominator) usually is negligible and is fully justified by the economy of time in computation. It may be noted that under this practice the amount of annual interest is $^{1}/_{12}$ more than under the method used by the government.

4. When paper is discounted by a bank, even though its term be given in months, the bank invariably counts the exact number of days in estimating the amount of the discount. Take a note dated June 25 with a term of 3 months and due therefore on September 25, but discounted at the bank on July 25. The term of discount, instead of being 2 months, would be for 62 days, a gain to the bank of 2 days on a 360-day basis.

=Short Methods of Interest Computation.=—In calculating interest or discount, the so-called 12% or 6% method seems the easiest of application. Its base is taken as $1. In the 12% method the interest for a year is therefore 12 cents, for a month 1 cent, and for a day ■ mill. In the 6% method, the interest for a year is 6 cents, for a month ½ cent, and for a day ■ mill. Using these fractions with the years, months, and days as multipliers, the result is the interest on $1 for the given period. This result multiplied by the face of the note gives the required interest, assuming that the interest rate is 12% or 6%.

A variation of the above gives the following rule, somewhat easier to apply. Reduce the time to days—using a 360-day year, 30-day month basis; multiply the time by the face, point off three places (i.e., treat the product as mills), and divide by 3 or 6 according as the calculation is on a 12% or 6% basis. If the basis used is 6%, but the actual rate is different, add or subtract whatever aliquot part the given rate is more or less than 6%; i.e., if the rate is 8%, add $^{2}/_{12}$ or ■; if 5%, subtract ■; etc. The following example will illustrate:

A note for $1,000 dated June 10, 19—, for 4 months, with interest at 7%, was discounted July 30 at 8%. Find the net proceeds. The note when due will be worth $1,000 plus 4 months' interest at 7%. That becomes the basis for the discount calculation.

Applying the 6% method:

4 months = 120 days Multiplied by 1,000 (face of note) ------- 120,000 Marking off 3 points 120 Take ¹/■ (index for 1 day) ¹/■ --- 20 = interest @ 6% Add ¹/■ 3.33 ---- 23.33 = interest @ 7% Add 1,000 -------- Value of note on October 10 1,023.33 -------- This amount (1,023.33) is the basis on which the discount is to be figured.

Multiply by the term of discount (72 days[2])

1,023.33 72 --------- 2,046.66 71,633.1 --------- 73,679.76 --------- Marking off 3 points 73.68 Take ¹/■ (day index) ¹/■ --------- 12.28 = discount @ 6% Add ²/■ or ■ 4.09 --------- 16.37 = discount @ 8% --------- Value of note on October 10 1,023.33 Less discount 16.37 --------- Net proceeds on July 30 1,006.96 =========

[2] The 72 days are arrived at as follows:

1 day in July 31 days in August 30 " " September 10 " " October -- 72

CHAPTER XXIV

METHODS OF POSTING

=The Journal and Ledger Records Differentiated—Posting.=—When a correct and complete record of business transactions has been made in the various journals, practically all the current information needed by the business has been secured. However, because this information is recorded in chronological order, it is not available for use. It requires sorting, grouping, and indexing. To meet this requirement the original chronological record must be transferred to other records which provide for the desired grouping. The separation of the general journal into journals for different classes of transactions such as sales, purchases, and cash, results in making certain kinds of information somewhat more available, but more than this is required for business management. The original records must be grouped and summarized under proper account titles, so that the total results for the period may be had under review at one time. The book containing these account titles is called the ledger, and the transfer of the original record to the ledger is called posting.

=Time of Posting.=—Where subsidiary journals are used, it is not customary to post all entries at the same time. The entries affecting personal accounts, i.e., those of customers and creditors, should be posted daily. Inquiries from customers as to their balances are received every day, and in order that this information may be given promptly and correctly, customers ledger accounts should be kept up to date in every respect. This is a matter of great importance because, if the information desired by the customer is not given promptly, or if an error is made in giving it, thus calling for correction at a later date, the customer's good-will may be lost and his trade transferred to others. For this reason personal accounts, especially those with customers, should be posted daily, and great care should be exercised in doing the work.

All other accounts may have their postings made periodically—once a week or once a month—the frequency depending upon the need of the business for the information furnished by the accounts. The flow of cash—always of importance—is shown daily by the cash book record; the volume of sales each day can be had from the sales journal; but information as to expenses can usually be had only from the ledger after completing the weekly or monthly postings.

=Methods of Posting.=—Knowing that errors in posting are easily made and that when made they may cause great confusion, it is important for the bookkeeper to know what kinds of errors occur most frequently, and to study means of avoiding them. Certain methods of posting have been found to produce a minimum of error. Some points in connection therewith will be considered here.

One of the chief errors in posting is to make entry on the wrong side of the account, i.e., to post a debit as a credit, or vice versa. The use of subsidiary journals has done away with a large part of errors of this kind, yet it is advisable to keep the following points constantly in mind when posting:

1. The sales journal is a "charge" journal, i.e., the individual items represent debits and must therefore be posted to the debit side of the proper ledger accounts. The sales _summaries_, however, are credits and must be posted as such.

2. The purchase journal is a “credit” record and all postings, except summaries, are made to the credit side of the respective accounts.

3. In the cash receipts journal, each individual item represents a credit, as explained in a previous chapter, and each individual item in the cash disbursements journal represents a debit. Hence, postings of the individual items on the debit side of the cash book must be made to the credit side of the ledger account, and postings of items on the credit side of the cash book must be made to the debit side of the ledger accounts. The posting of the summary entries of the cash book follows the debit and credit designation made at the time of summarization. The principles here involved were fully discussed in Chapter XIX.

4. In the Journal the debits and credits of each entry are fully expressed, i.e., neither element is suppressed. In posting from this record it is best to transfer all the debits consecutively and then all the credits. The possibility of posting a debit item as a credit is thereby greatly reduced.

=Cross-Indexing the Entries.=—An essential part of posting, in addition to recording the date and the amount, is to cross-index every entry, i.e., to index it both in the book of original entry and in the ledger. The “folio” column in each book is used for this purpose. The index in the ledger consists of the first letter of the book of original entry followed by the page number, and the index in the book of original entry shows the number of the ledger page to which the item is posted. (See Form 22.)

In this way, when the indexing in both books is completed it is possible without loss of time to trace the entry from the journal to the ledger, and vice versa. Usually the ledger folio is entered in the book of original entry immediately after each item is posted. When this is done the absence of a reference number in the journal indicates that the item has been omitted in posting. This check is frequently helpful in tracing errors. Some bookkeepers, however, before doing any posting, go through the book of original entry and from the account index of the ledger enter in the ledger folio column of that particular journal the ledger page numbers. By this method, much time is saved in finding the account in the ledger, but a _check mark_ should be placed after each item as soon as it is posted, to indicate the fact. Then the absence of the _check mark_ indicates an unposted item.

[Illustration: Form 22. Cross-Indexing in Posting]

=Explanatory Matter in the Ledger.=—In posting personal accounts it is customary to show the terms of credit in the explanation column of the account. In this way the face of the account shows whether the customer pays promptly or not, and affords a basis for his credit rating.

Notes Payable and Notes Receivable accounts in the ledger should show essential data, such as due date, interest rate, etc. However, when a separate note or bill book is used, these data are given therein and may be omitted from the account in the ledger.

With all other accounts, except sometimes the Profit and Loss account, little or no explanatory matter is carried. However, when a posting is made that is at all unusual, it is well to enter explanatory matter in the ledger. From the business man’s point of view, the ledger is the most important book of account, and if its record can be so made as to require a minimum of reference to original books, it serves its purpose so much the better. Where possible, the Profit and Loss account should carry the names of the accounts closed into it; in fact all transfers, whether made on the face of the ledger or by journal entry, should carry the account title and the ledger folio to which and from which the item is transferred. It is a fundamental principle that every entry must be indexed in such a way as to render reference to it easy at any time.

CHAPTER XXV

THE TRIAL BALANCE AND METHODS OF LOCATING ERRORS

=The Trial Balance.=—In Chapter XIV the trial balance was defined as a list of account _totals_, debit and credit, or account _balances_, debit or credit, for all the _open_ accounts in the ledger. This list is set up in two columns, debit and credit, and if the original entries in the journals and the postings to the ledger have been done correctly, the totals of these two columns should be the same.

Neither method of showing the trial balance has any inherent advantage over the other. Some concerns desire the account totals to be shown in the trial balance, as that indicates to some extent the volume of business. This would be true of all accounts which had been opened during the current period. As to those carried over from a previous period little current information would be given. As

a general thing, however, the status of _customers'_ accounts is better indicated when both total charges and total credits are shown. Where only the balance is shown, it does not provide any basis for determining whether that balance is normal for that particular account. In judging a request for a further extension of credit there is a rather close relationship between the volume of trade with a customer and the amount of his unsettled balance.

Sometimes, even the totals of accounts that _balance_ are shown in the trial balance, thus giving the status of _all_ accounts appearing in the ledger. Again, concerns desirous of knowing the net amount owing on customers' accounts and the net amount owed on creditors' claims, require _balances_ of all personal accounts and cash, but debit and credit _totals_ of all other accounts. No unalterable rule can be given. The manner of showing the accounts in the trial balance is governed by the way in which the trial balance is to be used and the purpose it is to serve. Manifestly, however, the trial balance cannot give information of every kind desired by a manager. As personal accounts are usually handled by canceling offsetting credits against corresponding debits and carrying only balances forward, the trial balance cannot well show at the same time both total transactions and outstanding balances. Only in small concerns could the trial balance give the information which in larger concerns would be gathered statistically and furnished in addition to the trial balance.

The tendency in modern accounting is to make the ledger record so detailed that all accounts are _currently_ "uniphase," i.e., have entries on but one side, and in connection with such accounts the two methods of entering them in the trial balance are identical, because the total of the one side of the account is at the same time the balance of the account. It must be observed that as a matter of course this modern tendency does not apply to personal accounts nor to adjustment and closing accounts.

=Errors in the Trial Balance.=—The manner of entering the small pencil footings of both sides of each account and also the account balances previous to taking the trial balance, was explained in an earlier chapter. This preliminary work should be done carefully so as to reduce errors to a minimum.

It is not purposed here to discuss all the kinds of errors that find their way into the accounting records. Errors are frequently made in the original analysis and classification of the transaction, which, as previously stated, result in an entirely incorrect showing of financial condition. Such errors do not affect the balance of the books and are not detected by the trial balance. Their detection is one phase of the professional auditor's work. This discussion has been qualified by saying that _if_ the work of original and secondary entry has been done correctly, then the ledger should prove. Some points in connection with errors which often occur in posting will be treated here.

The equality of the two totals of the trial balance proves that for every debit entry on the books there has been made an equal credit, or at any rate that the sum of all debit entries equals the sum of all credit entries; i.e., it proves only the _mathematical_ correctness of the work.

It might happen that an item, though posted to the _correct side_ of the ledger, has been entered in the _wrong account_. The trial balance would not detect an error of this kind. For example, John Doe's account might be debited with a charge belonging to Richard Roe, both being customers. This of course would make the books show wrong balances in those particular accounts, but would not cause an incorrect showing in the _total_ assets. However, more serious results may come from an error caused by posting to the wrong account.

According to the schedules shown earlier, all transactions bring about increases and decreases in the three main groups of accounts, viz., assets, liabilities, and proprietorship. A transaction resulting in an increase of assets may have its credit in any of the three classes—decrease of assets, increase of liabilities, or increase of proprietorship. A credit entry in any one of these would result in an exact offset to the debit and would therefore so far as that transaction was concerned, result in equal debits and credits in the trial balance; but were entry made to the wrong group of accounts, it would bring about absolutely false results. This would be the case if a proprietorship account were credited, resulting in an increased profit, when the credit should have been to the liability group with a resulting increase of the liabilities—two divergent results.

Thus, while the trial balance does not detect errors in posting to the wrong account, it has great value in that its equality is considered as good evidence of the correctness of the books. This is so because errors of the kind just referred to are not of so frequent occurrence as those involving only the mathematics of the work.

=Suggestions for Locating Errors.=—Where trial balance totals do not agree, it is certain that one or more errors have been made somewhere. The following suggestions may be useful in locating them:

1. If there is a difference of 1 in any column, i.e., .01, .10, 1.00, 10.00, etc., the error very likely results from wrong addition. Check additions of the trial balance and if the error is not located there, those of the ledger accounts must be checked as well.

2. If the difference between the two trial balance totals is an even number, divide this difference by two and look through the trial balance for an item of that amount but entered as a debit instead of a credit or vice versa. The amount of the error must be divided by two because the placing of a given item in the wrong column would result in a difference of _twice_ this amount in the totals of the trial balance. If the error is not located in the trial balance, it may be necessary to look through the ledger accounts because the wrong placing may have occurred there.

In checking through the ledger for an error of this kind, some aid is afforded by the fact that all postings from _even_ pages in the cash book (i.e., the cash receipts) appear on the _credit_ side of the ledger accounts, and all postings from the _odd_ pages in the cash book appear on the _debit_ side of the ledger accounts. If, therefore, in any of the _credit_ reference columns in the ledger is seen a reference like “C 13” or “C 29,” or in any of the _debit_ reference columns an index like “C 40” or “C 58,” it is probable that the error is due to posting to the wrong side.

3. If the mistake has not been found in this way, the trial balance should be checked against the ledger to be sure that no open accounts have been omitted. Examine all closed accounts to see that they balance.

4. Examine the posting index column of all books of _original_ entry to see that no items have been omitted in posting.

5. When the totals of the trial balance are unequal, the error may lie either in the debit total or in the credit total, or both may be wrong. Even when the trial balance “proves,” both totals may contain the same error. In order to determine what is the correct footing, the following method may sometimes be applied: Take the total of the previous trial balance, add to it the current totals from the several journals, and deduct the total of all accounts closed during the period. The result shows the correct footing for the present trial balance. Where the number of accounts closed during the period is large, the work entailed by this method may be prohibitive. The method is of easy application only when the trial balance is taken by means of debit and credit totals.

It may be left to the student to prove why this is a correct method for determining the present trial balance total. Suffice it to say that it is based on the fundamental fact that for every credit item in any of the journals there is of necessity a debit or group of debits the total of which corresponds with the credit item. Duplicating entries in two or more journals must be eliminated from the journal total.

The following table will serve to illustrate the above method:

Previous trial balance total $12,967.30 Sales journal total for current period 8,429.60 Purchase ” ” ” ” 5,627.40 General ” ” ” ” ” 564.90 Cash receipts ” ” ” ” 2,572.60 Cash disbursements ” ” ” 1,962.75 ---------- $32,124.55 Closed accounts total 1,211.41 ========== Correct trial balance total $30,913.14

6. If the difference between trial balance totals is divisible by 9, the error may be due to a _transposition_ of figures or to a _transplacement_, sometimes called a _slide_. A transposition is an interchange of figures, as 96 for 69, 215 for 512, 6,274 for 4,276, etc. The first is called a simple or one-column transposition, the second a two-column, and the last a three-column transposition. One-column transpositions may also occur in numbers of three or more figures, as 172 for 712, or 3,129 for 1,329.

=Transpositions.=—The following rules will be of help in locating errors of transposition. To determine divisibility by 9, the easiest way is to “cast out” the 9’s.

(a) If the difference between the trial balance totals is divisible by 9 and consists of less than three figures, i.e., 9, 18, 27, 36, a one-column transposition may be the cause of the error. Divide this difference by 9. If the quotient is 1, the difference between the two transposed figures is 1. If the quotient is 2 or 3 or 4, the difference between the transposed figures is 2 or 3 or 4, etc. For instance:

Correct Transposed Number Number Difference

54 45 9 divided by 9 = 1 87 78 9 ” ” 9 = 1

75 57 18 ” ” 9 = 2 97 79 18 ” ” 9 = 2

30 03 27 ” ” 9 = 3 85 58 27 ” ” 9 = 3

Thus the figures in the last column indicate the difference between the figures of the original item.

(b) If the difference is divisible by 9 and consists of two significant figures followed by one or more naughts, the error may be caused by a _one-column_ transposition between columns of a higher order. For instance:

The correct amount being 6,394 and the transposed amount 3,694 ----- the difference is 2,700

which divided by 9 gives 300. This indicates a transposition between figures in the “100” and “1,000” columns, the difference between these figures being 3. Reference to the example given will show this to be the case.

(c) When the difference between the trial balance totals is divisible by 9 and lies between 99 and 1,000, the error may be due to a _two-column_ transposition. Here the middle figure of the error is always a 9, e.g., an error of 297 resulting from writing 512 as 215. Dividing the number (27) formed by the two outside figures of the difference by 9, the quotient (3) is the difference between the two transposed figures, i.e., the 5 and the 2. For instance:

Correct Transposed Number Number Difference

514 415 99 9 divided by 9 = 1 735 537 198 18 ” ” 9 = 2 981 189 792 72 ” ” 9 = 8

Thus, the figures in the last column (1, 2, 8) indicate the difference between the two transposed figures in the correct item. Instead of dropping the middle figure of the difference and dividing by 9 as above, the entire difference figure may be divided by 99 with the same result.

(d) Similarly, when the difference is 999 or a four-figure amount with two 9’s in the middle, a three-column transposition may be indicated thereby. For instance:

Correct Transposed Number Number Difference

5,174 4,175 0,999 09 divided by 9 = 1 6,392 2,396 3,996 36 ” ” 9 = 4 7,081 1,087 5,994 54 ” ” 9 = 6

the figures in the last column (1, 4, 6) again indicating the difference between the transposed figures in the original.

Instead of dividing the number formed by the outside digits (9, 36, 54) by 9, we might divide the full amount of the difference (999, 3,996, 5,994) by 999; this would give the same result.

The reason for the divisibility of this difference by 999 in an error of this kind is apparent when a number is given algebraic notation instead of Arabic. The Arabic number 2,197 expressed algebraically would be 2,000 + 100 + 90 + 7. Generalizing, we may formulate any number of four figures by 1,000a + 100b + 10c + d, in which a, b, c, and d may have values from 0 to 9 inclusive. A transposition between the thousands and units digits, the “a” and the “d,” would result in the following number: 1,000d + 100b + 10c + a. The error would therefore be:

Original number 1,000a + 100b + 10c + d Transposed number a + 100b + 10c + 1,000d ---------- Difference 999a - 999d

This error is plainly divisible by 999, and the resulting quotient (a-d) is the difference between the two transposed digits.

It may be shown similarly why 99 is a divisor of the error cited under case (c) above.

=Transplacements.=—A transplacement or slide occurs when some or all of the digits of a number are moved one or more places to the right or left without change in the order of the figures; for instance, 736 written as 73.60, as 7.36, or as 700.36. The first is called a one-column slide, the second and third two-column slides. The error caused by a one-column slide is always divisible by 9, a two-column by 99, a three-column by 999, etc. The division by 9, 99, 999, etc., disregarding decimals, always gives the figures whose transplacement has caused the error. Thus the error caused by writing 736 as 73.60 is 662.40, which divided by 9 is 736; or 736 written as 7.36 produces an error of 728.64, which divided by 99 gives 736; or 736 written as 700.36 causes an error of 35.64, which divided by 99 gives 36, the part transplaced. The reason is similar to that given above for the transposition.

When a whole number of dollars is written as cents, the resulting error is divisible by 9 and moreover the cents _added to_ the dollars gives 99 in each case. For instance in writing:

.73 instead of 73.00, the resulting error is 72.27 .58 ” ” 58.00, ” ” ” ” 57.42 .16 ” ” 16.00, ” ” ” ” 15.84

When the error in the trial balance is of this kind, the amount transplaced may be found by subtracting the cents of the error from 100. In the above examples this difference would be 100-27, 100 -42, 100-84, or 73, 58, and 16 respectively, which are in each case the figures of the transplaced amount as seen in the example. Having determined this, the trial balance and ledger accounts should be gone over to look for a slide of the given number.

=Checking the Postings.=—From the above discussion, the impossibility of determining in all cases the nature of the error is quite evident—particularly as to whether it is one caused by a transposition or a slide. Unless the kind of error is readily discernible, it is usually advisable to employ the method of checking, i.e., going over all the work of posting to determine its correctness—or other methods to be discussed in Chapter LI. After all, careful work in making the record with legible figures and in proving additions and subtractions, wherever possible, more than pays for itself in the time saved hunting for errors caused by slovenly and inaccurate work.

CHAPTER XXVI

THE CLASSIFICATION OF ACCOUNTS

=Accounting Routine Related to Account Classification.=—The basic relationships between the accounts and the statements of financial condition were explained in Chapter IX, where a chart of accounts was given to illustrate the fundamental equation of the ledger. The complete record-making routine, comprising the use of business papers for memorandum entry, the use of the journals for the first formal record of transactions, and the use of the ledger for the classified entry, has now been explained. There remain, however, two classes of entries, the adjusting and closing, whose relationship to the journal-ledger routine has not yet been fully discussed although their relationship to each record has been separately considered. Since the closing of the books contemplates the drawing up of financial statements and since all record-keeping must have in view from the very beginning a proper classification of accounts giving the desired information to be reflected finally in the statements, it seems best at this point to consider some phases of account classification before proceeding with a detailed explanation of the method used in adjusting and closing the books.

=The Need for Classification.=—As explained in preceding chapters, accounts may be broadly classified into the three main divisions of assets, liabilities, and proprietorship. This threefold division, however, is inadequate for the purpose of presenting detailed information as to the kinds of assets owned by the proprietor, the nature of his liabilities, and the causes that have produced increases or decreases of proprietorship. Subdivisions of the three main groups must, therefore, be made, the minuteness of subdivision being determined by the amount of detailed information desired.

One of the main purposes of account-keeping is to summarize results on the financial statements. The items which appear on these statements represent the balances of one or more groups of accounts. Items, for instance, such as “Land” and “Buildings,” may each represent a single ledger account recording the value of the land, the factory, and the office buildings respectively; whereas the item “Accounts Receivable” represents the group of customers’ accounts, the number of which may run into the hundreds and even thousands and which may be kept in a ledger devoted exclusively to the recording of their detail. The reasons for grouping assets and liabilities on the basis of degree of liquidity, and the advantages resulting from such grouping when drawing up the summary statements of the period, were discussed and illustrated in Chapter III.

It is evident from the above that the classification or grouping of the ledger accounts is reflected in the items on the financial statements; and that, conversely, the kind of information which it is desirable to present on the statements will to a large extent govern the groupings in the ledger. This dependence of the account titles and groupings in the ledger upon the end and aim in view makes it necessary to draw up the original classification with great care. To aid in securing a record correct in the first instance, certain fundamental groupings or classification of accounts must always be made.

=Basic Classification.=—While other groupings of accounts have been made, the classification used here has been from the beginning a three-phase one, consisting of an asset, liability, and proprietorship nomenclature. The third group of accounts, proprietorship, is further divided into the two subclasses, temporary and vested, as explained in Chapter XII. At the end of the fiscal period, after the ledger has been closed, there appear only asset, liability, and vested proprietorship accounts; but during the fiscal period, the temporary proprietorship accounts come into being and certain asset and liability accounts take on a mixed character resulting from the method in which the record is kept. This method is dictated not by a pure accounting theory, but by a theory designed to accommodate itself to the practical requirements of the average business. It is because the practical method of making

the record falls short of the theoretically exact method, that adjustments must be made before summarizing.

For this reason, a record is not made daily of the portion of assets which has been consumed each day, but the asset accounts are adjusted at the close of each fiscal period to separate their asset and proprietorship elements. Also, when a note is discounted at the bank, its entire face value is set up as a liability. From the standpoint of accurate accounting, however, the face value of the note overstates the liability for the current fiscal period, if the note falls due in the following period, by the amount of the prepaid interest charge belonging to that next period. Only on the due date of the note does the record show the true condition of the liability. Thus, a “practical” method of keeping the record necessitates the use of certain “mixed” accounts. Fundamentally, however, the three-group classification given answers every necessary purpose.

=Fundamentals of a Good Classification.=—In judging the fitness of a particular classification, the end and purpose for which it is made must always be the criterion. Any classification of accounts must, therefore, have in view the fact that all accounts lead up to the balance sheet and profit and loss statement, and that they must provide the data necessary for the summaries of these statements. Classifications may be made from many different viewpoints and for many different purposes, but a classification which is logical and carries titles clearly indicating the purpose for which the accounts are intended, and which therefore needs little or no explanation, is a satisfactory classification. The three-group classification—assets, liabilities, and proprietorship—meets these requirements.

A two-group classification—real and nominal—is frequently used. Under this classification, asset and liability accounts are grouped as real, and proprietorship accounts comprise the nominal class. This is the standard classification. The student should be familiar with it, although the meaning of the groups is not so apparent as in the case of the three-group classification, referred to above.

=Classifying Business Transactions.=—When making the record of business transactions on the books of account, it is necessary, first, to determine the main account group or groups affected by the transaction. After this is done, it is usually easy to determine which particular account in the group is affected. Great care must be used in the determination of the main groups, since a wrong classification results in an incorrect showing in the summary statements at the close of the fiscal period.

To illustrate, in Chapter XIII reference was made to the fundamental distinction between capital and revenue expenditures. When making the original entry of some transactions this difference is frequently lost sight of and what should be charged to an asset account is charged to some expense account or vice versa. This charging to an asset account, of items which are rightly expense items and therefore cut down the proprietorship element of the business, is one of the easiest ways of inflating the profits for a period and so of making a better showing than would be the case if the facts were recorded correctly.

Correct classification of transactions is a matter of vital importance. An accurate analysis of every transaction must therefore be made before bringing it on the books. After determining the _main_ group of accounts in which record is to be made, further analysis as indicated above is necessary in order to fit a particular transaction into its place under a suitable _account_ title belonging to the main group.

=Detailed Classification.=—In dealing with account classification, the more detailed groupings must also be considered. Such consideration deals, (1) with account titles in detail and even with the kinds and classes of transactions to be recorded under particular titles, and (2) with the arrangement and use of these detailed accounts in the various sections of the summary statements at the close of the fiscal period. Certain broad principles have already been laid down which are to be followed in the selection of the account title, and the objection to the inclusion of unlike items under the same title, and the care to be exercised against a more detailed analysis than is required by the needs of the business, have also been explained. That system of accounts which groups only one kind of data under each particular account title is better than a system which mixes its records by grouping dissimilar data under a single head. Yet, caution is always to be exercised against too great detail and an unnecessary multiplication of accounts. Oftentimes essential facts and forces of business activity are lost sight of in a maze of detail.

Below is given a somewhat detailed classification of accounts in accordance with the two considerations stated above. No attempt is made at completeness; only the more usual titles are presented. This classification will be used throughout the rest of the volume.

CHART OF ACCOUNTS _Asset Accounts_

CURRENT Cash Petty Cash Notes Receivable Accounts Receivable _Reserve for Doubtful Accounts_[3] Merchandise Inventory Stocks and Bonds (for current investment) Accrued Income DEFERRED CHARGES TO OPERATION Shipping Supplies Insurance

Interest Office Supplies Etc.

FIXED Furniture and Fixtures _Depreciation Reserve Furniture and Fixtures_ Delivery Equipment _Depreciation Reserve Delivery Equipment_ Buildings Depreciation Reserve Buildings Good-Will Etc.

Liability Accounts

CURRENT Notes Payable Accounts Payable Dividends Payable Accrued Expenses

DEFERRED INCOME Rentals Interest Subscriptions Etc.

FIXED Mortgages Payable Long-Time Notes Payable Bonds Payable Debentures Etc.

Proprietorship Accounts

VESTED Proprietors, Capital Proprietors, Personal Capital Stock Surplus (Profit and Loss) Reserves of Profit (not valuation items)

TEMPORARY Income, Operating Sales _Sales Returns and Allowances_

Cost of Sales: Initial Inventory Purchases Inward Freight and Cartage _Purchases Returns and Allowances_ _Final Inventory_

Expenses, Operating Selling Expenses Salesmen's Salaries and Commissions Salesmen's Traveling and Entertainment Expenses Delivery Expense (wrapping, shipping room, horse and motor expenses, delivery salaries, etc.) Outward Freight Sales Management Salaries and Expense Advertising Depreciation on Salesroom Equipment, Delivery Equipment, etc. Sundry Selling Expenses

General Administrative Officers' Salaries General Salaries Stationery and Printing Legal Expense Postage Telephone and Telegraph Sundry Office Expense and Supplies Depreciation on Office Building, Equipment, etc. Light, Heat, and Power[4] Taxes Insurance[5] Financial Management Expense and Income Interest Expense Rent[6] Bad Debts Sales Discount Collection Expenses _Interest Income_ _Purchase Discount_ Non-Operating Expense Non-Operating Income

[3] The items in italics in this chart are to be handled as subtraction items from the account below which they are placed or from the group in which they appear.

[4] Light, heat, and power expense should in strict theory be distributed over the departments using it; the selling department to be charged with its share and the general administrative with its share. Where such procedure is difficult or undesirable, the expense is best classified as above.

[5] These items are sometimes distributed partly to Selling and partly to General Administrative where an equitable basis for distribution can be determined.

[6] These items are sometimes distributed partly to Selling and partly to General Administrative where an equitable basis for distribution can be determined.

=Method of Arranging Accounts in the Ledger.=—As to the order of arrangement of accounts in the ledger, one principle governs: Arrange all accounts in such a manner as to facilitate the drawing up of the final statements. Thus, assets should come first, arranged in the degree of their liquidity or availability, and each valuation account following its particular asset. Liabilities, coming as they do after the asset accounts, should be arranged in a similar order. Next should come the proprietor's accounts, the summary Profit and Loss account, and the income and expense accounts in the order in which they are to be used in the statement of profit and loss. Where only one ledger is kept, the personal accounts receivable and payable are usually recorded in distinct groups, after all the other accounts, towards the back part of the ledger rather than in the position required by the principle just stated.

A trial balance taken from a ledger in which the order of arrangement of the accounts is strictly in accordance with this principle, is called a "classified trial balance."

CHAPTER XXVII

THE WORK SHEET AND SUMMARY STATEMENTS

=Procedure Preliminary to Adjusting and Closing.=—Before tracing the detail of the adjusting and closing entries through the books, explanation will be given of the usual method of insuring the accuracy of this periodic work preliminary to the formal closing of the books. This preliminary work comprises the technical procedure employed in drawing up the balance sheet and profit and loss statement before the books are closed. It thus brings about a summarization of the period's results made _outside_ the books instead of _in_ them. Therefore, a proof of the accuracy and correctness of the work of adjusting and closing can be secured before the summarization entries are made in the books. After proof of accuracy has thus been secured, the statements are used as a guide in making the formal adjusting and closing entries.

The information for the balance sheet and profit and loss statements comes mostly from the regular monthly trial balance taken at the end of the period just _before_ the adjusting entries are made. This trial balance must of course be modified in order to include the effect of the adjustments. For the purpose of incorporating the adjustments in the trial balance and then separating the accounts into the two groups, namely, those which are to be summarized in the profit and loss statement and those which are to be used for the balance sheet, a regular form is used known as the accountant's "work sheet." This form and the method of its use will now be explained.

=The Work Sheet.=—For the work sheet "analysis" paper is used, which is ruled in its simple form as shown in the illustration on pages 226 and 227, space being provided for:

1. Account titles 2. Trial balance items 3. Adjustment items 4. Profit and loss items 5. Balance sheet items

For the purpose of illustration, a trial balance and a list of adjustments are given below, followed by the work sheet and the necessary explanatory detail.

The student must understand that the work sheet is no part of the formal accounting record, nor is the procedure employed by it a part of the formal work of closing the books. It is only a means by which a rough summarization of the period's results may be made _outside_ the regular accounting records and all the data needed for the formal statements be brought together. Its purpose is to secure and prove the accuracy of results before the formal adjusting and closing work is entered on the books. Where many or complicated adjustments are to be made, with a resulting probability of error and difficulty in an orderly arrangement of the adjusting entries, the method of the work sheet is almost indispensable. The formal adjusting entries are then made up from the adjustment columns of the work sheet.

ADJUSTMENT DATA, December 31, 19—

Inventory of Merchandise $26,500.00

Estimated Depreciation: Office Furniture and Fixtures, 10% of original cost Store Furniture and Fixtures, 10% of original cost Delivery Equipment, 16■% of original cost Buildings, 4% of original cost Doubtful Accounts, ¼% of Net Sales

Accrued Income: Interest Accrued on Notes Receivable 150.00

Deferred Expenses: Insurance Unexpired 250.00 Advertising Paid in Advance 300.00 Printing and Stationery Supplies on hand 150.00 Selling Supplies and Expense 200.00

Accrued Expenses: Taxes 340.00 Salesmen's Salaries 175.00 Interest on Notes Payable 50.00

Special Police on Strike Duty 150.00 Office Salaries 100.00

Deferred Income: Sub-Rentals Paid in Advance 50.00

The initial step in the use of the work sheet is to enter the trial balance in the first two columns, as shown on pages 226, 227. The accounts in the trial balance should be arranged in classified form before being entered on the work sheet, as this aids greatly in drawing up the statements. The various adjustment entries, debit and credit, which are almost the same as in the ledger, are then entered in the adjustment columns. The work sheet may be looked upon somewhat as a ledger, entries in whose accounts are to be made horizontally instead of vertically. The analogy to the ledger cannot be carried too far, however. It should be noted that when it is necessary to adjust any account in the trial balance by increasing its debit, this is accomplished by entering the item in the debit adjustment column on the same line with the account to be adjusted. On the other hand, if a subtraction is to be made from a debit amount shown in the trial balance, the amount to be deducted is entered in the credit adjustment column. A complete debit and credit entry must be made in the adjustment columns for each adjustment.

There is given below a debit and credit _list_ of these entries as they are to appear on the work sheet. The manner of making and cross-indexing these adjustment entries is indicated by the cross-reference letters used. It will be noted that, while in most instances these entries are exactly the same as the formal adjusting journal entries, there is a difference in the case of the merchandise inventories.

The student should understand that the _list_ of adjustment entries given below does not appear anywhere in the formal accounting records. It is shown here in _journal form_ only to indicate the debits and credits of the entries to the work sheet. Entries of the adjustment transactions are always made direct to the work sheet, never being set up in journal form. Each of these entries should be traced into the adjustment columns of the work sheet. The figures in parentheses just preceding the debit and credit amounts are, of course, not _ledger folios_ but refer to the similarly numbered items on the work sheet so that the student will have no difficulty in tracing them.

(a) Merchandise Inventory—Final (8) 26,500.00 (a) Merchandise Inventory—Final (8) 26,500.00 (b) Depreciation Office Furniture and Fixtures (51) 280.00 (b) Depreciation Reserve Office Furniture and Fixtures (10) 280.00 (c) Depreciation Store Furniture and Fixtures (51) 1,200.00 (c) Depreciation Reserve Store Furniture and Fixtures (12) 1,200.00 (d) Depreciation Delivery Equipment (51) 750.00 (d) Depreciation Reserve Delivery Equipment (14) 750.00 (e) Depreciation Buildings (51) 1,400.00 (e) Depreciation Reserve Buildings (16) 1,400.00 (f) Bad Debts (50) 482.88 (f) Reserve for Doubtful Accounts (5) 482.88 (g) Interest Income (Accrued) (52) 150.00 (g) Interest Income (43) 150.00 (h) Insurance (Deferred) (53) 250.00 (h) Insurance (39) 250.00 (i) Advertising (Deferred) (53) 300.00 (i) Advertising (31) 300.00 (j) Printing and Stationery (Deferred) (53) 150.00 (j) Printing and Stationery (37) 150.00 (k) Selling Supplies and Expense (Deferred) (53) 200.00 (k) Selling Supplies and Expense (30) 200.00 (l) Taxes (38) 340.00 (l) Taxes (Accrued) (54) 340.00 (m) Salesmen's Salaries (29) 175.00 (m) Salesmen's Salaries (Accrued) (54) 175.00 (n) Interest Cost (40) 50.00 (n) Interest Cost (Accrued) (54) 50.00 (o) Special Police on Strike Duty (46) 150.00 (o) Special Police on Strike Duty (Accrued) (54) 150.00 (p) Office Salaries (34) 100.00 (p) Office Salaries (Accrued) (54) 100.00 (q) Sub-Rentals Income (45) 50.00 (q) Sub-Rentals Income (Deferred) (55) 50.00

[Illustration: Form 23. Work Sheet]

In order to set up some of these adjusting entries, it becomes necessary to add some new accounts on the work sheet. The student will note these appended at the end of the regular trial balance shown on the work sheet. They are, first, Bad Debts and Depreciation, under the latter of which the detail of the fixed assets subject to depreciation is given, and then follow in order the balance sheet classifications of Accrued Income, Deferred Charges to Operation, Accrued Expenses, and Deferred Income, provision being made to show under each of these titles the detail of the accounts involved.

It will be noted that some of the adjusting entries are not set up in the adjustment columns in exact accord with the way in which the same items are entered on the ledger, but rather in accord with the use to be made of the particular items in drawing up the periodic

statements. The purpose of the columns is not to make the adjustments and summarization in a formal manner as is done in the books, but to gather together all the adjusting data so that a correct separation of the balance sheet and profit and loss items can be made for use in the formal summary entries and in the statements. Thus, instead of transferring the initial inventory to the Purchases account, it is allowed to remain under its own title, because it will be needed as a separate item in drawing up the cost-of-goods-sold section of the profit and loss statement. Similarly, the final inventory is not shown deducted from Purchases, but is set up, debit and credit, in the adjustment columns, opposite the title “Merchandise Inventory—Final,” which is inserted immediately following the account “Merchandise Inventory—Initial.” At the time of summarizing, the debit item goes into the balance sheet, while the credit item goes into profit and loss. This method of handling provides in the profit and loss columns the detailed information needed for the cost-of-goods-sold section of the statement, comprising Initial Inventory, Purchases, In-Freight, Purchases Returns and Allowances, and Final Inventory.

The bad debts adjustment is entered in the adjustment columns as a debit to Bad Debts and a credit to Reserve for Doubtful Accounts. Similarly, the depreciation entry is shown as a debit to Depreciation in detail, the credits going to the various depreciation reserve accounts.

The adjustments covering deferred charges are shown as debits to the “Deferred Charges to Operation” classification in detail, the offsetting credits being to the various expense accounts as shown in the trial balance. These credits in the adjustment column will, when combined with the corresponding debit in the trial balance column, indicate the net amount of the charge to profit and loss. The other classes of adjustment entries follow the same procedure.

After all adjustments have been made, a complete distribution of the items in the trial balance and adjustment columns is made either to the profit and loss or the balance sheet columns. The difference between the profit and loss columns will thus show the net profit or loss for the period and must be transferred to the balance sheet as a vested proprietorship item. Instead of being shown as a definite addition to the proprietor’s capital, the transfer is indicated as the final item on the work sheet, being a debit in the profit and loss columns to balance them, and a credit in the balance sheet columns. This difference, $14,747.12 in our illustration, constitutes the net profit for the period, and when added to the credit side of the balance sheet columns should give a total equal to the total of the debit balance sheet column. This transfer of net profit effects a proof of the accuracy of the work.

When this proof has been secured, the formal profit and loss statement should be drawn up, all of the material for which will be found in the profit and loss columns of the work sheet, where it is arranged in almost the exact order needed for the formal statement. The information for the balance sheet is found similarly in the balance sheet columns, all of the detail being properly grouped but a rearrangement of the order of some items being necessary. Thus, while the detail of the deferred charges to operation has been gathered together in one place in the work sheet, in the formal balance sheet this group of items must appear immediately after the current asset section. See page 234 for the profit and loss statement and page 232 for the balance sheet.

It is thus seen that the work sheet provides a convenient method of passing through the trial balance the adjustments necessary to a summarization of the results of the period and of effecting a rough summarization of these results. The work sheet becomes the source of information for the formal statements and a preliminary stage to the adjustment and closing of the books.

The purpose of the formal adjusting entries and the manner of framing them are fully explained in Chapter XXVIII. After the information on which they are based is brought together and entered on the work sheet and after the work of summarization has been proven, the adjustment columns of the work sheet are made the source for these entries. The formal adjusting entries as they appear in the journal are given on page 245. They should be compared with the debit and credit list for the work sheet as given above and the differences noted.

=Need for the Summary Statements.=—Before setting up the formal journal entries necessary to adjust and close the books, the balance sheet and statement of profit and loss will be shown. These two periodic statements do not form an integral part of the books of account. They are drawn up periodically and submitted to the proprietor, because the latter does not always have ready access to the books of account and often lacks sufficient knowledge of accounting to interpret correctly the information shown by the journal and ledger. The periodic statements are intended to show the results of the year in a concise, non-technical form, so that a proprietor, even though not versed in the science of accounts, can readily understand them.

=The Two Forms of Balance Sheet.=—The balance sheet may be arranged in either of two forms. The first form (illustrated on page 232) follows the principles already laid down in Chapter III. This is called the “report form” and is based on the proprietorship equation when written

Assets - Liabilities = Proprietorship

Being non-technical, it is perhaps more favored by executives not versed in technical account-keeping.

The second form (illustrated on page 233) follows the proprietorship equation when written

Assets = Liabilities + Proprietorship

This form shows financial condition by means of the account form, the subtraction of the liabilities from the assets being indicated by their respective debit and credit positions in the account. It will be noticed, however, that this method of showing the subtractions is not strictly adhered to, some deductions being actually performed, as for instance in the case of the valuation reserves which are subtracted from the respective assets to which they apply. This is done in order to render the statement more intelligible. The same principles govern the arrangement of the items and groups of items as in the first form, viz., degree of liquidity for the assets and a similar arrangement for the liabilities. The account form is used almost always when the statement is submitted for publication.

=Two Forms for the Profit and Loss Statement.=—The statement of profit and loss is also made up in either of two forms, called the report form and the account form, based on the same principles as the two forms of balance sheet just discussed. Explanation of the report form has already been given in Chapters V and VI. The account form (illustrated on page 235) is very nearly a transcript of the ledger Profit and Loss account. It differs chiefly in that the information concerning “sales” which is summarized in the Sales account on the ledger is here set up in an inner column and shown summarized on the face of the statement. The information as to cost of goods sold is similarly summarized.

=Interim Statements.=—In many businesses, where the fiscal period is six months or a year, it is often desirable and important that at least approximate results be secured at interim periods. This can be accomplished by means of the work sheet without entailing the burdensome work involved in a formal closing of the books. At the time of the taking of any trial balance, the work sheet can be used as a means of making the necessary adjustments before securing results as to financial and operating condition. Accurate results would of course require as careful work as at the end of the regular fiscal period. The purpose of interim summaries is to indicate trends rather than to show accurate and definite results. At such times, therefore, the inventory is usually estimated, oftentimes the same amount being used as at the beginning of the period. Accruals and deferred items are not so carefully estimated nor in so great detail. Bad debts and depreciation must be taken into account. In this way approximate results for any period—frequently every month—may be secured without interfering with those for the regular fiscal period.

CHAPTER XXVIII

ADJUSTING AND CLOSING THE BOOKS

=Adjustment Entries—Kinds and Place of Record.=—In Chapter XV it was shown that the records as they are usually kept do not reflect the true condition of the business at any time _during_ the fiscal period. For this reason before summarizing the book record for the current period it is necessary to bring onto the books a number of entries the purpose of which is to “adjust” the mixed accounts and thus make the ledger reflect the true condition. These adjustments may be effected by entry made directly on the face of the ledger, but it is better to run them through the journal, thus making it possible to give ample explanation. A further advantage of first recording the adjustment entries in the journal is that in this way all such entries appear in one place in the books of account. The ledger should always be kept as a book of _secondary_ entry, with supporting data in some book of _original_ entry.

Seven types of adjustment entries are needed for the ledger of a mercantile concern. They are:

1. Merchandise Inventory 2. Depreciation 3. Bad Debts 4. Accrued Income 5. Deferred Expenses 6. Accrued Expenses 7. Deferred Income

All such items must be given consideration and entered upon the books before the final results for the period can be correctly shown. It is oftentimes necessary to make correcting entries for items the improper entry or the omission of which are not detected until the close of the fiscal period. These errors, whenever discovered, should of course be corrected at once. Because entries of this kind are in the nature of adjusting entries, consideration of them is included in this chapter.

It may be observed here that if a business manager has an intelligent insight into the development of his enterprise, and carefully watches the volume of sales, purchases, and expenses, he may be able to forecast with some degree of accuracy the approximate results for a given period; but only by making the actual count of stock now on hand and by carefully estimating the classes of items just mentioned, can accurate and dependable results be assured.

All these types of adjustment entries are not always found in every such business, however. Each type will be discussed in turn.

=Inventory of Stock-in-Trade.=—One of the most important adjustment entries is that by which the inventory of stock-in-trade is set up separately on the books. By reference to Chapter XIII it will be seen that none of the accounts connected with merchandise, viz., purchases, sales, returns, etc., contain any definite and up-to-date information as to the value of merchandise on hand. To determine the gross profit on sales this value must be known, and until the gross profit is determined the net profit cannot be ascertained. The balance sheet, the statement of profit and loss, and the Profit and Loss account, call for this information. Therefore, before these statements are made, and before the books can be closed, the value of goods on hand must be determined. The process by which this is done is called “inventory-taking.”

Without discussing the detail of a system of inventory-taking, three fundamental principles can be stated relative thereto:

1. Make sure that all goods belonging to the firm on the date of the inventory are included.

2. Make equally sure that there is no duplication of count, i.e., that no goods are counted twice.

3. See that the condition of the goods, viewed from the standpoint of salability, is indicated.

Two factors of importance enter into the determination of the inventory, viz., the quantity of the goods on hand and their value per unit. Inaccuracy in either factor may lead to a gross error in the final amount. By falsifying the count of the goods the inventory can, of course, be inflated. A usual and more elusive method, often resorted to, consists in raising the price per unit, since the addition of even a fraction of a cent per unit may have the effect of converting an actual loss into an apparent profit. Without further indication of the reason for such valuation, it is now generally required that the inventory be valued on the basis of cost, or market if market is lower than cost. The term “cost” should include all costs, incurred up to the point of placing the goods in condition ready for sale, not only the purchase price, but also duties, freight, drayage, insurance during transit, etc.

After the amount of the inventory has been determined, it is placed on the books. However, before this is done it is necessary that the Merchandise Inventory account be cleared of the goods on hand at the _beginning_ of the period by transferring the amount to Purchases. The following journal entry effects the transfer:

Purchases Merchandise Inventory To transfer the opening inventory to Purchases.

The posting of this entry automatically clears the Inventory account and, by its addition to Purchases, causes that account to show the “total goods to be accounted for.” Purchases, as it now stands, contains both the cost of goods which have been sold during the current period and those which are still on hand as shown by the inventory just taken. Accordingly, to separate the two items, the following journal entry is necessary:

Merchandise Inventory Purchases To set up the inventory of goods now on hand.

This entry when posted shows in the Merchandise Inventory account the asset element, and leaves in the Purchases account the cost of the merchandise sold. The effect of these two entries, then, is to adjust the books to true conditions so far as the merchandise is concerned.

=Depreciation, and Loss on Doubtful Accounts.=—As indicated in Chapter XV, the amount of depreciation of particular assets and the losses due to bad and doubtful accounts are carefully estimated at the close of the fiscal period. The individual depreciation

items are all summarized in a _single_ depreciation account—an _expense_ account—whose total debit is closed out to Profit and Loss. The _depreciation reserves_, however, which are credit items, are handled under separate account titles, and constitute the valuation account of the corresponding assets. The journal entry covering depreciation reads as follows:

Depreciation Depreciation Reserve Buildings Depreciation Reserve Furniture and Fixtures Depreciation Reserve Delivery Equipment Depreciation Reserve Machinery

The Reserve for Doubtful Accounts is the valuation account of Accounts and Notes Receivable. Assume, for instance, that the debit balances of the latter two accounts are $15,900, and the credit balance of their valuation account is $600. The difference between these two accounts, viz., $15,300, represents the present estimated value of Accounts and Notes Receivable. The journal entry made _periodically_ to record the estimated loss from uncollectible items is:

Bad Debts Reserve for Doubtful Accounts

When the two entries above, for estimated depreciation and bad debts, are posted, the present appraised values of those particular assets are brought on the ledger; i.e., from the values, as shown by the respective asset accounts, are taken the portions estimated to have been used up, lost through depreciation, or uncollectible. These lost portions are set up as expense items, leaving in the adjusted asset accounts true asset values as existing at the close of the period.

=Accrued Income.=—As to the asset portion of items of this kind, it is indicated in the account in a manner similar to deferred expenses, as explained on page 242. Take the case of interest income earned but not due. The entry for adjusting it is:

Interest Income (Accrued) Interest Income

The credit part is posted immediately, thereby showing an addition to the income already recorded as earned during the current period. The debit part is posted after the current account is adjusted and allowance made for the closing transfer entry to Profit and Loss. The debit part of the adjusting entry is then entered on the debit side of the _new_ portion of the account. Assume this debit item to be $50, and the interest received during the next period to be $170. The new account will indicate a _credit balance_ of $120, which is the amount actually earned during that period, since the previous period took credit for the $50 accrued or earned during _that_ period.

=Deferred Expenses.=—When a part of the expense paid during the current period applies to the next period, the prepaid portion must be taken out of the current expenses and held over—deferred—as a charge to the expenses of the next period. Taking insurance as an example, the following journal entry effects the required adjustment:

Insurance (Deferred) Insurance

In posting this entry, the credit part is posted first in order to take out of the excessive cost shown chargeable to this period the portion equitably belonging to the next period. When this is done, the _debit balance_ of the Insurance account indicates the amount to be charged to the current period and is the correct charge against the Profit and Loss for the period. After making allowance for the space needed for closing the account, the debit side of the above entry is posted, this debit becoming the first charge in the account for the next period. Note that the use of the bracketed “Deferred” is as a guide in posting. It indicates that that portion of the entry is not to be posted until provision has been made for closing the account. After posting is completed, the Insurance account appears as follows:

INSURANCE ========== Jan. 2 125.00 | Dec. 31 200.00 Apr. 10 250.00 | Aug. 15 300.00 | ------ | 675.00 | ====== | Jan. 1 200.00 |

There remains, of course, the transfer to Profit and Loss of the current balance before the account is _closed_. This closing work is treated later in the chapter.

=Accrued Expense Items.=—These items cover expenses which the business has incurred but has not yet paid, and which are properly chargeable to this period but have not yet been charged on the books. For instance, salaries earned up to the close of the period but not paid at its close constitute an additional charge to the period’s operations which must be entered on the books before they will show true conditions. This amount also constitutes a liability of the business. Accordingly, the journal entry is:

Salaries Salaries (Accrued)

thus charging the Salaries account with the amount due but not paid, and bringing this amount down as a credit balance to the new account for the next period. Assuming this unpaid amount to be $72, the account after closing will show this $72 as a liability on the _closing date_. Its effect, however, during the next period will be to _reduce_ the amount charged to salaries during that period, because this $72, although paid during that period, has already been charged to the previous period.

The credit to Salaries, therefore, serves two purposes, viz., that of showing the outstanding liability at the _close_ of the current period, and that of effecting a reduction of what would be, without this credit, an overcharge to _next_ period's salaries. For example, if the total salary paid during the next period is $600, the _balance_ of $528 is the amount applicable to that period, although the amount actually paid is $600.

=Deferred Income.=—Income received by the business during the present period which, however, belongs to the subsequent period is called "deferred income," as for instance, rent received in advance from a tenant. As to the liability portion of items of this kind, it is indicated in a manner similar to the accrued expense items. In this case the journal entry is:

Rent Income Rent Income (Deferred)

the effect being to decrease the amount of rent income for the current period and to show the portion belonging to the next period deferred to that period's account.

=Corrections.=—When an error has been made in any entry on the books, it should not be erased or scratched out, because by so doing suspicion may be raised as to what was expunged. The wrong item should be ruled out and the correct item written above it or wherever it belongs. This applies particularly to books of original entry whose use as evidence has often been destroyed because many erasures appeared in them.

Another way of making a correction, when an amount has been posted to a wrong account, is first to cancel the wrong posting through a similar entry on the _other side_ of the same account, and then to post it to the correct account. Cross-reference to the two accounts must be made.

When an amount has been posted to the _wrong side_ of _the correct account_, e.g., $100 to the credit side of John Doe's account, when it should have been posted to the debit side, the incorrect credit may be canceled by a debit of $100, and after this the original $100 should be entered on the debit side; or the cancellation and correction may be combined by entering $200 on the debit side. Better still, the incorrect posting may be ruled out and a correct posting made of the _original entry_ whose wrong posting caused the error. Adequate cross-reference should be given so as to make the tracing of the items easy and to indicate exactly what was done.

As these entries are of a somewhat unusual nature, their exact purpose should be plainly indicated in the explanation columns. According to the methods mentioned above, the various correcting entries are made directly on the face of the ledger. It is often preferable, however, first to make the required correction entries in the journal with full explanation, and then to post them to the ledger.

=Adjusting Entries Illustrated.=—In order to indicate clearly the routine and method to be followed in summarizing the books at the close of the fiscal period, the formal adjusting and closing journal entries needed for the books of U. R. Smart will now be set up, the illustrative data being the same as were used for the work sheet in Chapter XXVII to which reference should be made. In connection with the work sheet it was stated that the adjustment columns of the work sheet are used as a guide to making the adjusting entries. As to sequence in the journal, these follow immediately, without break, the last current entry for the month. The adjusting entries for U. R. Smart are:

Purchases 30,000.00 Merchandise Inventory 30,000.00 Merchandise Inventory 26,500.00 Purchases 26,500.00 Depreciation 3,630.00 Depreciation Reserve Office Furniture and Fixtures 280.00 Depreciation Reserve Store Furniture and Fixtures 1,200.00 Depreciation Reserve Delivery Equipment 750.00 Depreciation Reserve Buildings 1,400.00 Bad Debts 482.88 Reserve for Doubtful Accounts 482.88 Interest Income (Accrued) 150.00 Interest Income 150.00 Insurance (Deferred) 250.00 Insurance 250.00 Advertising (Deferred) 300.00 Advertising 300.00 Printing and Stationery (Deferred) 150.00 Printing and Stationery 150.00 Selling Supplies and Expense (Deferred) 200.00 Selling Supplies and Expense 200.00 Taxes 340.00 Taxes (Accrued) 340.00 Salesmen's Salaries 175.00 Salesmen's Salaries (Accrued) 175.00 Interest Cost 50.00 Interest Cost (Accrued) 50.00 Special Police on Strike Duty 150.00 Special Police on Strike Duty (Accrued) 150.00 Office Salaries 100.00 Office Salaries (Accrued) 100.00 Sub-Rentals Income 50.00 Sub-Rentals Income (Deferred) 50.00

=Purpose of Summarizing.=—After the adjusting entries are posted, the ledger reflects the true financial condition as of the date of these entries. However, at this stage the information contained in the ledger is usually scattered over a large number of accounts. To obtain a concise view of the results of the business, it is necessary to summarize this information. The Profit and Loss _account_ is the means by which the temporary proprietorship accounts are summarized and the net results as to profits or losses are indicated.

In this connection it will be remembered that the adjusting entries have already effected a separation of the elements of the mixed accounts, so that the temporary proprietorship items—expenses and income—applicable to the current period are now separately shown. The transfer of these _temporary_ proprietorship items to the _vested_ proprietorship accounts constitutes the work of closing. The use of the Profit and Loss account as a place of summary—a clearing house—through which the _net_ result can be passed on or transferred to the vested proprietorship accounts, constitutes a part of the method or technique of closing.

=The Closing Entries.=—The student is already familiar with the principles of debit and credit involved in making the closing entries. As indicated above, these are transfer entries and merely effect a transfer of all temporary proprietorship items to the Profit and Loss account for summary there and for the transfer of the net result to some vested proprietorship account or accounts. Like all other entries, these are made first in the journal and are posted from there to the ledger. The current sections of the various expense and income accounts are then ruled off and the ledger is said to be “closed.”

=Method of Closing the Books.=—As explained on page 129, the Profit and Loss account in the ledger is used for summarizing the temporary proprietorship accounts before transferring them, i.e., their net result, to the vested proprietorship accounts. The use of Purchases and Sales accounts for a partial summarization of the various merchandise accounts has also been explained. After this partial summarization has been made, the debit balance of the Purchases account, showing cost of goods sold, is transferred to the Profit and Loss account; and similarly, the credit balance of the Sales account, representing net sales, is transferred to the Profit and Loss account. Profit and Loss then shows on the credit side net sales and on the debit cost of goods sold, the difference being the income portion, i.e., the gross profit of the merchandising activities for the period. If it is desired to show on the face of the account the actual figure of gross profit, the Profit and Loss account may be balanced at this stage, though this is not usually done. The rest of the work of summarization is accomplished directly through the Profit and Loss account.

=Closing Entries Illustrated.=—The formal journal entries necessary to effect this summarization in the ledger are given below, being based on the illustration used for the work sheet and being made up directly from the various sections of the formal profit and loss statement shown on page 234. The way in which this is done should be carefully noted. As to their sequence in the journal, these closing entries will, of course, immediately follow the formal adjusting entries illustrated above.

Purchases 1,350.00 In-Freight and Cartage 1,350.00 Purchase Returns and Allowance 5,400.00 Purchases 5,400.00 Profit and Loss 134,450.00 Purchases 134,450.00 Sales 1,850.00 Sales Returns and Allowances 1,850.00 Sales 193,150.00 Profit and Loss 193,150.00 Profit and Loss 25,225.00 Salesmen’s Salaries 13,675.00 Selling Supplies and Expense 1,400.00 Advertising 4,500.00 Out-Freight 400.00 Delivery Expense 3,300.00 Depreciation 1,950.00 Store Furniture and Fixtures 1,200.00 Delivery Equipment 750.00 --------

Profit and Loss 18,560.00 Office Salaries 5,100.00 Office Expense 4,500.00 General Expense 2,000.00 Printing and Stationery 600.00 Taxes 3,180.00 Insurance 1,500.00 Depreciation 1,680.00 Office Furniture and Fixtures 280.00 Building 1,400.00 -------- Profit and Loss 2,367.88 Interest Cost 950.00 Sales Discount 850.00 Bad Debts 482.88 Collection and Exchange 85.00 Interest Income 1,650.00 Purchase Discount 1,300.00 Profit and Loss 2,950.00 Profit and Loss 1,350.00 Special Police on Strike Duty 1,350.00 Sub-Rentals Income 600.00 Profit and Loss 600.00 Profit and Loss 14,747.12 U. R. Smart, Personal 14,747.12 U. R. Smart, Personal 4,247.12 U. R. Smart, Capital 4,247.12

It will be noted that after the net sales and cost of goods sold are transferred to the Profit and Loss account, all expenses directly connected with sales, such as Salesmen’s Salaries, Advertising, Delivery Expense, Depreciation of Delivery Equipment, of Store Furniture and Fixtures, and similar items, are closed into the Profit and Loss account.

The groups of accounts closed next are those covering General Administrative Expenses, Financial Management Expenses, Financial Management Income, Non-Operating Expense, and Non-Operating Income. It will be noticed that the _order_ of closing follows the order in which the same items appear in the profit and loss statement.

The Profit and Loss account now shows on the credit side the items of income and on the debit side the costs and expenses applicable to the current period. Its balance then gives the net profit (or loss) covering the period's transactions.

Throughout the period, as the profit accrues, the proprietor may have drawn against it for personal use, as shown in his Personal account. To show the amount of profit remaining in the business, the balance of the Profit and Loss account is transferred to the Personal account, the balance of which then gives the amount of undrawn or overdrawn profit. The balance of the Personal account is closed into the Capital account, the credit balance of which then represents the net worth of the business at the end of this period and at the commencement of the next.

=The Profit and Loss Account.=--In posting the closing journal entries to the Profit and Loss account in the ledger, usually only the group totals as indicated by the entry will appear. In small concerns where expenses and income are not classified in much detail, the individual items composing the group total are often shown. These items are, of course, the same as appear in the part of the journal entry which is contra to the group total charged or credited to Profit and Loss. The ledger Profit and Loss account for the illustration will appear as follows when completely posted:

[Illustration: Form 28. Profit and Loss Account in Ledger]

=Profit and Loss Not an Account for Current Entry.=--It should be kept clearly in mind that the process of closing the books is merely a method or device by which the transactions for the year are _summarized_ and the net result determined. This net result, whether a profit or a loss, belongs to the proprietor and must ultimately be shown in his account. It is, therefore, manifest that the Profit and Loss account is _only_ a summary account and should never be used for current entry. It is the means by which the _temporary_ proprietorship accounts are summarized and the medium through which the net result is cleared into some vested proprietorship account or accounts.

=Effect of Closing the Ledger.=--The transfer of net profit to a vested proprietorship account completes the work of closing the ledger, all temporary proprietorship accounts for the _current_ period being closed out. All open balances now shown on the ledger constitute either assets, liabilities, or vested proprietorship. A post-closing trial balance contains only the accounts shown on the corresponding balance sheet. The income and expense accounts, having been cleared of their current record, are prepared to receive the record of the next period. The business cycle for this particular business has been completed and its correct history recorded.

CHAPTER XXIX

TYPES OF ACCOUNTING RECORDS AND THEIR DEVELOPMENT

=Evolution of Analytical Journals.=--Though the only books absolutely necessary for an accounting record under the double-entry method are the journal and the ledger, even the small business finds some subdivision of the journals advantageous, and so makes use of sales, purchases, and cash receipts and cash disbursements journals. As a business grows and its transactions increase in volume and complexity, further subdivision is needed. When the scope of its organization becomes too great for a personal oversight, a method or system must be devised for keeping the proprietor or manager in close touch with the various departments and lines of business endeavor. This is accomplished by means of reports from the accounting department, which exists largely for the purpose of furnishing this kind of information.

=Principle to be Followed in Securing Analysis.=--In an earlier chapter it was laid down as a fundamental principle that the information desired by the management should be furnished from analytical records made at the time of original entry, rather than by analyzing a composite record at the time the information is wanted. Such analytical records make possible a quicker and more up-to-date report to the management, and they save labor in securing the information by making the analysis at the time of record when all the facts related to it are readily available.

=Types of Sales Journals and Methods of Handling.=--The first step in the analysis of business transactions is the subdivision of the general journal into separate journals, and this analysis is carried still further by the use of columnar journal records. Reference has already been made, in Chapter XVIII, to the use of additional columns in the sales and purchase journals. Here a brief sketch will be given of the methods of recording sales in various kinds of sales journals.

1. The earliest type of sales journal, not often used today, consisted of a letter impression book containing the press copy of invoices sent to customers, with columns for the extension of the amounts and sometimes with additional columns for purposes of analysis. Such a journal has the advantage that the original entry is an exact copy of the invoice. Oftentimes, however, the impression is poor and nearly or quite illegible; it takes much room; the detail shown is not often used; and it increases the work of making and handling the record.

2. Another method makes use of a perforated invoice book with a columnized interleaf solid-bound between the perforated invoice sheets. The sales invoice is written on one of the perforated sheets and a carbon underneath gives a duplicate on the interleaf, the latter constituting the formal sales record. The advantages and objections are practically the same as for the impression book method.

3. Another method is to make a separate carbon copy of each invoice and use the duplicate as the source of entry in the sales journal. The journal entry gives only the file number of the duplicate invoice so that in case of need the duplicate can easily be referred to. Such a sales journal may, of course, contain analytical columns with any desired heads.

4. Still another method uses the duplicate invoice for posting to the customer's account, after which it is filed in binders. The latter are usually provided with recapitulation sheets which show the totals and analysis for each day, week, or month as the case may be. Just as above, the invoice file provides the detail in support of the ledger account and the recapitulation sheets constitute the journal from which credits to the various sales accounts are made. Either one of these last two methods eliminates most of the objections and embraces most of the advantages of the other methods mentioned above.

Where several sales ledgers are used, the sales journal is sometimes subdivided on the same basis as an aid in posting and for the purpose of securing controlling figures as explained in following chapters.

=The Sales Returns and Allowances Journal.=--The use of any special form of sales journal, particularly if it provides for an analysis of the sales, requires a similar record of sales returns and allowances. Either a separate book, similar in form to the sales journal, may be employed for recording these items or the pages in the back of the sales journal may be used instead.

=Development of the Purchase Journal.=--The development of the purchase records from the old-time scrapbook for invoices to the modern analytic voucher record resembles the development of the sales journal. The old-fashioned invoice book was usually a big, loose-bound, coarse paper volume in which were pasted the invoices for goods bought. An extension column was provided for the amount of the invoice, and the total of this gave the purchases for a given period. The use of columns for various classes of purchases provided the required analysis, but, as it was a cumbersome, nondescript record, it was bound to give place to something better--the formal purchase journal or register of today.

The purchase journal or register consists of a bound or a loose-leaf book ruled to suit individual needs and purposes. Where sales are analyzed by classes, an exactly similar analysis of purchases must be made in order to secure a gross profit figure for each class. Therefore its form follows very closely that of the sales journal. Entries are made in the purchase journal of the name of the creditor, the amount of his invoice, and the number of the file where the invoice can be found in case of need.

Where a separate purchasing department is maintained, the duplicate purchase orders, corrected if necessary to correspond with the purchase invoice received, may be used as the basis of the purchase journal. In this case recapitulation sheets are inserted just as with the sales journal. The handling of purchases is simplified by the fact that as a rule they are much smaller in number than sales. The same general considerations apply to the handling of returned purchases as to returned sales.

=Handling Expenses through the Purchase Journal.=--It is the practice of some concerns to treat expenses such as labor, rent, salaries, supplies, etc., as purchase transactions. Under this method, instead of postponing the entry until the item is paid, it is made at the time of securing the service or supplies. The basis for the entry may be either: (1) the bill or purchase invoice; (2) a formal purchase memo or voucher made out for each transaction; or (3) the fact that the expense has been incurred may suffice for the entry on the books with no formal paper to vouch for it. The use of such formal papers as the basis for entry is known as the voucher record system. The details of this system are fully explained in the second volume. Discussion is here limited to a brief outline of the method and of the advantages of its use.

When expense invoices are entered and analyzed in the voucher record form of purchase journal, their posting requires debits to the various expense accounts and credits to the individual creditors' accounts in the ledger. If the ledger contains only a controlling account, this account must be credited with the total of the expense and other purchases, while the individual accounts in the

creditors subsidiary ledger must be credited with the details which make up the total. When the bill is paid, entry in the cash book will not be, as usual, to the debit of the expense account in the general ledger, but to the debit of the creditor's account in the subsidiary ledger. The reason for this procedure will be made clear in the discussion of controlling accounts to follow.

The entry of expense invoices in the above manner secures an immediate record of all liabilities as incurred and therefore makes the books show at all times the true state of affairs as regards liabilities. The method, however, necessitates a little more work in making the record, and for this reason many concerns do not enter expenses until paid, making the debit to them through the cash book. In this latter case all unpaid expense bills should be kept in an expense file for reference when information as to the unrecorded liabilities is desired.

=Note Journals.=--As explained previously, note journals are sometimes used instead of the general journal for the record of note transactions, where these are sufficiently numerous. Provision is sometimes made for securing a proper analysis in order to distinguish between notes from customers and notes from other sources. It will be seen later that such an analysis is necessary when controlling accounts are operated.

=Analysis in the Cash Book.=--The cash journals may be ruled to furnish any desired analysis, showing on the debit side (i.e., the cash receipts journal) the sources of receipts, and on the credit side the objects of expenditure. As the sources of cash receipts are usually more limited than the objects of expenditures, they do not require so much analysis. The analysis may be very detailed, the only limit to the number of columns being the width of the page. A minute analysis of expenditures, however, is usually made, not in the cash journal, but in the purchase or voucher record, which thus relieves the cash book of a mass of detail.

The chief advantage of using additional columns in books of original entry lies in the fact that time and labor are saved in posting. The column total is posted in one item, whereas each of the numerous items composing it would have to be posted separately to the account named in the column heading if no analytical column were provided. Hence it would be a waste of space to provide separate columns for items which recur so infrequently as to make their summarization unnecessary. Care should be taken to avoid needless columnization.

It is customary to have the following columns on the debit side of the cash book: General or Sundry, Accounts Receivable, Sales Discount, and Net Cash or Bank; on the credit side: General or Sundry, Accounts Payable, Purchases Discount, and Net Cash or Bank. (See page 282 for illustration.) The proof of the distribution is secured by checking the sum of the net cash and discount columns against the sum of the totals of the other columns. In both receipts and disbursements journals every item must appear in the respective Net Cash columns, and from these distribution is made to the other columns. For example, in the cash receipts journal, receipts from customers are distributed into the Accounts Receivable column for the gross amount of each item, and into Sales Discount for the discount, if any is taken. All other items are carried into the General or Sundry column. Where several sales ledgers are kept, additional columns may be provided so that instead of having one accounts receivable column, there are columns for each ledger. Similar treatment is given to the disbursements.

=Analysis in the General Journal.=--Where the general journal is used for returned goods, allowances, and other adjustments with customers and creditors, use is made of analytic columns with these captions for both the debit and credit: Accounts Receivable, Accounts Payable, and General. Here, however, there is no column in which to enter all items for distribution to the other columns. If a customer's or a creditor's account is affected, entry is made in that column in the first place. All _other_ entries are in the General column. (See page 281 for illustration.)

With regard to analysis columns in the general journal, some accountants maintain, with good reason, that if the number of transactions of a particular kind is sufficiently large to justify their segregation in a separate column, this in itself would be ample justification for the use of a separate journal to record these items. Whenever the analysis of recurring transactions in the general journal is facilitated by the use of separate columns, the advisability of opening a new journal for the record of such items as appear in the general journal most frequently should be considered.

=Subdivision of the Ledgers.=--The next step in the subdivision of the records is made in the ledgers. The general or impersonal accounts of the business are of a more permanent character than the accounts with persons--customers and creditors. Consequently, when once it is determined under what account titles information is desired and those accounts are set up, there is usually little need to change their titles. Personal accounts, however, are constantly changing as some customers are lost and new ones are added, and also because creditors change with purchases in new markets. Hence, when a business outgrows its small beginnings, it is customary to keep these changing accounts in separate books. The basis for the first subdivision of the ledgers,

therefore, is the separation of the accounts into personal and impersonal. The accounts with customers are carried in a separate ledger called variously the sales, customers, or accounts receivable ledger, and those with creditors in a ledger called purchase, creditors, or accounts payable ledger. All other accounts are kept in the main ledger known as the general ledger. One advantage of this subdivision is that several bookkeepers can work on the various ledgers at the same time.

A further subdivision of the customers ledger is frequently made into “city” and “country,” the former containing the accounts with customers located within the city where the business is situated, and the latter the out-of-the-city accounts. Other subdivisions may be made on an alphabetical basis, i.e., customers ledger No. 1, containing all accounts from A to G; customers ledger No. 2, H to M, etc. Sometimes the concern’s sales territory is divided into arbitrary districts and the ledgers are subdivided to correspond with such districts.

[Illustration: Form 30. Standard Ledger--Center Column]

[Illustration: Form 31. Balance Ledger Rulings]

[Illustration: Form 32. Balance Ledger Rulings]

=Kinds of Ledgers.=--There are several kinds of ledgers, which may be classified (1) as to their rulings, and (2) as to their bindings.

1. RULINGS. As to their rulings, ledgers are either standard, balance, or progressive. The standard ruling has two duplicate parts, a debit and a credit, and is usually divided in the center of the page, one money column appearing at the extreme right of each part, although sometimes the arrangement is symmetrical with both debit and credit money columns at the center, and the date columns at either side of the page. (See Forms 29 and 30.)

The balance ruling is a three or four-column ledger with the money columns either at the center or at the right-hand margin, or at both the center and the right-hand margin. The extra columns are for the account balances. If the balance is usually either a debit or a credit, only one balance column would be necessary; where it is apt to be a debit at one time and a credit at another, a debit balance column and a credit balance column are advantageous. The balance ruling is used particularly with personal accounts where there is need for an up-to-date balance. Where this kind of ledger is used, entry of new debits or credits should always be on the next blank line as shown in the balance column, so as to allow the extension of the new balance opposite the last entry even though this should leave blank several of the preceding lines on the debit and credit sides. Typical forms of some of these are shown in Forms 31 and 32.

The Boston, progressive, or tabular ledger, as it is variously called, makes provision for a _horizontal_ progress of the account as to sequence of time; the title of the account is written at the left-hand margin, and one or more lines are allowed to each account according to the degree of its activity. The account title is written once at the left margin of the master or main sheet, and is sometimes repeated at the right margin if the sheet is very wide. The page is divided into columns for each day of the period. To effect this, short-margin insert sheets must be bound in to give the desired room for accommodating a whole period’s record. This style of ruling was formerly much used in banks where a daily balance for each depositor’s account was necessary. It is capable of adaptation to other uses, however. One form is shown, Form 33.

[Illustration: Form 33. Boston Ledger Sometimes Used for Depositors]

2. BINDINGS. Ledgers may be classified also as solid-bound, loose-leaf, and card, the titles being self-explanatory. One of the great advantages of the loose-leaf and card ledgers over the solid-bound ledger is their flexibility. They lend themselves easily to any desired grouping of the accounts; they may be numerically arranged where accounts are numbered instead of named; they may be arranged as to classes and each class made self-indexing; or a geographical grouping may be made. Another great advantage of this form of ledger is the ability to discard or file away in other binders all “dead” accounts, thus making for ease and facility in the use of the “live” ledger. Also it is possible for several clerks to work simultaneously, since the leaves or cards are removable and may be distributed among any number of clerks. There is always the danger, however, of failure to return a leaf or card, or of placing it out of regular order when returning it, or of destroying it, if it were desired fraudulently to do away with any particular account. The use of loose-leaf and card ledgers for personal accounts is pretty thoroughly established, notwithstanding the disadvantages just mentioned.

CHAPTER XXX

CONTROLLING ACCOUNTS

=Introductory.=--Reference to controlling accounts has been made several times in preceding chapters. It is purposed now to define them and explain their use. The separation of the various journals on the basis of an analysis of transactions frees the general journal of a vast mass of detail it formerly carried. This separation, however, in no way affects the underlying debit and credit scheme of the whole system. Each journal is an integral part of the whole; every entry therein has its equal debit and credit which are in due course posted to its proper account, thus maintaining the equilibrium of the ledger. The separation of the ledger into three or more special ledgers in the interest of economy of effort and ease of use has also been mentioned. Still, each of these special ledgers is an integral part of the whole ledger and the accounts in the special ledgers must be entered in the trial balance to secure proof of equilibrium.

The customers ledger is usually the most active of the various ledgers, i.e., more postings are made in it because the majority of business transactions involve dealings of various sorts with customers, and more accounts are required to keep the records with customers. It is usually, therefore, the largest part of the whole ledger, but its accounts are all of the same kind, viz., accounts receivable. When taking a trial balance, the total of the balances of the customers ledger accounts is usually set up under the title “Accounts Receivable,” leaving the details to a supplementary list or schedule.

=Advantage of a Controlling Account.=--The advantage of thus condensing the trial balance is apparent and suggests the desirability of obtaining the “accounts receivable” balance independently of the customers ledger. If this is done the bookkeeper in charge of the general ledger can not only draw up his trial balance without reference to the customers ledger, but has also the correct figure for the total of the account balances in the customers ledger. In other words, he has a figure which controls the customers ledger and which therefore furnishes him with a check on the accuracy of the ledger clerk or bookkeeper who keeps that ledger. The most convenient method of recording the accounts receivable figure is evidently by means of a formal account on the general ledger. When such an account is kept, the effect is to make it a summary account whose detail is carried in the customers ledger.

=Controlling Account Necessitates Changed Idea of Ledger Equilibrium.=--By having a customers controlling account (or “Accounts Receivable” as it is commonly called, though other terms are also used) in the general ledger, the customers ledger is no longer used as an integral part of the whole ledger and becomes a “subsidiary” ledger; that is, its function is reduced to that of a supporting schedule or list of detail for the summary controlling account. The equilibrium of the general ledger is now maintained by summary posting to the controlling accounts. Though the customers ledger has ceased to be a “ledger” in the proper sense of the term, it is still a vital part of the system, carrying as it does the detail of the summary controlling account. Moreover, it is linked up to the system by being provable against its summary account. Yet it should be borne in mind that its scheme of debit and credit is now an independent one and is not linked up to the debit and credit equilibrium of the general ledger; that is, the postings in the subsidiary ledger are merely memorandum entries of the detail posted in summary form to the general ledger. Thus the mathematical basis of the controlling account is simply that the whole is exactly equal to all its parts, the balance of the summary account being equal to the total of the balances of all the customers’ accounts of which it is the summary. To illustrate, if we have customers’ accounts whose balances are $1,000, $2,000, $3,000, $4,000, and $5,000 respectively, then the summary account must have a balance of $15,000.

=Debits to the Controlling Account.=--The principle and the purpose of the controlling account having now been explained, the next problem to consider is how best to gather the summary figures for its debits and credits. If every debit to a customer’s account must be posted also to the controlling account and every credit to a customer’s account must be shown as a credit in the controlling account the work involved would be almost doubled and little would be gained by thus duplicating the postings in another ledger. Therefore it is important to secure the figures for entry in the controlling accounts with the least effort, i.e., in the form of debit and credit summaries. Hence, to determine the sources of these debits and credits of the controlling account, analysis must be made of the sources of the debits and credits to the customers’ accounts.

Most of the debits to customers’ accounts are from the sales journal. Additional debits may be from the cash disbursements journal when cash payments are made as a rebate or a refund for overpayment or some other similar transactions; still others from the general journal for adjustments of various kinds. The debits to customers, however, for cash paid them are very few in number, because such adjustments usually are not made by means of cash payments. The sales journal, as usually operated, carries a

column for credit sales, whose total represents in one amount the total of all detailed debits to customers' accounts. The total of the credit sales column, therefore, controls the total debits to all customers on account of charge sales to them. In summarizing the sales journal the summary entry should show that this total is to be posted not only to the credit side of the Sales account but also to the debit of the controlling account in the ledger. This is so because the customers ledger has ceased to be an integral part of the general ledger, the controlling account having taken its place. Accordingly, the general ledger contains no record of either the debits or credits of the entire group of sales transactions until the end of the month, when this group must therefore be brought into the general ledger in summary form, both debit and credit.

Where the total sales in the sales journal include an analysis of sales into cash sales and credit sales, the following summary entry should be made:

Accounts Receivable Cash Sales

The cash debit is set up only to show the equilibrium of the summary entry and is not posted, because it is entered also in the cash book and is posted from there. This debit posting to "Accounts Receivable" in the general ledger secures in one posting a debit amount equal to all individual debit postings to the customers ledger from this source. The controlling account in the general ledger is variously termed "Sales Ledger," "Accounts Receivable," "Trade Debtors," "Customers," etc.

The two other sources of debit posting to customers' accounts are the general journal and the cash book. The debit side of the journal is provided with an Accounts Receivable analysis column in which, as explained in the previous chapter, debits to customers' accounts are entered. At posting time the total of this Accounts Receivable column will therefore give in one figure a debit posting item to the general ledger Accounts Receivable account equal to all individual debit postings from the general journal to customers' accounts in the customers ledger.

Usually it is not necessary to provide an Accounts Receivable column on the credit side of the cash book, since debit postings from there to customers' accounts are very infrequent. Hence no total or controlling figure for entry in the Accounts Receivable account can be obtained. Every item which is posted from this source to the debit of a customer's account must be also posted--item by item--to the debit of Accounts Receivable in the general ledger. This is of course a double debit posting, but one of these debits is to a subsidiary ledger which is no longer a part of the equilibrium scheme and therefore does not throw the general ledger out of balance. Great care must be exercised to make sure that each of these items is posted both to a customer's account and also to the Accounts Receivable account.

=Credits to the Controlling Account.=--An analysis of the credits to customers' accounts shows four main sources:

1. The cash receipts journal for payments made by customers.

2. The sales returns journal, if one is kept, for goods returned by customers.

3. The note journal for notes received in payment.

4. The general journal for various adjustments and also for the purpose of recording notes and returned sales where special journals are not kept for these transactions.

Accordingly, analytic columns for accounts receivable are provided in the cash receipts journal and the general journal. The totals of their columns are posted to the credit of Accounts Receivable, and the detailed amounts to the credit of the various customers' accounts. The credit postings from these sources to the customers ledger accounts and to the general ledger Accounts Receivable account are therefore the same so far as totals are concerned. The sales returns journal is summarized at posting time by means of an entry similar to that in the sales journal, as follows:

Sales Returns Accounts Receivable

In this case the credit posting to the Accounts Receivable account is equal to the detailed credits to customers' accounts.

Similarly, a summary entry for the notes receivable journal secures a controlling figure for Accounts Receivable. If the notes are all received from customers to apply on their accounts, the summary entry is:

Notes Receivable Accounts Receivable

the amount being the total of that journal.

In this way the total of all debits and of all credits to the individual customers' accounts is represented by the summary items entered in the general ledger controlling account, Accounts Receivable. Consequently, the balance of this single account is equal to the balance of the customers ledger. For the trial balance, therefore, one account takes the place of hundreds or even thousands of customers' individual accounts. As a result of this, much time is saved and the possibility of error on the general ledger is greatly reduced.

=Proving the Customers Ledger.=--The use of a controlling account in the general ledger, however, does not eliminate the necessity of proving the accuracy of the customers ledger. It merely makes it possible to take a trial balance without bringing the numerous customers' accounts into it. It is just as much a part of the proof of the work to make a list of customers' accounts balances and check it against the balance of the Accounts Receivable general ledger account, as it is to prove the general ledger by means of a trial balance. If there is a discrepancy between the subsidiary ledger and its controlling account on the general ledger that discrepancy does not necessarily prevent a trial balance of the general ledger, but it does show error in the work which must be searched out and corrected.

=Accounts Payable Account.=--A similar arrangement will make possible a controlling account on the general ledger for the creditors or purchases ledger. This account is variously termed Accounts Payable, Purchase Ledger, Creditors, or Trade Creditors account. Its mechanism is the same as for Accounts Receivable. Analysis of credit postings to creditors' accounts shows the purchase journal as their main source. Other credits come through the general journal and a very few through the cash receipts journal. The summary entry for the purchase journal is:

Purchases Accounts Payable Cash

This shows a debit to the Purchases account for the total amount of the purchases, a credit to Accounts Payable for the liability to creditors, and to Cash for the amount paid on cash purchases. The cash item is not posted. The Accounts Payable column total on the credit side of the journal, and the separate items from the cash receipts journal, furnish the other credits to the Accounts Payable account in the general ledger.

The debits come from the Accounts Payable columns in the cash disbursements journal and in the general journal, and the summaries for the notes payable and purchases returns journals.

=Basic Principle as to Postings to Controlling Accounts.=--In the handling of controlling accounts, the one fundamental requirement is to make sure that every entry in books of original entry which affects any account in the subsidiary ledger is reflected in the postings to the controlling account in the general ledger. This principle resolves itself into the mathematical axiom stated above that a whole is equal to all--not just some--of its parts. Only thus can a true control be established.

=Making the Subsidiary Ledger Self-Balancing.=--Through the use of the two controlling accounts explained above, the trial balance is relieved of a large number of accounts, and the general ledger is made independent of the subsidiary ledgers. On the other hand, the subsidiary ledgers are dependent for their proof on the controlling account balances in the general ledger. In an effort to make every ledger "self-balancing," a further refinement of the controlling account idea is frequently incorporated in each subsidiary ledger. It is accomplished in the following manner: An exact duplicate of the controlling account on the general ledger is set up in the subsidiary ledger, _with this difference_, that the sides of the account are reversed so that the subsidiary ledger account has for its debits the credits of the general ledger account, and for its credits the debits of the general ledger account.

Take the Accounts Receivable controlling account for illustration. On the general ledger its balance is of course a debit balance representing the total outstanding accounts due from customers. Similarly, the schedule or list of customers' accounts taken from the sales ledger will represent debit balances whose total is the same as the controlling account balance. If, then, the controlling account itself is placed on the customers ledger as an additional account, the sides being reversed, the balance of this one account will be a credit equal to the total debit balance of all the other accounts in the customers ledger. Therefore, if the customers ledger is correct, its own balance will be offset exactly by the credit balance of the one additional account, and the ledger then is said to be self-balancing. There is no theory or principle of debit and credit involved in this; the device is simply introduced in order that the ledger may provide an internal proof of its correctness. The title of the balancing account on the subsidiary ledger is "Adjustment" or "Balance" and has no significance other than that mentioned. In a similar manner any subsidiary ledger may be made self-balancing.

CHAPTER XXXI

HANDLING CONTROLLING ACCOUNTS

Chapter XXX concerned itself with the statement and explanation of the principles on which the controlling account rests, the manner of its construction, its advantages, and with the changed application of the fundamental scheme of debit and credit under a system of records operating controlling accounts. The present chapter will be devoted to a consideration of the problems met with in the practical operation of these accounts.

=Introduction of the Controlling Account.=--Upon the installation of a new system or set of books, the controlling account feature may be incorporated from the start. The new system must provide for the separation from the general ledger, of the ledgers over which control is to be established. The method of securing controlling totals for posting to the general ledger controlling accounts was indicated in the preceding chapter.

Where it is desired to introduce controlling accounts into a system which has not formerly used them, certain adjustments must be made, i.e., the accounts to be controlled must be segregated and controlling account columns must be provided for in the books of original entry. With the transfer of these accounts to a separate ledger, together with the introduction of the controlling accounts into the general ledger, the equilibrium of that ledger is maintained. The opening entry in the newly established controlling account is of course the sum of the balances of the transferred accounts.

If it is desired to establish the new controlling account by journal entry, that entry would appear somewhat as shown on page 279, Form 34, with suitable explanation added. All these items should be posted to the general ledger as shown by the entry, and in addition the detailed items should be posted as debits to the accounts in the customers ledger. The effect of these postings would be, first, to close the individual customers' accounts formerly carried in the general ledger and open up in their stead the controlling account; and second, to set up on the subsidiary ledger the detail of the customers' accounts.

=Recording Withdrawals of Stock-in-Trade.=--The original basis for separating the main journal into its subsidiary parts was the analysis of transactions by kinds, such as sales, purchases, cash, etc. The sales journal was presumed to contain only sales of stock-in-trade. Departure from this principle was advisable in the case of goods drawn at cost, for use in the business or by the proprietor or for other purposes. This is done because withdrawals of stock-in-trade, at whatever price and for whatever purpose, can be recorded more conveniently in the sales journal than elsewhere.

It is theoretically incorrect, however, to enter such items in the Sales account because withdrawals at cost do not represent actual sales, and for this reason they should be regarded as deductions from purchases or from inventory. The only proper place for their record, under this view, is the general journal, entry in which would have to be by detailed debit and credit for each item. However, because this requires much more work than entry in the sales journal, this last method is more commonly employed. Usually the volume of such transactions is not large and would not seriously vitiate the use of the Sales account as the basis for estimating percentages of cost of goods sold, gross profit, selling expenses, etc. Moreover, as the total amount of these withdrawals is often fairly constant as between periods their record in the sales journal is countenanced.

=The Problem of the Sales Journal Summary.=--When withdrawals from stock at cost price are recorded in the sales journal, a new problem arises in summarizing the sales journal when operating under a controlling account system. The customers or sales ledger is usually limited absolutely to customers' accounts. Accounts with the proprietors, and with all other titles under which withdrawals for other purposes may be recorded, are almost invariably carried in the general ledger. Therefore, while most of the items entered in the sales journal are posted to the customers ledger, these withdrawal items must be posted in detail to the general ledger. Thus the total of the sales journal does not represent the correct debit to accounts receivable in the general ledger. Evidently an analysis of the content of the sales journal must be made in order to obtain the correct controlling figure.

Such analysis may be made in several ways. Where possible, three columns in addition to the departmental columns should be used. The column titles would be "Sales Ledger," "Cash," and "Sundry." The sum of these three would give the total to check against the total of the other distributive columns, but only the "Sales Ledger" total would be posted to Accounts Receivable, and the individual items in that column would be posted to the customers' accounts in the sales ledger. The items in Sundry column would be posted to their named accounts in the general ledger. This method secures an automatic separation of the controlling account total from other items, and should be used where possible.

If the number of these extraneous items is too small to warrant the use of a separate column, they may be recorded in the Sales Ledger column and indicated by means of an "■" or some other mark. At summary time, the sales journal must be looked over and

these items picked out. Subtraction of their sum from the Sales Ledger column total would give the correct controlling account posting.

Still another method requires a correcting general journal entry at the time the sales journal entry is made. Under this method these special items are included in the Sales Ledger column, thereby causing an overcharge to Accounts Receivable. The correcting general journal entry must therefore credit Accounts Receivable by the amount of the overcharge for each item. For instance, if stock has been drawn by the proprietor, the general journal entry at the time the sales journal entry is made would be:

Proprietor, Personal Accounts Receivable

the debit to proprietor being checked here and posted from the sales journal, or vice versa. This method, however, results in a duplication of work. It would be preferable not to enter these items in the sales journal and to make the record only in the general journal, and so leave the Sales Ledger column total in the sales journal the correct controlling figure.

In a complicated controlling account system, where for current entry a simple bookkeeping routine must be established and all items of whatever kind be handled in the same way, the withdrawals by proprietors are recorded in accounts opened with them in the sales ledger just as with customers. At the end of the period, before closing the books, these proprietors' accounts are transferred by general journal entry to the general ledger, requiring one entry--like the one last shown above--for the drawings of the period.

Cash sales may also be handled without the use of a separate column in the sales journal. Two methods are used for this. Under the one, cash sales are included in the Accounts Receivable debit total of the sales journal, although the individual items are not posted to the subsidiary ledger, and they are also included in the Accounts Receivable credit total of the cash receipts journal. The inflated debit in the general ledger controlling account is thus offset by an equally inflated credit, the balance therefore being the correct amount to control the sales ledger.

Under the other method the postings to the general ledger controlling account are the same as in the first method. The two methods differ, however, in that under the second method an account is opened in the subsidiary ledger entitled "Cash Customers" or "Cash Sales," to the debit of which are posted in detail the cash sales items from the sales journal and to the credit of which are posted in detail the cash sales items from the cash receipts journal. The account is thus only a "wash" or clearing account. This method, however, prevents the inflated debits and credits in the controlling account.

The methods last described for handling proprietors' withdrawals and cash sales are the ones most frequently used in large businesses where simplicity of routine for current entry must be secured.

=The Problem of the Purchase Journal Summary.=--The practice of recording extraneous transactions in the purchase journal brings about at summary time a situation similar to that of the sales journal, when a controlling Accounts Payable account is maintained. The purchase journal is, and should be, the place of record for purchases made for the business. If the proprietor (or other person), for his personal account and use, purchases through the business merchandise which never goes into stock, accurate accounting requires such transactions to be charged direct to the proprietor and not to the Purchases account of the business. Inasmuch as the liability is assumed by the business and the creditor's account will appear in the purchase ledger, the use of the purchase journal total for credit to the Accounts Payable controlling account gives the correct figure. The trouble comes in because this same figure cannot be used as the debit to Purchases. Subtraction of these extraneous items must be made to determine the proper amount chargeable to the Purchases account, thus necessitating an analysis at summary time.

=Accounts Both Receivable and Payable.=--It frequently happens that purchases from, and sales to, the same party are made, i.e., goods are sometimes bought from and sold to a customer. If the account of this debtor-creditor is normally a purchase account, it is set up in the purchase ledger. If a sale is made to this debtor-creditor and charged to his purchase ledger account, such transaction should not be included in the Accounts Receivable controlling figure from the sales journal unless an adjusting entry is made through the general journal. Such entry would affect only the controlling accounts and would be:

Accounts Payable Accounts Receivable

Or the item might be omitted from the sales journal controlling figure and stated separately in the summary entry for the sales journal.

A more satisfactory method is to set up two accounts with such parties--one as a creditor, the other as a customer. Then no adjustment need be made at the time of summarizing the journals, because the two accounts are treated as entirely independent of each other. The settlement of these two accounts may be handled separately or by a payment of the balance between the two. If settled by balance, an adjusting journal entry should be made to show on the books the two separate elements involved. This would of course affect both the controlling accounts and the two individual accounts.

=The Problem of the Note Journals Summaries.=--Of notes receivable the large majority are usually received from customers. The summary entry for such is:

Notes Receivable Accounts Receivable

Where notes are received from other sources, as from officers, partners, or from outside parties to whom loans have been made, it is evident that these must not be included in the credit to Accounts Receivable, and it may be advisable also to eliminate them from Notes Receivable unless they are short-term, current items, as only such should be carried under Notes Receivable. These special notes may be carried in a “Notes Receivable Special” account.

If, as sometimes happens, interest is included in the face of a note, this must be adjusted by the summary entry, as follows:

Notes Receivable Accounts Receivable Interest Income

The considerations stated above as applicable to the notes receivable journal, are of equal importance in handling the notes payable journal. A very careful analysis of the note journals should be made at a summary time, which analysis should be shown by the summary entry.

=Summary Entries for Columnar Books.=--Illustration will now be given of some standard forms for summarizing the columnar journals. Sometimes the summary entries for the various subsidiary journals are made in the general journal. This seems to accomplish no good purpose and is not usually recommended. Theoretically it is desirable to show a formal debit and credit summary for each journal footing posted to the ledger. If, however, the number of columns is small and it is readily seen that the debits and credits are equal, the formal summary is often dispensed with. So also, if there are many distributive columns of the same effect, i.e., debit or credit, as in the large departmental sales journal or the voucher register referred to on page 144, formal summary is not shown, the posting being made from the column totals as illustrated for Petty Cash on page 369.

=The Sales Journal Summary.=--An illustration of the sales journal summary is given in Form 35. The Sundry items should be posted in detail from their column and their total checked in the summary entry. Where a Sundry column is not used and the Sundry items are included in the Sales Ledger column, they must be separated before the summary entry can be made.

[Illustration: Form 34. General Journal]

[Illustration: Form 35. Sales Journal Summary]

Where, also, a Cash column is not carried, as is so often the case, there being just one column for Sales Ledger, Cash, and Sundry items, from which distribution is made, the separation of the Cash items need not be shown in the summary entry, provided those items are entered also in the Sales Ledger column of the cash book. Where, due to the large number of distributive columns, the sales journal can ill afford the room for a Cash column, the above method offers the best solution of the problem.

The purchase journal summary is similar to that of the sales journal, and therefore no separate illustration need be given here.

=The General Journal Summary.=--As shown by the illustration in Form 36, in summarizing the general journal the Accounts Receivable and Accounts Payable columns are formally totaled, ruled off, and their totals brought into the General columns on both debit and credit sides and these columns are totaled and ruled off, thus showing the equilibrium of the journal. This summary entry is posted to the proper accounts in the general ledger. There is no particular advantage, however, in this formal summary entry because the postings could easily be made directly from the column totals.

=The Cash Book Summaries.=--As illustrated in Forms 37 and 38, the formal summary for each side of the cash book shows the equality of the Bank and Discount columns total against the General and Accounts Receivable and Payable columns. To show the correct debit to the bank for the present month, the balance brought forward from last month and entered in both the General and Bank columns on December 1, must now be subtracted from both.

On the disbursements side no explanation of the summary entry is necessary. It will be noted that, to show the balance of the bank account, a restatement of the Bank column total is necessary.

[Illustration: Form 36. General Journal Summary]

[Illustration: Form 37. Cash Summary Book--Receipts Side]

[Illustration: Form 38. Cash Summary Book--Disbursements Side]

=Other Controlling Accounts.=--It is frequently desirable to keep some accounts of the business private, such as those showing partners' investments, drawings, ratios of sharing profits, the adjusting and closing entries, the profit and loss, etc. This can be accomplished through the use of a private ledger supported by a private journal and sometimes a private cash book. For their operation a controlling account of the private ledger is set up in the general ledger, and similarly a controlling account of the general ledger appears in the private ledger. The use of private books is explained in Volume II of this work.

Sometimes subsidiary expense ledgers are used to carry a minute division of each expense group, with corresponding controlling accounts, such as Selling Expense, Office Expense, General Expense, Factory Expense. Similarly, if the consignment sales of a business are large enough to justify a separate record in a consignments ledger, a controlling account is set up in the general ledger. In a manufacturing business, Raw Materials, Goods in Process, and Finished Goods accounts are often controlling accounts for the stores, jobs, and finished stock ledgers. In a corporation the Capital Stock account (or accounts) is a controlling account over the stock ledger.

=Principle Governing Content of Subsidiary Ledgers.=--Before closing this chapter, it should be stated as a fundamental principle that no accounts should be carried in a subsidiary ledger except such as are of the same general kind and can without misrepresentation be carried under the group title of the controlling account.

CHAPTER XXXII

PARTNERSHIP FROM THE BUSINESS VIEWPOINT

=Partnership Defined.=--In Chapter II, reference was made to some of the features of a partnership--the purpose of its formation, advantages, disadvantages, etc. The laws of the state of New York define a partnership as follows: "A partnership, as between the members thereof, is the association, not incorporated, of two or more persons who have agreed to combine their labor, property and skill or some of them for the purpose of engaging in any lawful trade or business, and sharing the profits and losses as such between them."

This definition brings out in a general way the reasons for the formation of the partnership and its essential features. Under this type of organization, where several persons combine their capitals, it is possible to secure a larger fund of capital than under the sole proprietorship. This opens to the partnership avenues of business usually closed to the sole proprietor. The bringing together of the man with a special aptitude or skill, or of a man with a following in the community on account of social standing and acquaintanceship, with another who has money or a plant for the operation of a business, often makes successful an otherwise unpromising undertaking.

=Operating Feature and Working Organization.=--Mutual agency is the essential operating feature of the partnership. By this is meant that any one of the partners can act for the others, and in the eyes of the law all are equally responsible for the management of the business. Except in the case of a limited partnership, to be explained later, each partner has an equal voice in the management and control of affairs. Unlike the corporation where for management purposes the owners' powers are delegated to a controlling board, the essential character of the partnership is that each partner has, regardless of the amount of his investment, an equal right in the direction of its business. As between themselves, for purposes of division of duties and specialization of effort, definite power to exercise control over certain features of the business may be delegated to individual partners. But such delegation means nothing more than a method of dividing the work and is simply the working organization of the firm which may be changed at any time the majority of the partners see fit. Thus, while a partner may be limited in his actions for the firm by agreement among the partners, so that he is not a general agent for the firm, still as to outsiders who know nothing of this internal arrangement, he has power to bind the partnership by his acts, because an outsider has a right to expect that any partner has power to act as an agent for the firm. This is so because such power is of the essence of the partnership form.

=Essential Characteristics of the Partnership.=--Limited life is an essential characteristic of the partnership. The partnership relation is a very personal one. It can be terminated in a number of ways, but the death or retirement of any member automatically works a dissolution of the firm, even though another man takes his place. The legal theory is that the old partnership is dead and a new one, even though bearing the same firm name, has come into existence. Thus a partnership cannot be perpetual. The relationship between the partners is so intimate that the success of the undertaking depends fundamentally on the good faith and honor exercised by each partner towards the others, and therefore any addition to the personnel of a partnership can be made only with the consent of all members of the existing firm.

The partnership being the outgrowth of the sole proprietorship, certain of the aspects of its earlier form still cling to it. For suit at law it is looked upon as a collection of single owners, and action on contract must usually be taken against the individual members of the firm. Suit by or against the partnership cannot as a rule be brought in the firm name. Some states, however, allow this under recent enactments. Title to personalty can be held and transferred under the firm name, but realty must be in the name of the individual members or in the name of one member acting as trustee for the firm. Thus, while in the view of the business community the copartnership is a business entity under a firm name, in the sight of the law it is not an entity but merely a collection of single owners. This legal view accounts also for the full debt liability of every partner--except in a limited partnership. In case the firm assets are insufficient to meet the claims of creditors, any or all the partners' private resources may be levied upon.

Co-ownership of the profits of a business is another feature essential to the copartnership. No sharing in the profits on any other basis than that of co-ownership will constitute a partnership. When the question comes before the courts, the intention of the parties governs, and evidence showing that each acted as principal for himself and as agent for the others, and has shared profits as profits, would be sufficient to constitute the relationship.

=The Partnership Contract.=--A partnership being a contract relationship, all the requirements governing legality of contracts, such as agreement, consideration, lawful object, competency of contracting parties, etc., apply to the copartnership. The contract may be oral or in writing. In case of dispute an oral contract, on account of the difficulty of proof, is of little force in regulating the relations of the partners, and the general law of partnership would usually govern. Inasmuch as there is so great an opportunity for disputes in a relationship of this sort, it is imperative, if efficient working relations are to be maintained, that very carefully drawn articles of copartnership be agreed upon before active business is begun. These articles should contain, at least, the following:

1. The name of the firm and of the partners. 2. The kind and place of business. 3. The duration of the partnership. 4. The method of terminating it. 5. A detailed statement of the relations between the partners, such as duties and powers, capital contributions, withdrawals of capital, salaries, division of profits and losses, interest on capital, and the time of closing the books to secure a definite determination of the partners' interests.

Even when the utmost care is exercised in drafting the articles of partnership, it almost always happens that some portion is not understood alike by all or that some contingency arises not specifically provided for. Nevertheless, it is the only way in which a comparative avoidance of misunderstanding and dispute can be obtained.

=Partnerships Classified.=--As to the scope of their business operations, partnerships are usually classified into general and special. The general class embraces those for the conduct of some general or ordinary lines of business. The special class comprises those formed to undertake a definite task or some particular line of business. Joint ventures would come under this latter class.

As to the liability of their members, partnerships may be classified as general and limited. The general partner has the full liability, referred to above; the limited partner's liability never exceeds the amount of his investment. In a limited partnership one or more, but not all, members may limit their liability. This class of partnership can be formed only under direct authority of statute law. A limited partner is not active in the management of the business, being more in the nature of a lender of money to the firm, who gets his return in profits instead of interest. Should he become active in the firm's management, he will constitute himself an ordinary partner with full liability. The New York statute governing the formation of the limited partnership is as follows:

Two or more persons may form a limited partnership which shall consist of one or more persons of full age, called _general_ partners, and also of one or more persons of full age who contribute in actual cash payments, a special sum as capital, to the common stock--or fund--called _special_ partners, for the transaction within this state of any lawful business, except banking and insurance by making, severally signing and acknowledging and causing to be filed and recorded in the clerk's office in the county where the principal place of business of such partnership is located, a certificate in which is stated:

1. The name or firm under which such partnership is to be conducted and the county wherein the principal place of business is to be located.

2. The general nature of the business intended to be transacted.

3. The names, and whether of full age, of all general and special partners therein, distinguishing which are general and which are special partners, and their places of residence.

4. The amount of capital which each special partner has contributed to the common stock--or fund.

5. The time at which the partnership is to begin and end.

Affidavit of the payment of capital must be made and a notice of the formation of the partnership published in a paper of general circulation. The limited partnership is thus hedged about with safeguards for creditors, bankers, and other interested parties, particularly by the rule that a limited partnership cannot exist unless there are one or more general partners with full liability.

=The Joint-Stock Company.=--The joint-stock company is a partnership or association in which ownership, voice in the management, and profit-sharing ratio are evidenced by transferable shares of stock. Control and management are exercised through a board of directors chosen by the stockholders. If the company becomes bankrupt and the firm assets are insufficient to satisfy creditors, the members are personally liable to the full extent of their private property in the same way as in a general partnership.

The mining partnership is a form of joint-stock company which operates in mining communities. Usually the mining property itself is beyond the scope of such a partnership, only the development of this property by means of a lease being contemplated. Unlike the ordinary partnership, the members of a mining partnership may assign their shares of ownership. Upon their death or bankruptcy, their interests pass to others who take their place in the partnership without the consent of the remaining partners. Thus, the confidential relationship based on the right of selection of its members, characteristic of the ordinary partnership, is largely lacking in the mining partnership.

=Partners Classified.=--Finally, brief mention may be made of the following terms applied to partners to indicate varying degrees of activity within the ordinary partnership:

1. Ostensible partners--those who hold themselves out and are known to be partners.

2. Nominal--those who are known as partners but who have no real interest in the firm.

3. Dormant or silent--those who are not known to outsiders as partners and who take no active part in the management of the firm’s affairs.

4. Secret partners--those who are not known as partners to outsiders but who have an interest and take active part in managing the firm.

For more detailed information as to a partner’s rights, duties, and responsibilities to his copartners and to outsiders, a standard legal text on partnerships or business law should be consulted. The student should also read Chapter II in connection with this chapter and the next.

CHAPTER XXXIII

PARTNERSHIP FROM THE ACCOUNTING VIEWPOINT

From the fact that the law looks upon the partnership as a combination or collection of sole owners, some of the accounting problems arising out of the partnership form of organization are unique, and a partial or full treatment of some of these problems will be given in this chapter.

=Profit-Sharing in the Partnership.=--Of these problems perhaps the one occurring most frequently is that concerning the division of profits. Attention was called in Chapter XXXII to the need of explicit statement on this point in the articles of copartnership under the head of the intrapartnership relations. Since men combine their capitals for the purpose of realizing profits, it would naturally be supposed that all partnership agreements would be specific on that point. Yet it very often happens that many contingencies

relating to the matter of profit-sharing have not been foreseen and as a result disputes arise.

The fundamental principles governing profit distribution may be stated as follows:

1. Where the agreement is silent, the law provides that profits shall be divided equally among the partners regardless of the amounts of their respective investments of capital. Some partners may have made no investments of money or property, setting up their particular skill and aptitude or standing in the community as their share and contribution to the profit-earning capacity of the organization. Unless it is specifically agreed otherwise, these will share equally in any profits.

2. Where profits are to be shared in the same ratio as capital, the agreement should specify whether the basis of division is to be the original investments or the capitals as shown at the beginning of each period, which would be the original investments plus profits left in the business. This latter interpretation would usually result in a changing ratio for succeeding periods, whereas under the former interpretation the ratio of profit-sharing would be always the same.

3. Provision should be made, either in the original articles or at a subsequent time, for a change in the profit-sharing ratio in the event of a partner's withdrawing some portion of his original investment if such withdrawal is allowed. It may be stated here that an agreement between the partners as to any ratio for division of profits can be made at any time and will govern such ratio, but must be on a determinable basis.

4. Where the articles are silent as to the division of losses, the profit-sharing ratio governs. Where a different ratio is desired, specific statement of it must be made. Of course, upon the inception of an undertaking losses are not contemplated, but the experience of others should cause provision to be made for apportionment of losses in order to avoid possible difficulties or disputes.

5. Unless the articles--or subsequent agreements--provide for the payment of salaries to any or all of the partners, none are allowed.

6. The conditions governing the partners' drawings should be explicit as to the amount to be drawn during a given period. It should be stated explicitly whether excess drawings shall be regarded as a charge against capital, or as the basis for an interest charge, or simply as an excess drawing standing in the partner's current account without penalty other than a disallowance of future drawings until lapse of time brings the total amount drawn within the agreed limitations.

7. The manner of handling undrawn profits should be made definite. Are they to be transferred to the capital account and so be made a part of capital, resulting in changing capital ratios; or are they to be carried as open balances in the drawing accounts and thus take on the nature of temporary loans subject to withdrawal at any time?

=Average Investment as a Basis for Profit-Sharing.=--Attention should be called to a basis for profit-sharing sometimes employed for special partnerships, entered into for the performance of a specific contract or for doing any special work. In these cases the capital needed may not be known at the start, or if known may not all be required then but is to be furnished by whichever partner may have available funds at the time of need. In such cases the basis of profit-sharing may be made the amount of capital furnished by each partner and the length of time of its use in the enterprise. Two methods of determining the ratio may be employed.

FIRST METHOD. Each investment may be multiplied by the number of days occurring between the date on which the investment was made and the date of profit determination, giving a result which may be called "day-dollars" of investment in a sense similar to the term foot-pound in physics. From the total day-dollars of investment must be subtracted the day-dollars of withdrawals, arrived at similarly, thus showing net investment in terms of day-dollars. The sum of all the investments in day-dollars becomes the basis on which to prorate profits, each partner's share being the part which his individual net investments bear to this total net investment.

SECOND METHOD. The original investment of each partner may be multiplied by the time it remains unchanged, i.e., until it is added to or some portion is withdrawn. Similarly, this changed capital is multiplied by the time it remains fixed, and so for every change. The total of these items constitutes each partner's net investment, from which the profit-sharing ratio is determinable as above. In the problem given below, for purposes of illustration the dates are so taken that the calculation can be made on a month-dollar instead of a day-dollar basis, thus shortening the operation. The capital accounts of the partners, showing investments and withdrawals, are as follows:

A. B. CARD ========== 19— | 19— Jan. 15 2,500.00 | Jan. 1 10,000.00 Apr. 1 4,500.00 | Mar. 15 7,500.00 June 15 1,500.00 | June 1 5,000.00

D. E. FOLWELL ========== 19— | 19— Feb. 1 3,000.00 | Jan. 1 5,000.00 May 15 2,000.00 | 15 5,000.00 | Apr. 1 5,000.00 | June 15 2,500.00

Profits as on July 1, 19—, were $5,000. Determine each share.

SOLUTION (Using the second method)

Amount Months Month-Dollars A. B. CARD: $10,000 × ½ $ 5,000 7,500 × 2 15,000 15,000 × ½ 7,500 10,500 × 2 21,000 15,500 × ½ 7,750 14,000 × ½ 7,000 ------ ----- ------- 6 $63,250

D. E. FOLWELL: $ 5,000 × ½ $ 2,500 10,000 × ½ 5,000 7,000 × 2 14,000 12,000 × 1½ 18,000 10,000 × 1 10,000 12,500 × ½ 6,250 ----- ------- 6 55,750 -------- Total investment in month-dollars $119,000 -------- 63,250 Card's share of the profit: -------- of $5,000 = $2,657.56 119,000 55,750 Folwell's share: ------- of $5,000 = $2,342.44 119,000

The first method will, of course, give identical results. The second method has the slight advantage that the Investment Months column will always total the same as the length of the fiscal period, provided each partner makes his initial investment at the first of the period—which is not always the case—and acts as a check on the accuracy of that part of the calculation.

=Interest on Partners' Investments.=—A second problem of importance in connection with partnership accounting is the interest on partners' investments. The purpose of allowing such interest is twofold: First, it may serve as an indication of the excess of the profits in this enterprise over the return on the investment of a like amount in the money market, thus dividing the partnership profits into two parts, interest and management earnings; and second, it may serve as a method of distributing profits up to a certain amount on the basis of capital investments, where the agreed-on ratio is different from the capital ratio, thus distributing the period's profits on two different bases or ratios.

This is done sometimes to equalize somewhat the comparatively smaller-ratio profits of the partners who have made the larger investments. This problem, however, will be treated more fully in a later chapter where the methods of booking the interest, its treatment in case of a loss instead of a profit, and the computation of interest on drawings as well as on investments will be discussed and illustrated. Suffice it to say here that disputes frequently occur in connection with these problems and that detailed provision as to their handling should be made in the partnership agreement.

=Valuation and Correct Booking of Original Investments.=—A third matter of importance is the valuation and correct booking of the original investments other than cash. In the case of the sole proprietor this is of comparatively little importance because he will always reap the entire gain and therefore suffer no harm ultimately from present undervaluation of his property investments. In the partnership, however, where separate investment and personal accounts must be kept with each member, the correct valuation of the assets is of importance, inasmuch as the property of the partnership is the joint property of all partners and all will share ultimately in the effect of any under-or over-valuation at the time of investment. The partners' accounts are set up for the purpose of showing their respective interests in the enterprise, and after investments are once brought onto the books these accounts govern the equities of the various partners.

=Distinction between Buying Out an Interest and Making an Investment to Secure an Interest.=—The taking in of a partner by a sole proprietor or his admission as a new member to an existing partnership raises a point about which there must be a very definite understanding. A distinction must be made between purchasing from the owners an interest in the business as it stands at any given time and making an investment in a business to secure such an interest. The first transaction is of a personal nature between the owners and a third party who is a purchaser; in the other transaction the third party, who is an investor, puts in money to acquire an interest and his investment becomes the common property of all the owners of whom he is now one. In the one case the capital of the business is not increased, in the other case it is increased by the amount of the new investment. For example, if a balance sheet shows:

Cash $ 5,000.00 Liabilities $ 6,000.00 Other Assets 15,000.00 A. Jackson, Capital 14,000.00

and Jackson sells a half-interest to B. Killian for a given consideration, the new balance sheet becomes:

Cash $ 5,000.00 Liabilities $ 6,000.00 Other Assets 15,000.00 A. Jackson, Capital 7,000.00 B. Killian, Capital 7,000.00

In this case no new capital has come into the business because the purchase price does not go to the business as such but to A. Jackson as a private individual.

If, however, Killian is admitted as a half-interest partner by making a cash investment equal to the amount of Jackson's interest on the basis of book values, the balance sheet of Jackson and Killian will read:

Cash $19,000.00 Liabilities $ 6,000.00 Other Assets 15,000.00 A. Jackson, Capital 14,000.00 B. Killian, Capital 14,000.00

showing an investment of double the capital in the original Jackson business.

The question of good-will which frequently comes up when an interest in a going business is secured will be treated in Chapter XXXV, where also the manner of closing the books of the old business and opening those of the new firm will be shown.

=Final Considerations.=—From the foregoing discussion it is evident that the partnership relation gives rise to some of the most vexing questions which confront the accountant and the lawyer. It is a truism, therefore, that in drawing up the partnership agreement, all eventualities should be foreseen as nearly as possible and that they should be carefully provided for. As a final safeguard it is well to provide for the submission to arbitrators of disputes subsequently arising, the decision to be binding upon all the partners. This will avoid endless, expensive, and usually unsatisfactory actions at law and will more nearly secure justice to all. As a step in the same direction, it is suggested that provision be made for the drawing up of correct balance sheets and profit and loss statements, that sufficient time be allowed each partner to examine them as to their correctness and, if satisfied, that each be compelled to subscribe to them. This will localize any dissatisfaction within a limited time period and secure its adjustment while all salient points are still fresh in the minds of the interested parties.

CHAPTER XXXIV

CAPITALIZATION OF THE PARTNERSHIP

=Sources of Capital.=—From an accounting viewpoint, the capital of any business enterprise is the excess of its assets over its liabilities. Usually, the main fund of capital is secured by original contribution. In a partnership, the partners' investments provide the common partnership fund. Thereafter, additions to the capital may be secured in several ways:

1. Profits may be left in the business instead of being withdrawn.

2. Specific contributions may be made by the partners, which are either to be considered as additions to their capital investment, or are to be treated as more or less temporary loans to the business.

3. A new partner may be taken in, his contribution increasing the partnership capital.

The present chapter deals with original investments and with the first two types of additional capital mentioned above, while the next chapter discusses the admission of new members and the consolidation of partnerships.

=Original Contributions.=—It sometimes happens that the partnership agreement does not state specifically how much each partner shall invest in the business. For example, the agreement may state that partner A is to contribute certain properties, i.e., place of business and equipment; that B is to contribute a stock of goods, and that the investments of the remaining partners are to consist of cash, the exact amount of which is not stated because it depends upon the valuation to be placed upon the property and merchandise invested by A and B.

After such a valuation has been made and the amounts of the cash contributions have been determined, it may be found that the total investment is more than the business requires; or it may develop that some of the partners do not have sufficient funds available to pay their shares, while others may be able to contribute more than their respective shares. It thus happens that the partnership agreement is not always rigidly enforced, some partners contributing more, and others less, than the agreed amounts. At the time this is looked upon as a temporary arrangement, but it often results in a permanent condition. The partnership agreement should contain provision for such a contingency. If it does not, a later agreement should be made to regulate the relations between the partners.

=Adjustment of Capital Contributions.=—Whenever a partner contributes more than his agreed share, it is customary to allow him interest on the excess amount, and other partners whose investment may be less than the agreed amount are usually charged with

interest. This is obviously an equitable method of meeting the situation.

As a rule, these interest adjustments are handled through the Profit and Loss account, i.e., the partners who invest less than the agreed share are considered to owe interest to the partnership, and those who invest more have an interest claim against the business—not against the other partners individually. The debit or credit balance in the Profit and Loss account resulting from these adjustments is in turn distributed among _all_ the partners in the profit-or-loss-sharing ratios. It should be clearly understood, however, that although these adjustments are made through the Profit and Loss account, there is no element of business profit or expense involved. For this reason, these interest entries should be made direct in the appropriation section of the Profit and Loss, and should never be booked in the regular Interest accounts.

The following illustrations will bring out the different methods of adjustment:

PROBLEM. A, B, and C are equal partners under an agreement to contribute each $15,000. Provision is made that excess contributions are to be credited with interest at 6% and that deficits are to be charged at the same rate. The records show that actual contributions were: A, $18,000; B, $13,000; and C, $11,000.

Three methods of adjustment will be shown.

FIRST METHOD A’s excess is $3,000, interest on which is $180. B’s deficit is $2,000, interest on which is $120. C’s deficit is $4,000, interest on which is $240.

These three interest amounts are brought upon the books by the following journal entries:

Profit and Loss 180.00 A 180.00 B 120.00 C 240.00 Profit and Loss 360.00

The Profit and Loss account then shows a credit balance of $180, which is distributed as follows:

Profit and Loss 180.00 A 60.00 B 60.00 C 60.00

The net effect of these adjustments is a credit to A of $240, and debits to B and C of $60 and $180 respectively.

Note that A is credited with $180 for his excess of $3,000, and Profit and Loss is debited with the same amount, because it is the business that owes him this interest. If this Profit and Loss debit is distributed separately, A’s share of it is $60, so that his real credit on his $3,000 excess is not $180 but $120. On the other hand, the combined debits to B and C result in a credit to Profit and Loss of $360, and if this item is distributed as such, A’s share of it is $120, thus making his total credit on the complete adjustment $240. A similar explanation applies to the adjustments for B and C.

SECOND METHOD. The first method was based on a consideration of the respective excesses or deficits on capital investments, but the same result may be obtained by comparing all contributions with the amount of the smallest investment, viz., $11,000 by C. This would show A’s excess over C as $7,000, and B’s excess over C as $2,000, and these two amounts may be treated as loans to the business. The result is that A is credited with 6% on $7,000, and B with 6% on $2,000, as follows:

Profit and Loss 540.00 A 420.00 B 120.00

The debit to Profit and Loss is charged in equal shares to the three partners as follows:

A 180.00 B 180.00 C 180.00 Profit and Loss 540.00

The final result shows a net credit to A of $240, a net debit of $60 to B, and a net debit of $180 to C, the same as by the first method.

THIRD METHOD. The total capital contributed is $42,000. To be equal partners under the agreement, each should have contributed one-third of the common fund, or $14,000. Actually, A’s investment is $4,000 in excess of this, while B’s is $1,000 less, and C’s $3,000 less. The excess contribution of A, $4,000, may be looked upon as a loan to B and C as individuals, bringing their shares up to the $14,000; viz., $1,000 to B and $3,000 to C. Instead of making the adjustment through the Profit and Loss account as in the first two methods, the interest is now adjusted between the three partners as private persons, the entries affecting only the partners’ personal accounts. This adjustment results in a credit to A and a debit to B for $60, A having loaned B $1,000; and in a credit to A and a debit to C for $180, A having loaned C $3,000. A’s total credit is $240, and B’s and C’s debits are respectively $60 and $180, the same as by the other two methods.

Thus it is seen that any of the three methods employed leads to the same results. It will be observed, however, that in the example given the contemplated investments are to be equal for the three partners ($15,000), and the profit and loss is to be shared on the same basis. The three different methods of adjusting interest lead to the same result only when the profit-sharing ratio is identical with the ratio between the contemplated investments.

=Averaging Investments.=—In temporary partnerships, organized for carrying out a particular undertaking, the amount of capital needed is often not known and may vary at different stages of the undertaking. Here the partners usually contribute as need arises, and withdraw when funds not needed in the business become free. Under such conditions, the partnership agreement should always state the manner in which the partners' interests are to be adjusted. A common method, as explained and illustrated in Chapter XXXIII, is to compute the average investment of each partner and to use these amounts as the basis for profit-sharing. In this way the problem of interest adjustment as such is completely eliminated.

=Accretions of Capital through Profits.=—At the close of the fiscal period, when results are summarized, the net profits are transferred to the partners' accounts. As the amount of profit left in the business usually differs for different partners, it is evident that the partners' capital accounts at the end of the period will show a different ratio from that existing at the beginning. Assume that a given partnership consists of two members, A investing $2,000 and B $1,000, and that profits are to be shared in the same ratio as these original investments, i.e., 2:1; assume further that A withdraws the greater part of his profits while B allows his share to accumulate, and that at the end of a number of years the capital ratios have completely changed, the capitals being, say, $8,000 for A and $24,000 for B. Obviously, under such circumstances it would not be just for A still to receive twice as much profit as B on the basis of the _original_ investment ratio of 2:1.

Whenever it is intended that profits are to be shared on the basis of investments, the profit-sharing ratio should be changed from time to time in order to correspond with actual investments, and this should be plainly stated in the partnership agreement; or increments to capital through the accretion of profits should be treated as temporary loans subject to withdrawals and bearing interest until withdrawn. It should be the policy of the firm to offer an incentive to its members to leave their surplus profits in the business and so prevent the need of borrowing from outside.

Finally, it may be said that in the event of dissolution, accretions through profits constitute claims against the firm ranking before the partners' capitals. Such accretions partake of the nature of loans and for this reason they are sometimes carried in _partners' loan accounts_, to keep them separate from the original capital investments, or are left in the "Personal" accounts which are not then closed into the "Capital" accounts.

=Additional Contributions and Loans.=—When contributions are made by partners there should be a specific understanding as to whether such funds are to be considered as additional capital or as loans to the partnership. In the first case the items should be shown in the capital accounts of the partners, thus requiring a reconsideration of the profit-sharing ratio—although a change is not always made; in the second case they should be entered in the partner's loan accounts with corresponding interest adjustments, as has been explained.

Loans by partners may be evidenced by firm notes signed by all the partners. However, these notes should not be carried in the regular Notes Payable account because that account represents the firm's liability to outsiders, which must ordinarily be met promptly according to the terms of the instrument. At common law a partner may not bring suit against the firm of which he is a member; hence there is an essential difference between these two kinds of notes. For this reason a new account is opened entitled "Partners' Notes Payable," which is credited whenever the firm issues a promissory note to any of its members. Where the loan is not evidenced by a formal note, record should be in the partner's loan account. As stated on page 324, any loans made by partners to the business rank before regular capital claims, and this priority is not changed when such loans are evidenced by promissory notes.

=Partners' Loans in Relation to Firm Credit.=—Loans made by partners to the business may be viewed in two very different ways, depending upon the credit rating of the firm. If there is distrust as to the partners' standing and financial condition, the fact that they themselves, who know the real condition better than any outsider, are willing to put additional capital into the business, is the best evidence that the firm is not so badly off. Consequently, loans made by partners under such conditions help to increase the firm's credit.

On the other hand, if the integrity of any member of the firm is questionable, his loans to the business do not necessarily increase the credit of the firm; for in case of financial trouble he may attempt secretly to withdraw part of the assets from the business and to

conceal the true condition of affairs from the creditors. Being on the inside, he is in a position to do this before outsiders can even scent trouble. Normally, however, the loan of a partner makes a better impression than a loan from an outsider, since in case of insolvency and dissolution the partner's loan ranks _after_ the claims of outside creditors.

It sometimes happens that in a partnership one or more of its members lends the firm comparatively large amounts of money and accepts demand notes as evidence of such loans. If the partner holding such a note is unscrupulous, he may present it for payment at an unfavorable time and, if the business is unable to pay, may demand an "accounting." He may even go so far as to cause its dissolution, repurchase the business at much less than its true value and so "freeze out" his partners.

=Borrowed Capital.=—It may happen that a firm is obliged to borrow funds from outside in order to increase its working capital. For instance, the partners may have no available private funds for further investment and yet may not desire to admit new capital on a profit-and-loss-sharing basis. Such loans usually are on a long-time basis, and should not be included in the Notes Payable account. A special account should be opened, e.g., Notes Payable Special, Mortgage, or some other title plainly indicating the nature of the loan. Sharp distinction should be made between funds borrowed for the purpose of increasing the permanent capital, and money borrowed for current needs. The need for additional current funds usually results from seasonal fluctuations in business, slow collection of customers' accounts, or slow movement of stock, and is met by current borrowing at a bank; while the need for increased capital is caused by the original capital investment being insufficient to meet present conditions.

CHAPTER XXXV

OTHER PARTNERSHIP PROBLEMS

=Admission of a New Partner.=—In Chapter XXXIII a distinction was made between buying out an interest in a business and making an investment in a business. In the former case no new capital is acquired, while in the latter the capital of the firm is increased by the amount of the new partner's contribution.

When a new partner is admitted he usually acquires not merely the right to share in the profits, but he also obtains a share in the net worth (often called "net assets") of the enterprise. For this reason it is necessary that all the partners, including the new member, agree on the value of the net assets, and in this connection any of the following possibilities may arise:

1. Upon admission of the new partner the book accounts may be considered to represent the true status of the business. A balance sheet is drawn up and the new partner is admitted on the basis of the net worth it shows.

2. It may be agreed that the assets are not worth the amount at which they are carried on the books and that a new valuation be placed upon them.

3. The business may be considered to be worth more than the amount shown by the balance sheet.

=First Case.=—In the first case little difficulty is met in making the opening entry admitting the new partner. For instance, if the balance sheet shows a net worth of $30,000, and the new partner wishes to make an investment in order to secure a one-fourth interest in the firm, the amount to be contributed is manifestly $10,000. Assuming that he makes a cash investment of $10,000, the following entry meets all accounting requirements:

Cash 10,000.00 A, Capital 10,000.00

As a result of this cash investment of $10,000, the net worth of the new firm is increased to $40,000 and the one-fourth interest belonging to A is evidenced by his capital account at $10,000. The new firm may now continue the old records and no further adjustments need be made.

=Second Case.=—In the second case it is necessary to place a new valuation upon the assets of the old firm and the accounts of the old partners must be adjusted accordingly. For instance, suppose A and B are equal partners and the financial status of the firm is shown by the following balance sheet:

BALANCE SHEET OF A & B

Cash $ 1,000.00 Notes Payable $ 3,000.00 Accounts Receivable 10,000.00 Accounts Payable 5,000.00 Merchandise 6,000.00 Mortgage on Bldg 4,000.00 Building and Equipment 16,000.00 A, Capital 10,500.00 B, Capital 10,500.00 ---------- ----------

$33,000.00 $33,000.00 ========== ==========

More capital is needed and C is invited to make an investment. Upon investigation he finds that there are included under Accounts Receivable many old items, of which it is estimated $1,000 will be uncollectible; that the merchandise is overvalued to the amount of $500; and that the building and equipment are worth $1,500 less than is shown on the books. He offers to make an investment to secure a one-fourth interest and his offer is accepted.

As a result of the new valuations placed upon the assets, the net worth of the firm is now $18,000, against the old showing of $21,000. Consequently, the capital accounts of A and B are reduced from $10,500 to $9,000 each. The new partner is to invest a certain sum sufficient to acquire a one-fourth interest in the new business. Hence the combined capital of A and B, amounting to $18,000, will represent three-fourths of the new capital, and consequently the amount to be invested by C is $6,000. Thus the new capital of the firm will amount to $24,000, one-fourth of which, or $6,000, is credited to C's capital account.

The balance sheet of the new firm will show:

BALANCE SHEET OF A, B & C

Cash $ 7,000.00 Notes Payable $ 3,000.00 Accounts Rec. $10,000 Accounts Payable 5,000.00 Less—Reserve 1,000 9,000.00 Mortgage on Bldg 4,000.00 ------- A, Capital 9,000.00 Merchandise 5,500.00 B, Capital 9,000.00 Building and Equipment 14,500.00 C, Capital 6,000.00 ---------- ---------- $36,000.00 $36,000.00 ========== ==========

The firm has thus secured $6,000 additional capital, on a basis somewhat unfavorable for the present, but inasmuch as the books now show conservative values, no real injustice results.

=Third Case.=—The third case shows the firm in a position to demand something more than book values as the basis for admission of the new partner. The presumption is that the old firm is favorably known, has an established trade and patronage, built by fair dealing and judicious advertising, by its favorable location, and the numerous other ways in which a substantial business may be developed. Its standing in the community is a factor of value to the firm because it brings trade to its doors. Other conditions being equal, a firm which enjoys a good reputation is worth more than a new venture. Such a reputation is known as "good-will" and constitutes an exceedingly valuable though an intangible asset. The essence of good-will is the ability to produce more than normal profits, i.e., profits above the average in that line. Consequently, whenever the members of a firm consider the admission of a new partner, good-will is regarded as one of the _assets_ of the existing enterprise, thereby increasing its net worth.

The valuation of good-will, however, is a difficult matter and it is a well-established principle that good accounting will not allow the asset good-will to be set up on the books of a concern unless it has come into possession of it by purchase or unless a part of its own good-will is sold to a new partner. In this case the price received for the portion sold represents an outsider's valuation and may therefore become the basis for valuing the whole of it.

The following case will serve as an illustration:

PROBLEM. Assume that X has a one-half interest in a firm, and Y and Z a one-fourth interest each, the balance sheet showing the following summarized facts:

BALANCE SHEET OF X, Y & Z

Cash $ 2,000.00 Liabilities $10,000.00 Other Assets 48,000.00 X, Capital 20,000.00 Y, Capital 10,000.00 Z, Capital 10,000.00 ---------- ---------- $50,000.00 $50,000.00 ========== ==========

An outsider, R, is now to be admitted to a one-fifth interest by making an investment in the business. The relative shares of the others are to remain as before. Hence, after R's admission, X will have two-fifths, and Y, Z, and R one-fifth interest each. It is further assumed that no revaluation of the tangible assets is necessary.

The net worth of the old firm, according to the books, is $40,000, and if this were taken as the basis for admitting R, an investment of $10,000 would be sufficient to acquire a one-fifth interest in the new firm. However the business is considered to be worth $10,000 more than the $40,000 shown in the balance sheet, and for this reason, instead of paying $10,000, R is required to invest $12,500. The excess of $2,500 is paid by R as an offset to the shares of the others in the good-will of the firm.

There are three ways of treating this good-will element, viz.:

FIRST METHOD. Debit the Good-Will account for the amount actually paid for it by R, viz., $2,500, and credit the capital accounts of the old partners in proportion to their shares in the profits:

Good-Will 2,500.00 X, Capital 1,250.00 Y, Capital 625.00 Z, Capital 625.00

As a result of this entry, the capital account of X is $21,250, and those of Y and Z $10,625 each. The capital account of R, however, shows a credit of $12,500. In other words, R's interest in the net assets—although not in the profits—of the business as shown by his account is _larger_ than that of Y and Z, while as a matter of fact he is to have an equal share. For this reason, this method of treating good-will is not satisfactory.

SECOND METHOD. This method regards the matter from a different standpoint. Taking book values as a basis, the share bought by R is worth only $10,000. However, on account of good-will, the real value of this share is considered to be higher and R is required to pay $12,500 for it. Hence, in order that the books may show actual values, the good-will item must be added to the assets of the old firm, at the same time increasing the capital accounts of X, Y, and Z in proportion to their shares in the profits. The entry is:

Good-Will 10,000.00 X, Capital 5,000.00 Y, Capital 2,500.00 Z, Capital 2,500.00

As a result of this adjustment the capital of the old firm is shown as $50,000. R now invests $12,500, and the capital is thereby increased to $62,500. The capital accounts of the four partners now show $25,000, or two-fifths for X, and $12,500 or one-fifth each for Y, Z, and R.

THIRD METHOD. Under this method of handling good-will, the extra $2,500 invested by R is treated as a bonus for distribution among the members of the old firm, their capital interests in the new firm remaining the same as in the old and R's appearing at $10,000. There is no objection to this method if R is satisfied.

Of the three methods, the second usually proves the most satisfactory.

A similar problem involving the handling of good-will is encountered when a member of an existing firm sells out his interest, including a share of the good-will, to one who takes his place in the firm. Here the transaction may be looked upon as a private deal between buyer and seller, in which case the buyer merely succeeds to the seller's interest in the firm, his capital appearing on the books at the same amount as the seller's former capital figure even though the new partner pays more for it; or the good-will may be brought onto the books and the capitals of all the partners be shown at increased figures, as under the second method discussed above.

=Consolidation of Partnerships.=—There are various reasons why the consolidation of partnerships may be of mutual advantage to the individual firms concerned. When two or more firms consolidate, the competition which formerly existed between them is eliminated and co-operation takes its place. Also by uniting their businesses, many of the operations which were formerly performed separately are now amalgamated with resulting savings. Many other advantages may result from such consolidations.

From the standpoint of the accountant, the consolidation of partnerships is essentially the same as the admission of new partners, the same principles applying to both. Before actual consolidation takes place, it is necessary for each of the partnerships to place a new valuation upon its assets and for all concerned to agree upon the new figures. In almost all cases good-will is an important factor. The valuation of good-will requires an investigation of the profits and profit-earning capacity of the member firms. Conditions affecting the profits of the various firms must be equalized as nearly as possible so that the earning capacity of each can be compared on an equitable basis. Such questions as the way in which partners' salaries, interest on capitals, withdrawals, and loans have been handled; the relation of outside sources of income, if any, to the profit of any of the member firms; and whether the consolidation contemplates taking over such source of profits—these and similar questions must be considered and treated equitably for all concerned.

The following illustration is given to indicate the bookkeeping problems incident to consolidations:

PROBLEM. A and B, equal partners in an established business, consolidate with C and D, equal owners of an allied business. A and B are each to have a one-third, and C and D each a one-sixth interest in the new firm. The following balance sheets show their financial positions:

BALANCE SHEET OF A & B Cash $ 2,500.00 Notes Payable $ 5,000.00 Notes Receivable 1,000.00 Accounts Payable 8,000.00 Accounts Receivable 22,000.00 Mortgage on Real Merchandise 10,000.00 Estate 4,000.00 Furniture and Fixtures 2,500.00 A, Capital 16,000.00 Delivery Equipment 1,500.00 B, Capital 16,000.00 Real Estate 9,500.00 ---------- ---------- $49,000.00 $49,000.00 ========== ==========

BALANCE SHEET OF C & D Cash $ 5,000.00 Notes Payable $ 5,000.00 Accounts Receivable 15,000.00 Accounts Payable 7,750.00 Merchandise 8,000.00 C, Capital 9,000.00 Furniture & Fixtures 2,000.00 D, Capital 9,000.00 Horse & Wagon 750.00 ---------- ---------- $30,750.00 $30,750.00 ========== ==========

A careful valuation of the various properties shows the figures of the balance sheet of C & D to be conservatively estimated. In regard to A & B's figures, however, it is decided to allow $2,000 for possible bad debts, and to value their merchandise at $9,000, delivery equipment at $1,000, and real estate at $9,000. Furthermore, it is agreed that C & D's good-will is to be valued at $5,000, and A & B's at $10,000.

After the adjustments the new balance sheets appear as follows:

BALANCE SHEET OF A & B Cash $2,500.00 Notes Payable $5,000.00 Notes Receivable 1,000.00 Accounts Payable 8,000.00 Accounts " $22,000 Mortgage on Real _Less_—Reserve 2,000 20,000.00 Estate 4,000.00 Merchandise 9,000.00 A, Capital 19,000.00 Furniture and Fixtures 2,500.00 B, Capital 19,000.00 Delivery Equipment 1,000.00 Real Estate 9,000.00 Good-Will 10,000.00 $55,000.00 $55,000.00 ========== ==========

BALANCE SHEET OF C & D Cash $ 5,000.00 Notes Payable $ 5,000.00 Accounts Receivable 15,000.00 Accounts Payable 7,750.00 Merchandise 8,000.00 C, Capital 11,500.00 Furniture and Fixtures 2,000.00 D, Capital 11,500.00 Horse and Wagon 750.00 Good-Will 5,000.00 ---------- ---------- $35,750.00 $35,750.00 ========== ==========

It is agreed that C and D's capitals are each to be taken as representing one-sixth of the capitalization of the new firm, and A and B are each to contribute $4,000 in cash to bring their capitals up to the required amounts.

The opening balance sheet of the consolidated firm will then read as follows:

BALANCE SHEET OF A, B, C & D Cash $15,500.00 Notes Payable $10,000.00 Notes Receivable 1,000.00 Accounts Payable 15,750.00 Accounts Mortgage on Real Receivable $37,000 Estate 4,000.00 _Less_—Reserve 2,000 35,000.00 A, Capital 23,000.00 Merchandise ------- 17,000.00 B, Capital 23,000.00 Furniture and Fixtures 4,500.00 C, Capital 11,500.00 Delivery Equipment 1,750.00 D, Capital 11,500.00 Real Estate 9,000.00 Good-Will 15,000.00 ---------- ---------- $98,750.00 $98,750.00 ========== ==========

CHAPTER XXXVI

PARTNERSHIP PROFITS

=Ambiguity of Definition of Profits.=—The term "profits" as applied to business is perhaps used with as little uniformity as any term met with. When a concern speaks of its profits, it is difficult to know exactly what is intended, because the meaning of the term depends very largely on the methods of accounting of that particular concern. The reported profits of different firms are not, therefore, a true basis for judging their relative worths. For instance, although the net profits of a single proprietorship and of a partnership are usually determined in the same manner, there is nevertheless variation in the treatment of some items such as salaries, drawings, interest on capital invested, etc. The partnership form, like the single proprietorship, contemplates an investment on the part of the owners not only of capital but also of time and effort. This is one of the differences in working organization between these forms of business and the corporation. Investment in the corporation is of capital only. If services are employed by the corporation, they are paid for and charged as services, salaries, etc.

=Compensation for Time and Services.=—In the partnership form of organization, the active and direct management of the business is usually vested in the owners. Where this is not the situation, as in a limited partnership, or whenever one or more of the partners does not take an active part in the management of the business, his share of the profit is usually curtailed by the allowance of salaries to the managing partners before any distribution of profits in the agreed ratio is made to the partners. Thus, partnership profits include not only the salaries of the owners but, in general, a recompense for the time and ability of the proprietors. The man who makes an investment in a partnership does so usually because he desires to invest his time as well as his capital. He expects,

therefore, to receive not only a fair rate of interest on his money but also pay for the services he renders.

=Interest on Investment.=—The rate paid for the use of money is dependent both on the money market and on the element of risk involved in the particular investment. In mining ventures, for instance, where there is frequently considerable uncertainty as to the return of the principal, the interest rate is sufficiently high to offset, during the life of the loan, the possible loss of the principal at the end. So an investor in a partnership, because of the greater element of risk in comparison with other and safer investments, requires a higher rate of return in interest than he would ordinarily secure through the investment of his capital in sound securities.

=Partnership Profits Defined.=—Partnership profits, therefore, contain these two elements—interest and recompense for services. If profits are extraordinary or above normal, such excess may be and usually is the measure of the more-than-average ability of the partners, unless it results from the monopolistic character of the business.

In speaking of profits the term is used in a technical accounting sense and has reference to the manner of their showing in the Profit and Loss account and its content. That account or the Profit and Loss statement usually develops a so-called “net profit” which is distributed to the partners. Such profits are more easily defined by stating what should not be considered in their determination, than by attempting to give an itemized list of the income and expense items entering therein.

In accordance with the theory of the law of partnership, the net profit of a partnership is the balance of the Profit and Loss account before interest on owners’ capital investments and the recompense to the partners on account of time and services are taken into account. In the accounting for an ordinary partnership, such items as interest on capital investments, salaries to partners, etc., are not to be considered as expense items to be deducted from profits before the net earnings are determined, but as a part of the net profits to be distributed to the several owners of the business. The payment of salaries and interest on capital is made simply for the purpose of distributing net profits according to certain methods agreed upon by the members of the firm.

=Profit and Loss for Comparative Purposes.=—For the purpose of comparing results between different periods, the Profit and Loss account should have a fairly uniform content from year to year. It should set forth the amount of the net operating profit, in the calculation of which account should be taken of all ordinary income and expenses incurred in the operation of the business. This will provide the basis for comparison, as between periods, of the ordinary normal activities of the business.

In the “Non-Operating” or “Other Income” sections any “outside-the-business” income and expense should be shown, such as income from outside investments, and expenses in connection therewith. Items of extraordinary income and expense, however, such as the profits arising through the sale of good-will, the sale of real estate, extraordinary losses from fire, etc., usually are taken directly into the partners’ accounts so as not to destroy the value (for purposes of comparison) of the results shown by the Profit and Loss account from year to year.

In this way, while the purpose of the Profit and Loss account is to summarize the temporary proprietorship accounts, some proprietorship items may be omitted for the sake of making the summary of greater value to the proprietors. Such a method of handling does not conflict with principles previously laid down, but rests upon the general principle that accounting methods and forms must be flexible in order to conform to the requirements of particular cases; else they fail in fulfilling their full purpose.

=Allowance of Salaries.=—The allowance of salaries to partners is not so much for the purpose of measuring the excess of the profits of the partnership over what the individual owners might have earned by working for others, as it is for the purpose of equalizing or adjusting their interests on an equitable basis. When, on the one hand, men invest their abilities and services in addition to their capitals, and on the other hand, the profit and loss-sharing ratio is determined on the basis of capitals invested, the greater ability of a given partner may be recognized and compensated by a salary. Thus a partner of exceptional ability secures a larger share in the profits by receiving a fixed amount under the head of salary, the remaining part of the net profits being divided among all the partners in the profit and loss-sharing ratio.

=Allowance of Interest.=—As explained in Chapter XXXIII, it is not unusual in partnerships where the profit and loss ratio differs from the capital ratio, to allow interest on capital. The effect of such a provision is to secure a distribution of profits on a dual basis, viz., a part as interest on the capitals in the capital ratio and the remainder in the profit and loss ratio. Thus, two partners, A and B, whose capitals are $10,000 and $15,000 respectively, with a 6% interest allowance on capital and a subsequent half-and-half distribution of profits, share the profits in effect on two different bases. Suppose the profits are $6,000. The interest requirement will give A $600 and B $900, after which $4,500 will be divided equally. Interest on partners’ capitals is thus in no sense an operating expense and should be handled always in the appropriation section of the Profit and Loss.

If the partnership agreement makes specific provision (but not otherwise), interest may be charged on partners' drawings. This is merely an additional device for adjusting the partners' interests, and causes a slight difference in the net shares of profits. Where interest is allowed on capitals and also charged on drawings, the partners' accounts, Personal and Capital, when considered together, comprise virtually an account current, and the interest computations may be made as will be explained in Chapter L in connection with accounts current.

Another method of profit-sharing sometimes introduced in the partnership agreement is the device of an interest allowance for a contribution in excess of the agreed amount and an interest charge on partners' deficiency of capital. This method of equalizing unequal investments, as illustrated in Chapter XXXIV, is a fair arrangement to all concerned.

=Interest on Partners' Loans.=—Careful differentiation must be made between interest on partners' capitals and on partners' loans. If a loan is secured from outside parties, its interest cost is a business expense, to be taken into account before determining net profits. A loan from a partner does not in the least change the manner of showing its cost. Interest on partners' loans is not, therefore, to be handled in the appropriation section of the Profit and Loss account, but should be charged to the regular Interest Cost account, which is cleared in the regular way through Profit and Loss. The credit is to Cash if actually paid, or to the partners' personal accounts if unpaid, although the amount is sometimes credited to the partners' loan accounts in order to secure a compounding of the interest.

=Reserved Profits.=—In rare cases, before the partners' shares in the net profit are determined, a portion of it may be reserved for some specific purpose. The portion so reserved is transferred from Profit and Loss to some specified reserve account, to indicate the retention of the profits in the business. If the profits were transferred to the partners' accounts, they would be subject to withdrawal from the business. Even when shown in the reserve account, however, they belong to the proprietors and are just as much a part of the net worth of the business as if credited to the proprietors' accounts. Such reservation of profits may be for the purpose of providing for the replacement of some fixed asset when it wears out, as buildings, machinery, etc., or for meeting a liability when it comes due, or for some similar purposes. Such reservations, however, are seldom made in partnership accounting and a complete treatment of the subject is reserved for the work of the second year in connection with corporation accounting.

It should be noted that reserves created from profits are not to be confused with valuation accounts, such as reserves for depreciation and doubtful accounts. Valuation accounts in no sense represent a reservation of net profits. They represent the credit side of certain asset accounts. The contra debits—to depreciation or bad debts—of these credit reserves are expenses of the business which must be taken into account before the amount of net profit can be determined.

=Closing Profits to Partners' Accounts.=—The disposition of profits under a partnership does not differ materially from that under the single proprietorship form. When the net profits are determined, they belong to the proprietors and are usually transferred to their accounts. The method of transfer may be either by way of the partners' personal accounts or direct to the capital accounts. The principle involved in either treatment was discussed at the time of closing the books for the single proprietorship and will not be repeated here. Where the partners do not desire to have any change shown in their original capital accounts, the profits may be transferred to the loan accounts of the partners or stand as open balances in their personal accounts.

=The Appropriation Section—Distributing a Deficit.=—The appropriation section of the Profit and Loss account shows the distribution of net profits to the partners' accounts. A thorough understanding of the partnership agreement is necessary before the proper distribution can be made. If the agreement provides for salaries and interest on capitals and drawings, these requirements must first be met, even though the net profits are insufficient to satisfy them. Their purpose, as explained above, is to equalize conditions and interests among the partners preliminary to their sharing in the profit and loss ratio. If this equalization results in a deficit, such deficit will be distributed in the agreed ratio and to that extent nullify some portion of the profits distributed as salaries and interest. If specific provision in the articles of copartnership requires a different handling of the salaries and interest items, that provision of course governs. Otherwise these items should be treated as above.

If any of the partners leave profits in the business, this usually results in a changing ratio of the capital account balances. Where the distribution of profits is based upon the original contributions, it is advisable to transfer the profits left in the business to separate loan accounts for the partners. The partners' capital accounts then always show their original contributions.

=Partners' Withdrawals.=—Partners' withdrawals and salaries are usually handled in a very unsystematic way. The amount of the drawings allowed each partner during a given period—week or month—should be definitely determined by agreement, and regular checks should be issued for these amounts. The payment of partners' personal bills and the handling of any other personal items

should, as a matter of standard practice, be made out of personal funds.

If the partnership agreement provides for salaries these should be credited, when due, to the partners' drawing accounts which will then be charged with all actual drawings, whether for salary or otherwise. The offsetting charge at the time the salary credit is made should be to a "Partners' Salaries" account, which at the close of the fiscal period is closed into the appropriation section of the Profit and Loss account, thereby showing in it the proper distribution of profits as salary.

=Profits Determination upon Admitting a New Partner.=—Particular care should be taken to determine as nearly as possible the correct net profit at the time of any change in the partners' relations. Upon the admission of a new partner, failure to make entry in the old partners' accounts of any profit rightfully belonging to them leads to its being shared with the new partner and consequently results in a loss to the old partners. In like manner the deferring of an expense charge—rightfully belonging to the period before the admission of the new partner—to the period after the admission, results in a wrongful charge to the new partner. Similarly, when a partner is admitted on a changing profit ratio basis (as when, for example, he is to receive a one-fourth share for three years, at the end of which time he is to have a one-third share), an incorrect determination of profits at the end of the three-year period may mean a loss either to him or to the old partners. So long as the same partnership and the same profit and loss-sharing ratios continue, no injustice results through failure to include some such items in their proper periods, as they are cumulative and their effect will be recorded in later periods. However, this is no excuse for the inaccurate determination of profits at any time.

CHAPTER XXXVII

PARTNERSHIP DISSOLUTION

=Temporary Nature of Partnership.=—Because of its personal character, a partnership has necessarily a limited duration. It must look forward to the time when its business will have to be closed up. The chief causes leading to a dissolution are briefly reviewed here.

=Causes of Dissolution=

1. The withdrawal of any partner. Under ordinary circumstances a partner cannot be held to a specific performance of his contract. If he becomes dissatisfied, suspicious, or desires for other reasons to withdraw from his contract before its expiration, he has that power. Such withdrawal cannot be looked upon as a right but only as a power to be exercised under unusual circumstances. If his withdrawal before the agreement terminates results in damage to his copartners, they have a lawful claim against him for the amount of the damage. Under extraordinary conditions, specific performance of the contract might be decreed, i.e., the partner would not be allowed to withdraw.

Withdrawal does not relieve a partner from liability for partnership debts incurred while he was a member of the firm. Any creditors not paid by the firm may hold the withdrawing partner liable for the debts. To be relieved from the liability on debts arising _after_ his withdrawal, personal notice of withdrawal must be given to all the firms with which the partnership has been dealing; a published notice being considered sufficient for the parties not dealing with the firm until after withdrawal.

2. Sale of a partner's interest or admission of a new partner. When a partner, with the consent of his copartners, sells his interest in the firm to another, or when a new member is admitted to the partnership, in the eyes of the law the old partnership has ceased to exist and a new one has taken its place.

3. Limitations in the partnership agreement. The agreement may specify the period for which the partnership is to exist. If it is a special partnership, the object it is to accomplish may be stated and the law considers the firm automatically dissolved as soon as that object is attained.

4. Mutual consent of the partners. Whether or not the partnership period is limited by the agreement, the partners may at any time rescind their contract by mutual consent.

5. Misconduct, insanity, death, assignment, or bankruptcy of a partner. The happening of any of these contingencies effects a dissolution. By misconduct may be understood a member's failure to pay the agreed contribution of capital, failure to perform his duties, his acting in bad faith towards his copartners, etc.

6. Illegal object. A partnership entered into for the pursuit of an object which later becomes illegal is automatically dissolved.

7. War between nations of which partners are citizens. This dissolves the partnership, though such dissolution may be more in the nature of a suspension, inasmuch as the relation may be resumed upon cessation of hostilities.

8. Bankruptcy of the firm. This results in the firm's assets being sold to satisfy the claims of its creditors and the firm as such ceases to exist.

9. Sale or transfer. A firm may sell out to another firm or change its form of organization to that of a corporation. The old firm, therefore, no longer exists.

=Problems Incident to Dissolution.=—It is purposed to consider some of the problems involved in winding up the affairs of a partnership. From the schedule of causes of dissolution given above it will be seen that a firm may be either solvent or insolvent at dissolution. The three statements sometimes set up in the case of insolvency—the Statement of Affairs, the Deficiency Account, and the Realization and Liquidation Statement—will not be explained here but results obtained through them will be taken into account. These statements are seldom met in practice and are not standardized either as to form or content. Their treatment is deferred to the work of the second year.

=Partnership Provisions Covering Liquidation.=—Because of the certainty of final dissolution, it is not unusual for the partnership agreement to make definite regulations concerning the method of liquidation. The appointment of one of the members as liquidating partner, the manner of distributing the proceeds from liquidation whether by instalments or otherwise, the manner of paying the liquidator for his services—all these contingencies should be provided for.

Where dissolution is forced by the death of one of the partners, to determine the interest of his heirs it is necessary to take inventory and make appraisal of the firm's assets. To avoid this inconvenience to the business, provision is sometimes made in the agreement that the remaining partners shall continue the business until the end of the regular fiscal period. The deceased partner's share in the profits for the current period up to the date of his death is determined by prorating the year's profit over the period in which the deceased had an interest. The method of calculating the firm's good-will is usually provided for in the partnership agreement so that the estate of the deceased partner will share in it also. Usually interest is allowed the estate of the deceased partner from the date of his death until the settlement of his share.

=Partners' Rights and Procedure During Liquidation.=—When dissolution is accompanied by liquidation, as happens in many instances, all the partners have an equal right to share in the work of liquidation. Since the work usually does not require the time of all the partners, a customary procedure is to appoint one member—or an outsider—as the liquidator. Notice of the dissolution, in which the name of the liquidator is given, is published in the leading newspapers. If liquidation is necessary because of the death of a partner, great responsibility rests upon the liquidator. He must act in strict good faith and endeavor to realize the best price possible for the assets of the firm in the interest of the deceased partner's estate. A similar responsibility rests upon him when liquidation is carried on in the interest of absent members.

The expenses and losses incident to liquidation must be borne by all in the profit and loss ratio. The liquidator may be paid either by means of a commission on the sums realized or by a salary. If the liquidator is a partner, settlement may take place privately between the partners but usually his commission or salary is charged to the firm's liquidation expenses.

Liquidation may proceed by sale of the assets in regular order and may even permit the purchase of additional goods where necessary to fulfil existing contracts or to complete partly manufactured goods, or where stock on hand can be disposed of to better advantage by the addition of side lines or specialties.

=Distribution of Proceeds.=—Upon the realization of the assets, application of the proceeds must be made in the following order: First, the claims of outside creditors must be met in full or by compromise where not fully recognized. Second, the claims of the partners on account of loans or advances made to the firm must be satisfied. Third, the partners share in the remainder, by first taking out their respective capital contributions and then, if there is a balance, by sharing it in their profit and loss ratios. If there is a loss, this must be shared in the profit and loss ratio before withdrawal of any capital contributions. The remainder, if any, is divided among the partners in the ratio of their capitals as diminished by the loss. Whether the net assets are either more or less than the total amount of the capitals, the difference is shared in the profit and loss ratio, and what remains is shared in the capital ratio. If a careful accounting is made of the profit or loss at the time of the sale of each piece of property and these profits and losses together with the dissolution expenses are summarized and distributed to the partners' capital accounts, those accounts will of course show the claims of the various partners on the net assets of the business after all assets have been converted into cash and all liabilities

paid.

Instead of a complete liquidation of the firm's assets, certain of the assets may, by mutual consent, be taken over by each partner at agreed values and applied toward the satisfaction of his capital and loan interests. Such use of assets is spoken of as a _conversion_ to that particular purpose. It must be distinctly understood that this is not a right which any partner can demand, but only a privilege granted by the mutual agreement of the partners. Any partner can demand that all the assets be sold and that the proceeds be applied in satisfaction of the interests concerned.

=Sharing Losses.=—In the case of insolvency, the partners are compelled to share the losses in the profit and loss ratio, not in capital ratio, and these losses are chargeable against their capital accounts. If the capital account of any of the partners is not large enough to satisfy his share in the losses, a deficit in that partner's interest results, which is represented by the debit balance in his capital account. This shows the amount which he must contribute to the firm in order that all claims may be satisfied. The rule that profits and losses in liquidation cannot be shared in the same ratio as capitals, unless this ratio is also the profit and loss ratio, is responsible for the fact that upon dissolution one or more partners may have to make additional contributions, while others may not be obliged to do so. This duty of contributing to make up a deficit is inherent in the partnership relation and can be enforced by the copartners.

A few illustrations will set forth the main problems in connection with the liquidation of partners' capitals:

=1. Sharing Losses Equally=

BALANCE SHEET OF A, B & C Cash $10,000.00 Liabilities $10,000.00 Other Assets 60,000.00 A, Capital 15,000.00 B, Capital 20,000.00 C, Capital 25,000.00 ---------- ---------- $70,000.00 $70,000.00 ========== ==========

A, B, and C share profits and losses equally.

The above balance sheet shows, in summary form, the condition of the firm previous to liquidation, and also indicates the shares of the partners in the net assets as on that date, i.e., the partners share in the net assets in the ratio 15:20:25 or 3:4:5. Dissolution becomes necessary and in the course of liquidation the expenses and losses incurred amount to $15,000. After the net loss of $15,000 is divided equally among the partners, the capitals will amount to, A $10,000, B $15,000, and C $20,000. The result is that the capital ratio has changed from 3:4:5 to 10:15:20, or 2:3:4, and the net assets of $45,000 are to be shared in this new ratio.

=2. Capital Deficit=

BALANCE SHEET OF JONES & SMITH Cash $10,000.00 Jones, Capital $20,000.00 Losses in Liquidation 15,000.00 Smith, Capital 5,000.00 ---------- ---------- $25,000.00 $25,000.00 ========== ==========

Jones and Smith share profits and losses equally.

The above balance sheet shows the condition of the firm after liquidation. It is necessary, first, to distribute the liquidation losses among the partners, after which they share in the net assets according to capital ratios. Accordingly, each capital account is debited with an equal share in the loss of $15,000, after which Jones' capital is $12,500 and Smith's account shows a debit balance of $2,500. This means that Jones not only gets the entire cash of $10,000, but Smith must contribute $2,500 to the firm and this also goes to Jones.

=3. Personal Insolvency of One Partner=

BALANCE SHEET OF SMITH, JONES & GREEN Cash $16,000.00 Smith, Capital $15,000.00 Jones, Capital 9,000.00 Green, Capital 10,000.00 ---------- ---------- $25,000.00 $25,000.00 ========== ==========

Smith and Jones each have a ■ share and Green a ■ share in profits and losses.

The above balance sheet shows the financial condition of the firm after taking into consideration the losses incident to liquidation. From this it is seen that Jones owes the business $9,000. Assume that he is personally insolvent and cannot contribute the share due from him. The net assets available for distribution consist of $16,000 in cash. Inasmuch as Jones' interest is entirely wiped out and a contribution is due from him which he cannot pay, the amount of that contribution is an additional loss to be borne by the two remaining partners. Their respective shares in this loss are determined by their original profit and loss ratios ■ and ■, so that as between themselves Smith must bear ■ of the loss or $6,000, and Green ■ or $3,000; after which Smith's capital and share in the

net assets is $9,000, and Green's $7,000.

Where a partner, in his private capacity, and the firm of which he is a member are both bankrupt, his personal creditors have first claim on his personal estate and the firm's creditors on the assets of the firm.

=Distribution by Instalments.=—Where the liquidation is of long duration, the partners may desire to receive what is due them by instalments rather than wait to receive their respective shares in one amount. Where the capital ratio differs from the profit and loss ratio, it is difficult to determine the proper ratio in which the instalments should be paid, due to the fact that expenses and losses have not yet been determined. Consequently it is impossible to tell what the ultimate ratios will be in which the partners are to share the net assets. As the payment of instalments on an arbitrary basis might result ultimately in an overpayment of some partners and an underpayment of others, the only safe method of handling the situation is to pay the first instalments to those partners whose capital ratios are in excess of their profit and loss ratios until their capitals are reduced to the point where the capital ratios of all the partners are the same as their profit and loss ratios. As soon as this point is reached, the proceeds of the assets may be distributed to the partners on the basis of their profit and loss ratios, because these are now identical with their capital ratios. A more complete treatment of this problem will be found on pages 650 to 654 of the author's second volume.

=Treatment of Good-Will upon Liquidation by Sale.=—When dissolution is brought about by the sale of the entire business, it may happen that the amount realized on the assets is smaller than their book value, and the difference must be treated as a loss in accordance with the principles previously stated. Similarly, where the assets are sold and the price realized is larger than their book value, the excess constitutes a profit and must be distributed among the partners in profit and loss ratio. Usually such an excess is treated as a receipt on account of good-will, and two standard methods of booking it are employed. When good-will is mentioned in the sale contract and its value has been determined, it is brought on the books as an asset and transferred immediately to the partners' accounts. Thus, if the value is $15,000 and the profit and loss ratio is ■ to A, ■ to B, and ■ to C, the entry is:

Good-Will 15,000.00 A, Capital 6,000.00 B, Capital 6,000.00 C, Capital 3,000.00

Good-will is now shown as an asset, and the entry closing it off is the same as for the sale of the other assets, viz., a debit to Cash and a credit to Good-Will.

On the other hand, when good-will is not specified as such in the sale contract, but the amount realized on the sale of the assets is larger than their book values, this excess may be credited to Good-Will, which is then treated not as an asset account (as in the case given above) but as a profit and loss account. The balance of this account is closed out to the partners' accounts in profit-sharing ratios in the same way as above. The ultimate result is the same in either case; the first method is a little more complete since it shows the value of the asset good-will previous to its sale.

The formal entries by which the sale of any business is recorded on its books, whether single proprietorship, partnership, or corporation, are treated in Chapter XXXIX under corporations.

CHAPTER XXXVIII

THE CORPORATION

=Definition.=—The definition of a corporation, given by former Chief Justice Marshall as "an artificial being, invisible, intangible, and existing only in contemplation of the law," sets forth its fundamental characteristics, viz., artificial personality and creation by the law. Blackstone says, "A corporation is an artificial person created for preserving in perpetual succession certain rights which being conferred on natural persons only would fail in the process of time." Blackstone's definition lays particular emphasis on a characteristic not specifically mentioned by Marshall, that of perpetuity of succession. It is apparent that the corporation within the limits prescribed by statute has most of the attributes and powers of a person—it can sue and be sued, can hold and pass title to property, real and personal, can carry on business in its own name, is responsible to the extent of its entire property for the payment of its debts, etc.

=Growth of the Corporate Form of Organization.=—The corporate form of organization is being increasingly utilized for the conduct of business of almost every kind. It offers a much more attractive field to the investor who desires to place his surplus funds in productive enterprises and share in their profits without having the burdens of active management or the risk of losing his private fortune to satisfy the claims of business creditors should the undertaking prove unsuccessful. Just as the partnership is an advance over the sole proprietorship in point of business organization, efficiency, and ability to cope with larger undertakings, so the

corporation in some of its forms represents an advance over the partnership form of business organization. Its advantages and disadvantages in comparison with the partnership will be reviewed briefly.

=Advantages.=—Some of its advantages are:

1. Limited liability. Only corporation property can be levied on to satisfy the claims of creditors; the private fortunes of the individual stockholders cannot be touched. 2. Continued existence. The death, withdrawal, or bankruptcy of any of its members does not interfere with its existence. Its life may be terminated by voluntary dissolution, insolvency, expiration of charter life, forfeiture of charter to the state for misuse, non-use, or abuse of its privileges. 3. Transferability of its shares, and their use as collateral for private loans without injury to the credit of the corporation. 4. Larger capital. A partnership becomes unwieldy and inefficient if the number of partners becomes too large. The number of stockholders in a corporation is not limited and varies from one to many thousands in the larger corporations. Accordingly much more extensive fields of endeavor are open to the corporation because it can bring together and use advantageously the combined capitals of many persons. 5. Centralized control. Its method of internal organization is such that one man can be made the responsible head instead of the many heads of the partnership.

=Disadvantages.=—The chief disadvantages of the corporation may be summarized thus:

1. Comparative absence of personal interest of the managing officer. This is largely a theoretical drawback, inasmuch as it is usually required that the managing officer be a stockholder.

2. As a creature of the state, the corporation is subject to state legislative control. It is taxable by the state and is required to make periodic reports.

3. Its credit is dependent on the amount of its net assets and not on the fortunes of its individual owners.

4. Corporations are sometimes restricted as to the character of their business. In some states certain lines of business cannot be carried on by corporations.

5. In some states it is illegal for corporations to hold stock in other corporations.

In spite of these and other disadvantages, most of which are not serious, the advantages of the corporate form of organization far surpass those of the sole proprietorship or partnership.

=The Formation of a Corporation.=—Formerly a corporation could be brought into existence only by a special act of the legislature. As this method proved cumbersome and was subject to much abuse, it gave place in all states to general corporation statutes or enabling acts whereby an application in due form and according to statutory provisions is all that is necessary for organizing a corporation. Though the statutes differ for each state, they are uniform in the main points. The method of formation under the New York statute will be explained.

=Certificate of Incorporation—New York State.=—The form of application for a charter to do business as a corporation is known as a “certificate of incorporation.” This document must be prepared by at least three natural persons, two-thirds of which number must be citizens of the United States and at least one of whom must be a citizen of New York State. These persons are called the “incorporators.” Their certificate must be made out in the English language, signed by each incorporator, acknowledged before a notary public, and must contain:

1. The name of the corporation, in the English language. This must be different from the name of any other domestic or foreign corporation doing business in the state and must not contain in its title the words, “bank, trust, insurance, etc.”

2. The purpose or purposes for which it is created. There is practically no limitation as to the lines of endeavor the corporation may declare itself desirous of following, with the exception that banks, trust, transportation, and insurance companies, etc., come under special laws.

3. The amount of capital stock of the corporation, common and preferred if both are to be issued. Preferred stock of various classes may be authorized after incorporation. The minimum amount of capital required by the New York law is $500. One-half of the capital must be paid in within one year from the date of incorporation. The certificate must state also the amount of capital to be paid in before the corporation can commence business and this must not be less than $500. No debts can be contracted before that amount is paid in.

4. The number of shares into which the authorized capital is divided and the par value of each. This must not be less than $5 nor more than $100, although more recently capital stock has been authorized with no named par value.

5. The place in which the principal office is to be located, which must be within the state.

6. The contemplated duration of its life. This may be made perpetual.

7. The number of directors, which must not be less than three.

8. The names and post-office addresses of the directors for the first year. Directors usually are stockholders and at least one-fourth of the directors are subject to election annually.

9. The names and post-office addresses of the subscribers to the certificate of incorporation, and the number of shares in the corporation subscribed by each.

=Filing the Certificate—New York State.=—The certificate of incorporation is usually made out in triplicate. The original must be filed and recorded in the office of the Secretary of State; the duplicate certified by the Secretary must be filed with the clerk of the county in which the principal business office is to be located; and the certified triplicate is retained by the corporation in its own files. The fees for filing the certificate with the Secretary of State are $10, and for recording 15 cents per folio. The county clerk's fees are 6 cents per folio for filing.

=Organization Tax—New York State.=—Before the filing of the certificate, an organization tax of 1/20th of 1% of the authorized capital stock must be paid to the State Treasurer. Record of this payment is forwarded to the Secretary's office.

=Initial Acts of Corporation.=—When the corporation is ready to commence business, its first act is usually to call a meeting of the incorporators and directors for the purpose of adopting a set of by-laws—although this matter may be delegated to the board of directors. This meeting also authorizes the issue of stock at or above par in exchange for cash, labor, or property.

=State Control.=—The outside control of the corporation is vested in the state. The state constitution, the general corporation law, the statutes relating to business organizations in general, and the specific contract between the corporation and state embodied in its charter or certificate of incorporation—these form the basis for state control and the limits within which the corporation may act as an authorized person. If the corporation does an interstate business, it is subject also to the regulations of the Interstate Commerce Commission.

=Working Organization and Management.=—The corporation's owners, that is, the stockholders, are the source of all authority and control. Unlike the partnership where control and voice in the management are equally shared by the partners regardless of any inequality in their investments, the corporation ownership is evidenced by shares of stock and each share is given one vote. Thus each owner's authority and voting power are dependent upon the amount of his ownership of stock. He has, however, the right to delegate this power to another person by "power of attorney," and in this way it frequently happens that one stockholder exercises a power far beyond the amount of shares owned by him. Delegation of voting power frequently occurs when the stock is widely distributed geographically and is owned in small lots. In theory the agent or attorney entrusted with the voting power of others is simply carrying out the will of his principal, the real owner of the stock.

=Annual Election of Directors.=—Because of the number of stockholders and because many of them are engaged in other pursuits, one of the characteristics of the corporate form of management is that the owners frequently do not have direct control of their enterprise. Accordingly, at regular times, usually annually, the stockholders elect directors to whom are delegated the general oversight and control of the business. The board of directors thus elected stands in the place of the stockholders during the period between the annual meetings at which it renders account of its management.

=Officers.=—The board of directors elects officers of the company—usually a president, vice-president, treasurer, and secretary—to undertake the active management of the business; or the directors may appoint a general manager or superintendent on whom rests the active management and who is the executive head of the corporation. Thus the chief characteristic of the working organization of the corporation is the delegation of authority to a responsible head. The accountability of the officers to the board of directors, and of the directors to the stockholders, has so far proved the most efficient method of conducting modern business.

=The Showing of Proprietorship.=—The chief difference, from an accounting viewpoint, between the corporate form and other forms of business organization is in the showing of proprietorship. Vested proprietorship in a sole owner or partnership business is carried under the title of the different owners' capital accounts, and credit is extended by the public to such owners, not on the basis of what the particular business is worth, but on the reputation of the owners and what they are known to be worth outside the business as well as in the business. On the other hand, the law has relieved the owners of a corporation of individual liability for the debts of the corporation. Only the corporate property can be held liable for the satisfaction of creditors' claims. For their protection, the corporation is not allowed to impair its capital stock by the payment of any portion of it in dividends to the owners or to change the amount of its capital stock without special authority. The outstanding capital stock, in theory, represents to the prospective creditor the minimum value of the corporation assets which are supposed to be sufficient to meet in full the claims of creditors. Accordingly, the portion of the capital of a corporation represented by its capital stock is a fixed amount, and the increments or decrements of proprietorship are usually shown in a separate account called Surplus. This account must always be read with the Capital Stock account to ascertain the current or present capital as distinguished from the original.

The Surplus account is sometimes divided and shown under such titles as Profits, Reserves, Undivided Profits, Working Capital, etc. To ascertain full proprietorship or net worth, all such accounts must be included.

RECORDS PECULIAR TO A CORPORATION

=The Subscription Book and Subscription Ledger.=—Upon the proper filing and acceptance of the certificate of incorporation, authority is given the incorporators to secure subscriptions to the capital stock. Subscription books or blanks may then be opened, which usually contain a form of agreement somewhat as follows:

We, the undersigned, do hereby subscribe for and agree to take the number of shares of the capital stock of the Blank Company, par value ..... set opposite our names and pay for the same, ... per centum down, the remainder subject to the call of the board of directors.

Where the number of subscribers is large and especially if record must be made of the payment of calls, a Subscription Ledger or Instalment Book is used. This ledger has no set form but usually carries columns showing when the calls are to be made, when actually made, when paid, and the balance still due. A controlling account called "Subscribers" or "Subscription" is carried on the general ledger, with a special column in the cash book to gather the totals for posting.

=The Stock Certificate Book and Stock Ledger.=—A subscriber is, as such, a stockholder in the corporation even though his stock certificate may not yet have been issued to him. The stock certificate is merely evidence of ownership. It is usually issued from a book with perforated leaves similar to a check book, with stub to carry the essential data of the certificate. Directly from this stub, or through the medium of a stock journal, postings are made to the individual accounts in the stock ledger. This ledger which, in turn, is controlled by the Capital Stock account or accounts on the general ledger, carries the detailed information as to the number of shares issued, shares canceled, and balances held by each owner.

=The Stock Transfer Book.=—In the state of New York a stock transfer book must be kept, showing all the data in connection with transfers of shares, such as old and new stock certificate numbers, names of the parties, etc.

=The Minute Book.=—To preserve a record of the meetings of the directors and stockholders, and the business transacted thereat, use is made of a minute book kept by the secretary. This book, as the source of authority for all the important acts and policies of the corporation, is a most important record. The record should be a complete history of the corporation from its organization through the entire period of its existence.

=Other Records.=—When the stock is sold on the instalment plan, formal receipt of the payment of each instalment is sometimes made by means of an "Instalment Scrip Book," whose certificates or receipts are issued upon payment of each instalment. When full payment has been made, the instalment certificates are exchanged for the regular certificates of stock. A dividend book for recording the payment of dividends is sometimes kept, though the need for such a record has been largely eliminated through the use of dividend checks.

CHAPTER XXXIX

OPENING THE CORPORATION BOOKS

=Corporation Accounting Records.=—The method of recording the ordinary business transactions of a corporation is essentially the same as in the types of business organization previously discussed. The opening and closing of corporation accounts, however, as also the method of making the periodic summarization, call for the special treatment given in this chapter and the next.

=Proprietorship and Capital Stock.=—As stated before, the members of a stock corporation have their ownership evidenced by certificates of stock. The proprietorship or net worth of a corporation, as of the single proprietorship and partnership, is the excess of its assets over its liabilities. This excess is shown in the books by two accounts or two groups of accounts, viz., the Capital Stock account—or accounts—which represents the amount of outstanding shares; and the Surplus account—subdivided and carried under other titles, if desirable—which represents the excess of the proprietorship over the amount of capital stock. Each stockholder's share in the corporation is determined by the number of shares he possesses.

=Common and Preferred Stock.=—There may be various classes of stock. If only one kind is authorized at the beginning, the subsequent creation of other kinds requires an amendment of the charter. The usual classes of stock are common and preferred. As its name indicates, preferred stock has some kind of preference over the common or ordinary stock. This preference may be only in regard to dividends, or it may include preference as to ownership in the net assets in case of dissolution. Preferred stock usually carries a fixed dividend, payable before any dividend can be paid to the common stockholders.

Preferred stock is classified as cumulative and non-cumulative. The terms apply to the dividend liability of the corporation in the event that the continuity of dividend declarations is broken. The dividend on cumulative preferred stock accumulates and becomes a preferred claim for the amount accumulated since the time of the last dividend declaration. That is, the common shareholders are not entitled to receive any dividend until the preferred shareholders have received the amount of the accumulated total. Preferred stock that is non-cumulative does not possess this feature. A dividend once passed on such stock is not a preferred claim to profits as compared with the dividend rights of common stockholders, but lapses completely. Preferred stock is cumulative unless specified to the contrary.

The issue of No-par-value stock is authorized by thirteen different states. Very often in a corporation whose stock carries a stated par value, there is little real relationship between the actual value of the stock as indicated by the net assets of the corporation and its stated par value. The law requires that par-value stock be carried on the books at its stated par. If such stock has been sold or exchanged for assets of a lesser value, there is always the temptation to inflate the value of the assets in order to maintain it at the par of the stock issued for them. This tendency is not met in the use of stock carrying no par value. Such stock appears on the books at exactly the amount of the assets received in exchange for it. A purchaser of such stock, because of the fact that it carries no stated par value, is at once put on notice to investigate the values back of it. No-par-value stock may be either preferred or common. In the former instance, if the preference relates to the assets at the time of dissolution, each such share must state the amount of assets applicable to each share in case of liquidation of the corporation. This constitutes a preference claim, not over the creditors of the corporation, but only over the common stockholders.

Thus it is seen that there may be different classes of ownership of a corporation, the owners of one class having some advantages over the owners of the other classes. It should be understood, of course, that within each class the rights and duties of the owners are the same.

=Opening the Books of a Corporation.=—The opening entries of a corporation have to do with a correct treatment of capital stock, subscriptions, calls and instalments, payments by cash and by property, etc.

The charter to do business, granted a corporation by the state, gives it the right to sell shares of stock. These shares have no value in themselves and are worth only what the corporation can exchange them for, either in cash or other assets. There is, therefore, no reason for making a record on the books of account as distinguished from the corporation's minute book, of the corporation's right to issue stock and of the amount of the stock which it has a right to issue. Until the stock has been paid or subscribed for, no formal entry need be made on the books of account. Of course, full record of all deliberations and resolutions as to procedure and policy up to the time of the actual sale of the stock is carried in the minute book, and a concise narrative statement of the organization of the corporation, its purposes, the authorized capital stock issue, the number of shares, the par value of each share, if par value stock, and so forth, should always precede the formal opening entries in the journal. This record and that in the minute book should give all the information of this sort needed. There is a too prevalent tendency among bookkeepers to make all sorts of memorandum entries on the books of account. A memorandum entry is an entry which has no financial significance and is made merely as a reminder that transactions of financial significance may arise from that source.

Before a corporation can secure its charter it is necessary to make certain expenditures. These usually consist of fees paid to a lawyer for his services in assisting in drawing up the charter; fees for filing the certificate; the organization tax; the cost of the certificates of stock and stock records; and so forth. These expenditures must be met by the incorporators from their private funds but they are reimbursed from the funds received upon sale of the stock. It is, accordingly, customary in opening the books of a corporation to show first the sale of the stock before showing the expenditures for organization.

A number of different methods of opening the books are employed. The first of these does not make use of the memorandum entries referred to above, whereas the other two do use memorandum entries. The three methods will be illustrated by means of the problem given below. The entries are shown in journal form. It will be understood, of course, that those entries which involve cash will appear in the cash book only. All the other entries appear in the general journal.

PROBLEM 1. The Smith-Brown Company is incorporated with an authorized capital stock of $250,000, of which $150,000 is subscribed and paid for at par; the balance remains unissued for the present. The organization expenses are $1,000.

FIRST METHOD

THE SMITH-BROWN COMPANY A corporation organized under the State of New York, with an authorized capital stock of Two Hundred and Fifty Thousand dollars ($250,000), divided into Two Thousand, Five Hundred (2,500) shares of the par value of One Hundred dollars ($100) each, with all powers necessary to carry on the business of manufacturing, selling, and distributing motors of all kinds.

Case 1. Where the subscription and payment are not simultaneous:

(a) Subscribers 150,000.00 Capital Stock Subscriptions 150,000.00 To record subscriptions to the capital stock as follows: A shares B ” C ” Etc. (b) Cash 150,000.00 Subscribers 150,000.00 To credit subscribers for the payment of their subscriptions. (c) Capital Stock Subscriptions 150,000.00 Capital Stock 150,000.00 To record the issue of stock to all subscribers who have paid in full. (d) Organization Expense 1,000.00 Cash 1,000.00 To record the payment of the costs of organizing the corporation.

Entry (a) sets up the claim under subscription contracts against the subscribers as an asset of the corporation, and is offset by the proprietorship account, carried under the title “Capital Stock Subscriptions,” until payment has been made and the certificates of stock actually issued to the stockholders.

Entry (b) is self-explanatory.

Entry (c) shows the issue of the certificates and therefore transfers the proprietorship from Capital Stock Subscriptions to Capital Stock.

Case 2. Where the subscription and payment are simultaneous:

(a) Cash 150,000.00 Capital Stock 150,000.00 (b) Organization Expense 1,000.00 Cash 1,000.00

In a small corporation where a cash investment constitutes the entire original capital, the entries shown in case 1 above are sometimes abbreviated as here indicated. In such a case there is often no formal subscription contract entered into and there is therefore no need to set up accounts with Subscribers and Capital Stock Subscriptions.

SECOND METHOD. This method makes use of the memorandum accounts, Unissued Capital Stock and Capital Stock Authorized. Omitting the narrative statement of organization, the explanatory matter after the various entries, and the organization expense entry, which are common to all methods, the other necessary entries are as follows:

(a) Unissued Capital Stock 250,000.00 Capital Stock Authorized 250,000.00 (b) Subscribers 150,000.00 Capital Stock Subscriptions 150,000.00 (c) Cash 150,000.00 Subscribers 150,000.00 (d) Capital Stock Subscriptions 150,000.00 Capital Stock 150,000.00 (e) Capital Stock Authorized 150,000.00 Unissued Capital Stock 150,000.00

Entry (a) is a memorandum entry recording the amount of capital stock authorized by the corporation’s charter. This entry has little or no financial significance. Not until stock is sold does the corporation have any real assets.

Entry (b) shows that of the stock which was unissued under entry (a), $150,000, has been subscribed for, thus giving the corporation a legally enforcible claim—an asset—for that amount.

Entry (c) is self-explanatory.

Entry (d) shows the issue of the stock when the subscriptions are paid.

Entry (e) adjusts the memorandum entry (a), to show the present amount of authorized stock still unissued, viz., $100,000. Both accounts under (a) continue as memoranda only, and as they exactly offset each other, they will not appear on the balance sheet.

THIRD METHOD. This method also makes use of memorandum accounts before the sale of the stock. The difference between this and the second method should be noted. It will be seen that the credit of entry (a) is here Capital Stock instead of Capital Stock Authorized. This is theoretically incorrect because as yet the corporation has no proprietorship. The best that can be said for it is that the debit represents a contingent asset and the credit a contingent proprietorship item. The other entries are self-explanatory.

(a) Unissued Capital Stock 250,000.00 Capital Stock 250,000.00 (b) Subscribers 150,000.00 Subscriptions 150,000.00 (c) Cash 150,000.00 Subscribers 150,000.00 (d) Subscriptions 150,000.00 Unissued Capital Stock 150,000.00

=Premium or Discount on Stock.=—The law requires that when stock of par value is issued, the Capital Stock account must be carried always at par. When stock is sold at a premium or at a discount, it necessitates, therefore, the use of supplementary proprietorship accounts to make the proper record. In the state of New York, a corporation cannot sell its stock at a discount, but in states where this is allowed the amount of such discounts should be charged to a “Discount on Stock” or some similar account. Sometimes the charge is made to “Organization Expense.” The use of Organization Expense account for this purpose is contrary to the principle that the account title should show the exact nature of the items recorded under it. It is misleading and sometimes reprehensible. A full discussion of this matter is given in Volume II. When stock is sold above par, the amount of the premium is recorded in the account “Premium on Stock,” which as usually handled constitutes a part of the permanent capital of the corporation. Premiums on stock sales should not be credited to Surplus account. The following illustration will show the kind of entries required:

PROBLEM 2. Of the $100,000 unissued stock of Problem 1, we will assume that $50,000 is later subscribed for at 98, and $50,000 at 102.

Entries to make the record according to the first method, Problem 1, are as follows:

(a) Covering stock subscribed for at a discount: Subscribers 49,000.00 Discount on Capital Stock 1,000.00 Capital Stock Subscriptions 50,000.00 (b) For stock subscribed for at 102: Subscribers 51,000.00 Premium on Capital Stock 1,000.00 Capital Stock Subscriptions 50,000.00

Entries for payment of the subscription and issue of the stock follow the method of entry already shown on page 342. It will be observed that the Capital Stock Subscription and the Capital Stock accounts are always shown at par value.

=Capital Stock on the Balance Sheet.=—The net worth section of the balance sheet of a corporation will usually appear somewhat as follows for the capital stock items. Often, however, more detail is shown in connection with the surplus item. The student should note how full information is given concerning the capital stock.

(1) _Net Worth_

Represented by: Capital Stock: Authorized $250,000.00 Unissued 100,000.00 ---------- Issued and Outstanding $150,000.00 Premium on Capital Stock 5,000.00 Surplus 60,000.00 ---------- Total Net Worth $215,000.00 ==========

Where the discount on stock has not been charged off against Surplus either because sufficient profits have not been reserved, or because, although sufficient profits have been reserved, it is deemed desirable to build up a larger balance of Surplus before charging off the discount, the net worth section will appear as follows:

(2) _Net Worth_

Represented by: Capital Stock: Authorized $250,000.00 Unissued 100,000.00 ---------- Issued and Outstanding $150,000.00 Surplus 10,000.00 ---------- $160,000.00 Discount on Capital Stock 15,000.00 ---------- Total Net Worth $145,000.00 ==========

Discount on capital stock should usually be shown as above, although one sometimes finds it listed among the assets on a balance sheet. This is not wholly objectionable unless it is set up under a title which does not indicate its true nature.

=Instalments.=—The subscription contract sometimes provides for payment by instalments. The corporation usually issues to all such subscribers a “call,” i.e., a notice that an instalment payment will come due at a given time. The subscriber is not considered delinquent until the call has been made and he has not responded. The accounts must therefore reflect the difference in status brought about by a “call.” This is accomplished by transferring the claim against the subscriber carried in Subscribers account to a new claim against him carried under Call account. The illustrations below show the accounts required and their handling.

PROBLEM 3. Assume that the $50,000 of stock subscribed for at 102 is to be paid for one-half in cash and the remainder in two equal instalments at the end of successive three-month periods.

For the one-half cash payment the entry is as follows:

Cash 25,500.00 Subscribers 25,500.00

At the end of the first three months, the record is:

Call No. 1 12,750.00 Subscribers 12,750.00 To show the call issued. Cash 12,750.00 Call No. 1 12,750.00 To record payment of the first call.

Similar entries at the end of the second three months are:

Call No. 2. 12,750.00 Subscribers 12,750.00 Cash 12,750.00 Call No. 2 12,750.00

If the call is not paid in full at balance sheet time, the debit balance in the “Call” accounts constitutes an asset, i.e., the amount of unpaid instalments due from subscribers. Upon full payment of all subscriptions, certificates of stock are issued and recorded as shown on pages 341, 342.

=Entries for Common and Preferred Stock.=—Where more than one kind of stock is issued, such as common and one or more kinds of preferred, separate capital stock accounts—and usually other related accounts—should be kept for each class, as illustrated below:

PROBLEM 4. Assume that the stock of a corporation is $200,000 common and $50,000 preferred, and that $100,000 common and $50,000 preferred have been subscribed for. The entries necessary to record the subscription in accordance with the first method explained above, are:

Subscribers—Capital Stock Common 100,000.00 Capital Stock Common, Subscriptions 100,000.00 Subscribers—Capital Stock Preferred 50,000.00 Capital Stock Preferred, Subscriptions 50,000.00

The other entries for payment of subscriptions and issue of stock are essentially the same as explained above, but the record of the transactions affecting common and preferred stock should always be kept distinct and separate.

=Entries for No-Par Stock.=—When a corporation issues no-par stock, the amount of proprietorship resulting from its sale is exactly what the stock brings and is so recorded; there is neither discount nor premium. Booking it is, therefore, simple. The amount of capital so secured, i.e., secured from its sale, should, however, never be mixed with the accretions to capital from reserved profits or other sources. Such items constitute the Surplus just as in the case of stock of par value, and the legal requirement that these amounts be kept separate from the capital stock are just as strict. This is necessary so that the records will clearly show that dividends have not encroached upon the capital. Since the value at which no-par stock is carried on the books bears no relation to the number of shares issued, it is customary to carry on the balance sheet information as to the number of shares outstanding. The net worth section of the balance sheet of a corporation issuing no-par stock should appear as follows:

Net Worth

Represented by: Capital Stock—No Par: Authorized 10,000 shares Unissued 3,000 ” ------ Issued and Outstanding 7,000 ” $369,465.00 Surplus 125,479.00 ---------- Total Net Worth $494,944.00 ==========

=Payment of Subscriptions by Property.=—When payment of subscriptions is by property instead of by cash, the value at which such property shall be brought onto the books is entirely at the discretion of the corporation’s directors, and unless fraud can be shown, their valuations are final. No difficulties are involved in recording such a payment; the paid properties are debited under suitable account titles, and the Subscribers account is credited. The following problem illustrates the change from a partnership to a

corporation, at the same time showing how the payment of subscriptions by property must be treated.

=Change from Partnership to Corporation=

PROBLEM 5. A and B, partners, incorporate as the American Baking Company. The authorized capitalization is $250,000. Each partner subscribes for an amount of stock equal to his interest in the partnership, and C, an outsider, subscribes for the remainder of the stock at par. The corporation purchases the assets and assumes the liabilities of the partnership, paying therefor with stock as above. C pays his subscription in cash. The balance sheet of the partnership on that date was as follows:

BALANCE SHEET OF A & B Cash $ 20,000.00 Accounts Payable $ 45,000.00 Accounts Receivable 150,000.00 Mortgage Payable 80,000.00 Merchandise 50,000.00 A, Capital 125,000.00 Plant 130,000.00 B, Capital 100,000.00 ---------- ---------- $350,000.00 $350,000.00

Make the opening entries for the new corporation and also close the books of the partnership.

1. The entries to open the corporation's books:

(a) Subscribers 250,000.00 Capital Stock Subscriptions 250,000.00 To record subscriptions to the capital stock as follows: A 125,000 B 100,000 C 25,000

(b) Cash 20,000.00 Accounts Receivable 150,000.00 Merchandise 50,000.00 Plant 130,000.00 A & B, Vendors 350,000.00 To record the purchase from A & B of their partnership assets. (c) A & B, Vendors 125,000.00 Accounts Payable 45,000.00 Mortgage Payable 80,000.00 To record partial payment to A & B for their assets by the assumption of their liabilities. (d) A & B, Vendors 225,000.00 Subscribers 225,000.00 To record full payment to A & B for the balance due them, by the cancellation of their subscription indebtedness. (e) Cash 25,000.00 Subscribers 25,000.00 To record payment by C of his subscription contract. (f) Capital Stock Subscriptions 250,000.00 Capital Stock 250,000.00 To record the issue of stock to all subscribers, who have paid in full.

Entries (b), (c), and (d) are sometimes combined in the following compound entry:

Cash 20,000.00 Accounts Receivable 150,000.00 Merchandise 50,000.00 Plant 130,000.00 Accounts Payable 45,000.00 Mortgage Payable 80,000.00 Subscribers 225,000.00

Although this accomplishes the same result so far as the ultimate showing is concerned, it does not present the various steps of the transactions so clearly as the separate entries. The "A & B, Vendors" account in entry (b) indicates the liability of the corporation to A & B, arising from the purchase of their partnership properties. Entries (c) and (d) show the manner in which A and B are paid for this purchase, with consequent cancellation of that liability.

2. The entries to close the books of the partnership of A & B are:

(a) American Baking Company 350,000.00 Cash 20,000.00 Accounts Receivable 150,000.00 Merchandise 50,000.00 Plant 130,000.00 To charge the American Baking Company with the assets purchased under contract of (date). (b) Accounts Payable 45,000.00 Mortgage Payable 80,000.00 American Baking Company 125,000.00 To credit the American Baking Company under their purchase contract for the taking over of the firm's liabilities. (c) American Baking Company Stock 225,000.00 American Baking Company 225,000.00 To credit the American Baking Company for the payment of the balance due by the issue of its stock at par to the firm. (d) A, Capital 125,000.00 B, Capital 100,000.00 American Baking Company Stock 225,000.00 To show the distribution of the stock.

Where the stock is issued to each partner directly (instead of to the firm and then distributed to the vendors), sometimes the issue is not shown on the partnership books, entry (c) above carrying debits to the partner's capital accounts in place of the debit to American Baking Company Stock. Whether the actual transaction follows one course or the other, entries as shown above seem to meet either requirement.

The student should make sure that the effect of the entries under (a) and (b) is thoroughly understood. It may be further noted that if good-will or shrinkage of values enters into the sale of a partnership, the necessary adjustments should be made in the partners' accounts before the sale takes place, after which the closing entries are as shown above.

CHAPTER XL

CURRENT AND CLOSING ENTRIES FOR THE CORPORATION

=Relation between the Corporation and Its Owners.=—It should be noted that the owners of a corporation are on a somewhat different basis in their relationships and activities to the business than are the owners of a partnership or single proprietorship business. The legal theory that the corporation is an entity, a person, separate and apart from its owners, necessitates a change in the status of accounts with owners as compared with similar accounts in the other types of organization. A charge against a stockholder as a customer of the corporation is on the same basis as a charge against any other customer. A stockholder may become a creditor of the corporation in exactly the same way as any other person. In a partnership, on the other hand, charges against a partner and credits to his account are looked upon as charges against and credits to his proprietary interest in the event of liquidation of the firm. This is not true in the case of a corporation, stockholders in such dealings being considered “outside” parties.

=Current Record on Corporation Books.=—After the corporation has been organized and the opening entries made on its books, the record of current transactions proceeds on practically the same basis as in all other types of business organization. Sales, purchases, cash receipts and disbursements, notes receivable and payable, and all the transactions arising out of them, are recorded currently in the same types of books and in the same manner as the similar transactions of a single proprietorship or a partnership.

While the record of current transactions is practically the same for all types of business organizations, there are some kinds of current transactions of a corporation which differ somewhat from those of the other types. They arise out of the nature of the corporation and are recorded under account titles peculiar to the corporate form. Some of these transactions and other accounting records will be discussed briefly.

=Treasury Stock.=—In some classes of enterprise and also under some methods of organizing and financing the corporation, no provision is made for the securing of a fund of working capital, all of the original capital being tied up in fixed assets—as a mine or some other plant. A similar condition is sometimes encountered even after a corporation has been operating for a number of years. Lack of business judgment and financial foresight sometimes brings about a condition in which the company has allowed an undue proportion of its current assets, and therefore its working capital, to become tied up in plant extensions.

In both such cases a frequent method of raising working capital is for the stockholders to donate to the corporation a pro rata portion of their holdings of stock to enable it to secure the needed working capital by selling the stock. When such stock comes back into the company’s treasury, it is termed “treasury stock.” Having once been issued and presumably fully paid for, it has this characteristic which does not attach to the original shares before their issue, viz., that it can be sold at a discount without the purchasers being liable to creditors, in case of bankruptcy, for the amount of the discount. Par-value stock which is originally sold at a discount or which is being sold on the instalment plan and has not therefore been paid for in full is subject to levy for the unpaid amount in the event of bankruptcy of the corporation. Thus, the man who buys a $100 share of original stock for $90, is subject to a $10 levy in the event that the assets of the corporation are not sufficient to pay its debts.

Accordingly, in financing highly speculative ventures such as mining, oil, and other similar companies, it is customary to issue the entire capital stock of the company to the owner or owners of the mining or oil property taken over by the corporation as the basis for its operations. Inasmuch as the value of the properties taken over is not determinable, it is usually impossible to show that the stock issued for them does not represent their true value. Accordingly, such stock is legally fully paid stock and not subject to the liability for additional assessment which attaches to stock sold at a discount. Working capital is provided through the donation of a portion of the capital stock to the treasury of the corporation, which is then in a position to sell to others the stock now fully paid and non-assessable. It is easier to find purchasers for this stock because it can be sold at whatever discount is necessary to dispose of it and carries with it no liability for future assessment.

Treasury stock may arise also through repurchase by the company. It may sometimes be desirable for a company to buy back some of its own stock. This is not allowed in all states but where allowed such stock repurchased becomes treasury stock.

The student should distinguish carefully between treasury stock and unissued stock.

=Accounting for Treasury Stock.=—The record of treasury stock transactions is not complicated. They are discussed under three heads as follows:

1. RECORD AT TIME OF ACQUISITION. Only the acquisition through donation will be explained here. Acquisition through purchase usually involves an adjustment of purchase price to par value and the vexed problem of valuation. This problem will be found discussed on page 18, Volume II.

Assume that a company has issued all its capital stock, $1,000,000 in amount, for the acquisition of a mining property, and that the shareholders donate to the treasury $400,000 of the stock to provide working capital. This stock donation will be recorded on the books as follows:

Treasury Stock 400,000.00 Donated Surplus 400,000.00

Like any other gift, this gift of stock in theory creates additional capital and must therefore be recorded in a proprietorship account. The title “Donated Surplus” is used to indicate the source of this additional capital. Capital arising from this source should never be recorded in the general Surplus account, largely because of its problematical value but also because of the information which it gives concerning the financing of the company by making a separate record.

2. RECORD AT TIME OF SALE. Assume that $250,000 of the treasury stock is sold at 50. Inasmuch as the stock was brought on the books at par, the portion sold must be taken off at the same figure. The 50% discount, instead of being recorded in a Capital Stock Discount account, will be recorded as a charge against the Donated Surplus, thus adjusting a portion of this donated surplus, recorded originally at par value, to its realizable value. The following entry records the sale and adjustment:

Cash 125,000.00 Donated Surplus 125,000.00 Treasury Stock 250,000.00

The student should understand that the customary procedure of opening the subscription books, making the entries with subscribers for treasury stock subscriptions, payment in cash or by instalments, and finally, the issue of the stock, may be the procedure followed in the sale of treasury stock just as in the sale of other stock. The net result will, however, be as shown by the above entry.

3. RECORD OF TREASURY STOCK ON THE BALANCE SHEET. On the balance sheet treasury stock is treated in the same way as unissued stock, namely, as a deduction item in the net worth section of the balance sheet. Using the above figures for illustration, the net worth section will appear as follows:

Net Worth Represented by: Capital Stock: Authorized $1,000,000.00 Treasury Stock 150,000.00 ---------- Issued and Outstanding $850,000.00 Donated Surplus 275,000.00 ---------- Total Net Worth $1,125,000.00

=Bonds Payable.=—Generally, when a corporation borrows money on long-term notes secured by a portion of its fixed assets, chiefly its holdings of real estate, the notes (usually of uniform amounts so as to make them more marketable) are called “bonds.” Thus, such notes or bonds are frequently in $100, $500, and $1,000 denominations, making it possible for one of limited means to take advantage of the mortgage offered as security for the loan. Bond issues are floated in pretty much the same way as capital stock issues, being offered for subscription at a price depending both on the interest rate which the bonds bear and the prevailing interest rate at the time of their offering. Thus, if the bonds bear 5% interest and the market rate for bonds of the same general character is 6%, an investor will naturally not be willing to pay par for them and the company will therefore have to sell them at such a discount as will put the yield to the investor approximately on a 6% basis. The company, by receiving for its bonds an amount less than par value but by being required to pay interest on the par amount, is thus paying higher than the nominal or agreed rate.

There is thus a very definite relationship between the bond discount and the interest rate which the bonds bear.

The accounting record of bond transactions is very similar to that of other liability transactions, and is shown under three heads as follows:

1. SALE OF BONDS PAYABLE. Assume that a $100,000 issue of bonds bearing 5% interest, payable semiannually, and maturing in 20 years, is sold at 90. The record will be:

Cash 90,000.00 Bond Discount 10,000.00 Bonds Payable 100,000.00

Bonds payable are always set up at par, since that represents the liability which must be met at maturity of the issue.

2. BOND INTEREST PAYMENT. At the close of the first six months, 2½% interest, or $2,500, will be paid to the holders of the bonds. Since the corporation will have to redeem its bonds at par, it has been deprived of the use of $10,000, represented by bond

discount, because the issue was brought out at 5%. The $10,000 discount is therefore in the nature of a lump sum interest cost incurred in advance—prepaid—and must be spread equitably over the life of the bonds. Accordingly, at each of the 40 interest payments during the life of the issue, a pro rata share of this prepaid interest should be taken into account as bond interest. The distribution of bond discount over the interest payments made during the life of a bond issue is termed “amortization” of the discount. Scientifically, amortization is worked out on a compound interest basis, discussion and explanation of which are found on page 269, Volume II. Here, all we are concerned with is the principle involved and for the sake of simplicity the amortization is prorated evenly over the 40 interest periods, resulting in an additional interest charge of $250 each period. The record is therefore:

Bond Interest 2,750.00 Bond Discount 250.00 Cash 2,500.00

3. CANCELLATION OR THE BONDS AT MATURITY. When the bonds come due and are paid, the record is the same as the cancellation of any other liability, viz.,

Bonds Payable 100,000.00 Cash 100,000.00

=Bond Premium.=—Bonds are also often sold at a premium. As with discount, the premium is intimately related to the interest rate which the bonds bear. At the time of the sale of bonds, the premium is brought on the books as a credit, which together with the par value at which the bonds are booked, offsets the cash received from their sale. At the regular interest periods the premium is amortized over the life of the bonds and so results in a lessening of the periodic bond interest charge. The student should set up the entries to record the sale of bonds at a premium and the interest payment for such bonds.

=Sinking Fund.=—The sinking fund is a fund of liquid assets created by periodic sums, usually of equal amounts, set aside during the life of a bond issue or other liability to provide ready funds for the cancellation of the liability at maturity. This method is very commonly followed in public finance and is not infrequent in private corporations. It is not purposed here to explain the methods of determining what periodic sum is necessary to be set aside so that these principal sums and their interest accumulations will provide sufficient funds for the cancellation of the liability at maturity. Nor will the complicated problem of sinking fund investments in the hands of a trustee, and the expense and income arising out of it, be discussed here. These and related problems are covered fully in Chapter XXV, Volume II. Only the creation of the fund and its final disposition are treated here, under two heads as follows:

1. CREATION OF THE FUND. Assume that $1,000 cash is set aside at the end of each six months to provide for the retirement of the bonds at maturity. The entry for this, every six months, will be:

Sinking Fund 1,000.00 Cash 1,000.00

2. CANCELLATION OF THE BOND LIABILITY. The student will understand that the cash set aside periodically for the sinking fund will be invested in securities in order to accumulate an income, which usually accrues to the fund. The securities in the fund must be sold just before the maturity of the bond issue, in order to provide cash. It will be assumed that in this instance the securities in the fund have been sold, that the cash in the sinking fund at the time of maturity is $101,500, and that the bond issue to be retired is $100,000. The entries will be:

(a) Bonds Payable 100,000.00 Sinking Fund 100,000.00 (b) Cash 1,500.00 Sinking Fund 1,500.00

Entry (b) returns to the general cash the unused cash in the sinking fund. In case of a deficiency in the sinking fund it will be necessary, of course, to draw on the general cash for the amount of the deficiency.

=Sinking Fund Reserve.=—It is often the policy of a corporation, which has to provide for the redemption of a bond issue, to reserve from the yearly profits a sum equal to the periodic payment into the sinking fund and the accumulations of the fund during that period. Such a policy prevents the distribution by dividends of all the current profits to stockholders, and insures that the increase in the assets represented by these profits will be held in the business and so provide each period an increased amount of assets for use in the business and ultimately, by conversion of the assets into cash, for the use of the sinking fund. The entries crediting the sinking fund reserve and showing its disposition at the maturity of the bonds are as follows:

(a) Surplus (or Profit and Loss) 1,000.00 Sinking Fund Reserve 1,000.00 (b) Sinking Fund Reserve 100,000.00 Capital Surplus (or Surplus) 100,000.00

The first entry shows the periodic reservation of profits. The second entry transfers the total profits so reserved during the life of the bonds, back to surplus—capital surplus if it is desired that these profits be made a part of the permanent capital of the corporation,

or to general surplus in the event that these profits are to be made available for future dividends.

=Closing the Books of the Corporation.=—The results of the period's operations are summarized and the books closed in very much the same way as with the partnership. From what has been said above, it will be understood that there are some types of transactions to be considered at the time of closing the corporation's books that are not found in the partnership and single proprietorship. These concern largely the bond interest, the sinking fund reserve, and the dividend transactions. Bond interest is an expense. The sinking fund reserve is a reserve of net profits. Two methods are employed in showing the appropriation of net profits. Under the one method the total net profit is transferred to Surplus account, which then shows not only the profit for the current year but also the undistributed balance of previous years. The current appropriations of profits for whatever purpose are then booked as a charge against Surplus. Under the other method the current appropriations of profits are shown as charges against the net balance in the Profit and Loss account. Any unappropriated profit remaining is then transferred to the Surplus account.

=Dividends.=—A business is being operated always for the benefit of its owners, to whom the profits belong. In the case of a corporation, before the owners may secure any of the profits, a formal declaration of dividends must be made by the board of directors. During the term of its election the board is supreme in its management of the business. It is intimately in touch with the condition of the business. It knows the needs of the corporation and its obligations and must provide for them. If, after considering all the circumstances, it decides that some or all of the profits should be divided among the shareholders rather than be retained in the business for purposes of expansion, it meets in regular session and passes a formal dividend resolution.

=Ultimate Control of Stockholders.=—Thus it is seen that the board of directors is supreme during the period of its incumbency. Its actions are, however, subject to the review of the stockholders at their periodic meetings, which are usually held annually. If their policies are not favored by the shareholders, a new board, presumably one which will carry out the will of the majority of stockholders, is elected.

=Dividends Out of Profits Only.=—It is forbidden by law to pay dividends out of the capital of the corporation. Such payments would encroach upon the net assets of the organization and thereby weaken the creditors' security for the payment of their claims. Dividends need not be paid out of the profits of the current year, provided the undistributed profits of former periods are still available.

=Distribution of Profits.=—The appropriation of profits in a corporation differs, therefore, from that in a partnership. The entries recording the appropriation of profits cover in the main two kinds: (1) reserves, and (2) dividends. These entries are not necessarily the same for all corporations nor for all periods. No set disposition of profits is prescribed, authority resting with the directors. Their decision, therefore, as recorded in the minutes of their meetings is the basis for this group of entries. Some of the usual entries are illustrated in the following paragraphs.

=Reserves and Dividends.=—As stated above, the two methods for handling the appropriation of profits are: (1) as a charge against Surplus after the net profit for the current period has been transferred to that account; and (2) as a charge against the current Profit and Loss credit balance and a transfer of the remaining balance, if any, to the Surplus account.

A part of the profits may be retained in the business to provide funds for certain future needs, as for the payment of fixed debts, the extension of fixed plant, etc. Such items are transferred to the credit of properly named reserve accounts. Profits for distribution as dividends are similarly transferred to a Dividends Payable account. The dividend is always based on the amount of outstanding stock, not on the unissued or treasury stock. It is reckoned either as a percentage of the par value of each share, as a 6% dividend, or as a stated amount on each share, as a dividend of $4 or 10 cents per share.

The following illustration will show the necessary entries in accordance with the two methods.

PROBLEM. Assume that the net profits of Jackson & Co. are $25,000. The directors declare an 8% dividend on the outstanding capital stock of $100,000, and order $5,000 to be transferred to a reserve for buildings and $7,000 to a reserve for the cancellation of a bond issue.

FIRST METHOD Profit and Loss 25,000.00 Surplus 25,000.00 To transfer net profits to Surplus. Surplus 20,000.00 Dividends Payable 8,000.00 Building Fund Reserve 5,000.00 Sinking Fund Reserve 7,000.00

SECOND METHOD Profit and Loss 20,000.00 Dividends Payable 8,000.00 Building Fund Reserve 5,000.00 Sinking Fund Reserve 7,000.00 To appropriate profits as per resolution of the directors. Profit and Loss 5,000.00 Surplus 5,000.00 To transfer balance to Surplus account.

=Dividend Liability.=—The student should note that the effect of a dividend declaration is to change a portion of the proprietorship into a liability. Surplus is decreased and liabilities are increased. The liability so created ranks with other liabilities, i.e., the assets of the corporation may be used to pay the liability to its stockholders equally with the payment of liabilities to outside creditors. The payment of such dividend is recorded by the cancellation of the dividend liability, as follows:

Dividends Payable 8,000.00 Cash 8,000.00

Where there is more than one class of stock outstanding, it is customary to keep separate dividend accounts with each class.

=Other Methods of Adjusting and Closing the Books.=—It seems desirable at this point, although the material is applicable to any type of business organization, to discuss other methods of adjusting and closing the books than those heretofore explained. In Chapter XXVIII and previous chapters, the methods of handling deferred expense and income, and of summarizing the merchandising transactions were shown. The method given there of adjusting the ledger because of deferred expenses rested upon a classification of the various expense accounts to be adjusted as temporary proprietorship accounts. The method of adjustment effected a transfer out of the current part of the account, the asset portion of the expense, and carried it over into the next period. The balance remaining in the account after this adjustment shows the expense, that is, the amount of service or use, chargeable to the current period.

Another method of handling such items is based on an asset classification of the accounts recording them. Under this hypothesis such account titles as Postage, Stationery, Wrapping Supplies, and even Insurance (that is, unexpired insurance), are classed as asset accounts. At the close of the period when the adjustments are made, it is necessary to transfer from such asset accounts only the portions used or consumed during the current period. The balances left in the accounts represent the unused assets carried over into the next period. The difference between the two methods is indicated by the two sets of adjusting and closing entries given below.

PROBLEM. Assume that $1,000 of insurance has been purchased during the current period and that at its close unexpired insurance is $250.

FIRST METHOD. The adjustment of the Insurance account classified as an expense account is here made by the following entry:

Insurance (Deferred) 250.00 Insurance 250.00

The closing entry would be:

Profit and Loss 750.00 Insurance 750.00

The ledger account would show as follows:

INSURANCE ========== 19— | 19— Jan. 15 500.00 | Dec. 31 Deferred as unexpired 250.00 June 15 500.00 | Profit and Loss 750.00 -------- | -------- 1,000.00 | 1,000.00 ======== | ======== 19— | Jan. 1 250.00 | |

SECOND METHOD. The Insurance account is here looked upon as an asset account. The only adjustment necessary, therefore, is to remove from it the portion used, the portion remaining unused being an asset. This is effected by the following entry:

Profit and Loss 750.00 Insurance 750.00

The ledger account would appear as follows:

INSURANCE ========== 19— | 19— Jan. 15 500.00 | Dec. 31 Profit and Loss 750.00 June 15 500.00 |

In favor of the first method it may be said that it brings out more sharply the difference between asset and expense accounts and the need for separating mixed accounts into their two elements of expense and asset. The second method requires less work.

=The Trading or Selling Account.=—For the purpose of summarizing the merchandising activities a separate account called Trading or Merchandise Trading is sometimes used to effect the partial summarization heretofore explained as being made in the Purchases and Sales accounts respectively. Where so used the Trading account becomes virtually the old Merchandise account with totals in place of details. The following entries will show its content and the method of handling it.

Trading 10,000.00 Merchandise Inventory 10,000.00 To transfer opening inventory. Merchandise Inventory 12,000.00 Trading 12,000.00 To set up new inventory. Trading 100,000.00 Purchases 100,000.00 To transfer purchases for the period. Trading 3,000.00 In-Freight and Cartage 3,000.00 To transfer in-freight and cartage expense. Purchase Returns and Allowances 5,000.00 Trading 5,000.00 To transfer. Sales 150,000.00 Trading 150,000.00 To transfer. Trading 6,000.00 Sales Returns and Allowances 6,000.00 Trading 48,000.00 Profit and Loss 48,000.00 To transfer the gross profit on sales.

The Trading account is thus used as a means of separating the net sales into its two elements: (1) income, or gross profits; and (2) decrease of assets, or the cost of goods sold. This method makes the Profit and Loss account a purely summary account of income and expenses. Its chief disadvantage, however, is that a picture of the entire operations for the period is not presented in one account. One seldom finds the Trading account used in actual practice. It does serve, however, as an efficient teaching device to bring out clearly the way in which the merchandise accounts are adjusted and summarized in order to effect a separation of the income and decrease in asset elements.

CHAPTER XLI

HANDLING THE CASH

=General Considerations.=—In keeping record of the various properties of a concern, the greatest care is usually exercised in accounting for the asset cash. This is done because of the difficulty in tracing money that is lost or stolen and the ease with which the thief may get rid of it, due to its universal use as a medium of exchange, and due also to its great value in comparison with its small bulk. Merchandise, supplies, and the like, may be purloined or misappropriated, but not so easily and profitably. Oftentimes, however, unless care is exercised in safe-keeping it, large losses occur also in merchandise. Absolute prevention of losses cannot be expected even with the employment of all possible precautions, but experience shows that certain general safeguards may be placed about both cash and merchandise. In the ultimate analysis the best safeguard is the integrity of the employee; still the employer should not tempt the employee by making the abstraction of his cash an easy performance.

=Principle of the Double Record.=—A fundamental principle in the handling of cash is to secure a double—not a duplicate—record of its receipt and disbursement. The practice of depositing in a bank all cash receipts and making disbursements only by check should be followed invariably, because it secures this double record—the bank's record and the cashier's record. Any discrepancy is detected whenever comparison of the two records is made. When the bank's record is compared with the cash book record, the balances shown by each are seldom in agreement, chiefly because of the outstanding checks which have not yet been presented to the bank for payment. This requires a reconciliation of the two balances before proof of correctness is secured, which is usually accomplished by subtracting from the bank balance the amount of the outstanding checks. Other adjustments are sometimes necessary. These are explained and a form of reconciliation statement is shown on page 475.

Most concerns object, however, to issuing checks for small amounts, and set therefore a minimum below which they do not issue them. For the purpose of paying smaller amounts, a petty cash fund is provided from which disbursements are made in cash. This fund is established, in the first instance, by a check on the general cash and is from time to time replenished in the same way. In this manner the double record is maintained.

=Handling the Petty Cash.=—There are two general methods of handling the petty cash. Under the one, entry of the check creating the fund is made as an immediate charge to some expense account and no further accounting is required. This method is based on the theory that the cash is to be used for petty expenses anyway, and might as well be so charged now as later. Subsequent amounts for replenishment of the petty cash are treated in the same way. The objection to this method, from the accounting viewpoint, is that it results in an inaccurate record of expense distribution and a misstatement of the facts in that it charges to expense an item which at the time of the charge is still a part of the general cash fund. The second and chief objection is that it encourages in the petty cashier loose methods in handling and accounting for the fund, as usually no strict reckoning is required.

The second method, known as the "imprest method," is in more general favor. This charges the original check creating the fund to an account called "Petty Cash." The petty cashier is required to secure a receipted bill, sales ticket, or other voucher for every petty

cash item of expenditure, so that at all times the amount of cash in his possession added to the receipted bills and vouchers must equal the original amount in the fund. Usually the fund is a fixed amount, its size depending upon the needs of the business for these small expenditures. When the cash in the fund becomes low, the petty cashier turns over his receipted bills to the general cashier, who issues a check for their exact total to replenish the petty cash by the amount of its depletion, thus restoring it to its original fixed amount.

The expenditures as shown by the receipted bills and vouchers are classified and entered by either of the following two methods: (1) as a charge to the several accounts through the general cash book, offsetting the petty cash replenishing check; in this case no charge appears in the “Petty Cash” account except the item covering the original check; or (2) by an entry through the journal debiting the various expenses and other items and crediting Petty Cash. This latter method necessitates charging in the general cash book the replenishing check to Petty Cash as an offset to the journal credit of the same amount. Most accountants consider the postings to the Petty Cash unnecessary—except the original—and so check both in cash book and journal. If, however, posting to the Petty Cash account in the general ledger is made whenever the fund is replenished, this will serve to indicate the activity of the fund on the face of the ledger account—information which could just as easily be obtained from the petty cash book. The imprest method thus effects a careful accounting of the petty expenditures.

=The Petty Cash Book.=—The petty cash book is usually a columnar record with the amount columns to the right of the explanation space. The first column is the receipts column, the second the disbursements column, and the others show under appropriate titles the distribution of disbursements. One form of the book is shown in Form 39, with typical entries and balancing.

[Illustration: Form 39. Petty Cash Book]

Sometimes the classified summary which is made the basis of the general cash book or journal entry referred to above, is shown in the petty cash book, the account titles being written in the explanation column, with the amounts opposite in the credit column underneath the $100 total. The items of this summary are then posted to the ledger, and the debit of the replenishing check to Petty Cash on the general cash book is “checked” in the ledger folio column. Or if the distributive column titles give sufficiently analyzed account titles, their totals may be posted without formal summarization, posting being shown by the small-figure ledger page in each column, as in the illustration. Where the petty cash book is used as a posting medium, of course no summarization of it is made either in the journal or the general cash book.

=Keeping the Bank Account.=—Several different methods of keeping the bank account are in use. Sometimes the check stub is the only record kept; in Chapter XXIII reference was made to the two methods of keeping the account for the entry of deposits—either on the face or the back of the stub. When the entry is made on the face, each check is usually subtracted from the previous balance and the new balance is shown. When deposits are recorded on the back of the stub—or on a special deposit interleaf—check totals and deposit totals may be carried forward from leaf to leaf without showing any balance.

A better method is to use the stub only as a memo from which to make formal entry in the cash book columns—one for deposits on the debit side and one for checks on the credit side. These bank columns may be used, first, for the purpose of keeping the bank account, by showing the totals of deposits—but not the items composing each deposit—and the totals of the checks that have been drawn; and second, for the purpose of furnishing weekly or monthly totals for posting to a ledger account kept with the bank, thus making the ledger self-balancing without having to bring in the cash book balance.

If, however, the principle of double record (explained earlier in the chapter) is followed, there is no need of a _special_ bank deposits column, since the total of the Net Cash column gives the amount of each day’s deposits, and similarly the Net Cash column on the credit side shows the checks drawn against the bank. Thus the policy of depositing in the bank all receipts and disbursing only by check has an added advantage in that it simplifies the keeping of the record of cash as well as proving it. Under this method, the cash journals may be summarized, just as the other journals, and posted to a Cash account in the ledger. Detailed instructions for the handling of the entries, balancing, and closing under this method are given in Chapter XXXI.

Another and rather unusual method of keeping the cash book is to carry a Currency column on each side, supplemented by Bank columns for deposits and checks on the debit and credit sides respectively. In the debit Currency column are entered all receipts of money in regular course. When the bank deposit is made up, its amount is entered as a charge to the bank in the credit Currency column and also, as a memo, in the debit Bank column. As checks are drawn they are entered in the credit Bank column. Thus the balance of the Currency columns should show the actual amount of cash in the cash drawer at any time, and the difference between the Bank columns should show the balance in the bank. Though somewhat complicated, the method has its advantages

under conditions where currency accumulates before being deposited in the bank.

Of course, under all methods of keeping the cash record, the requirement that all cash received be deposited and payment be made only by check should be strictly adhered to.

=Entering Checks on the Cash Book.=—When all disbursements are by check, every check drawn must be entered on the cash book and accounted for. Entry should be made in numerical sequence with suitable explanation of any spoiled checks. The amount of the spoiled check may be left blank or entered as usual, but in the latter case the spoiled check must also be included in the day's deposits, and the bank's cancellation stamp must be secured. Neither the deposit nor disbursement is posted, each entry being marked "contra" by way of explanation. This effects an inflation of the total receipts and disbursements, but inasmuch as the bank's record also shows the inflation, an adequate safeguard is secured. The new check replacing the one spoiled is entered in regular order.

The method just discussed is perhaps the best way of recording the exchange of checks for cash. Sometimes a concern is asked to exchange its check for currency, the party making the request desiring to send the check through the mails or for some other purpose. The entry is best made on both the debit and the credit side of the cash book with reference "contra" in each case, but neither entry need be posted. This makes the cash book record check against the bank record and shows the full history of the transaction. When a check is cashed in currency, or when a check of larger amount is received in payment of a debt and the difference is returned in cash, no record need be made of the check, as only the nature—not the amount—of the deposit for the day is changed and no disbursement is made which affects the bank account. When, however, a check is issued for "change" in lieu of currency, record should be made, debit and credit, as shown above.

=Branch Cash—The Working Fund.=—Frequently cash working funds must be provided for the current expenses of branches or of a factory located at a distance from the main office. When the branch or factory keeps a separate set of books, it must be charged with the advances of the working fund and a careful audit of the way the fund is handled must be made periodically, just as would be done with an independent concern.

Such cash transfers may also be handled by the imprest method as explained above. The original advance is charged to "Factory" or "Branch Cash," and is deposited in the branch's local bank to the credit of the head office, the branch having the privilege of using it. The branch may draw checks against the fund, sending the canceled checks to the head office as supporting vouchers for its disbursements. These canceled checks become the basis for the replenishing checks and also for the charges for branch expenditures made on the head office books.

If the branch is a selling agency making sales for cash and on account, a modification of the system is necessary. Daily reports should be required from the branch. Its cash receipts should be deposited daily and a duplicate deposit ticket should be forwarded to the head office by the bank. The bank should be asked also to forward all canceled checks. All collections on customers' accounts should be made from the head office. This does not prevent the abstraction of cash before deposit, but it at least places control or oversight of the bank cash account in the hands of the head office and secures a careful accounting of it.

=Safeguarding Cash—General Principles.=—Proper safeguards for the cash should always be provided. The method of the double record—the bank's and the owner's cash book—is good so far as it goes and acts as a check on cash transactions _after_ the record is made, but does not insure that the cash book record will be made correctly in the first place. There are ways in which cash received may get into the cashier's or salesmen's pockets instead of the cash book. No system or method has yet been devised to prevent this entirely. Every system must rest at some point upon the integrity of the human agent, and will fail of its full efficiency and intended results if the agent fails in the trust reposed in him. Every effort should be made to prevent both petty thievery—the abstraction of small sums at every opportunity—and systematic robbery mapped out and planned with infinite care and detail. Only everlasting vigilance and a system of "checks" will secure satisfactory results, as occasionally it is the _trusted_ employee who is not true to the trust placed in him.

=Internal Check.=—By internal check is meant the method by which employees check each other's records, control not resting entirely in any one clerk. Thus a system of record-making which combines the work of the cashier and bookkeeper under one clerk or which gives the cashier access to the ledgers is one which invites dishonesty.

Where the cashier has entire control of the cash, and besides opens the incoming mail, makes up his daily deposits, has his pass-books balanced periodically, and files the canceled checks, he has every opportunity to abstract cash and falsify his records.

But where he must make detailed daily reports of the cash to the manager, treasurer, or some other officer; where he is denied access to the records—except his own cash record—and where his record is subject to periodic proof; where the mail is opened first and receipts listed by an independent clerk; where a careful system of proving receipts from cash sales and of allowing no unauthorized deliveries over the counter is employed; where every member of the office force is required to take a vacation during which his work and records are cared for by other employees—there is a very satisfactory system of internal safeguards and checks.

All these devices and systems are applicable in full only in large concerns where minute division of duties is possible. In smaller concerns where many duties have to be combined under one person, the problem of safeguarding the cash and providing other measures to prevent fraud of various sorts is more difficult. In such a concern, at least the cash received through the mail should be listed first by someone other than the cashier or bookkeeper, and the daily deposit slip should be compared with this list to see that all the cash items are included. The cash received from cash sales should also be proved daily against the sales tickets.

=Statement of Receipts and Disbursements.=—A periodic report of cash is usually made by means of a statement of receipts and disbursements. This statement is an abstract or summary of the cash book, showing the total receipts from various sources and the causes of the disbursements and their totals. A simple form is given below:

[Illustration: Form 40. Weekly Statement of Receipts and Disbursements]

To assist in checking past deposits, an itemized record of daily cash receipts is often kept, analyzed as to gold, silver, currency, notes and checks. To be of value this record should be filed with the daily deposit tickets and should be later available for purposes of comparison.

CHAPTER XLII

NOTES RECEIVABLE AND PAYABLE

=Conditions Precedent to the Present Use of Notes and Bills.=—During the twelfth and thirteenth centuries there was much bad money in circulation in Europe because of the widespread practice of coin-shaving and the entire lack of standards of purity of the coins. If a monarch needed funds for war or government purposes, his easiest way of getting them was to increase the amount of base alloy in the coins of the country or to increase the rate of seigniorage. As the former method might be resorted to several times during the reign of one sovereign, the weight and relative purity of metallic coins had no relation to the denominated value of the coins, and they fell under general suspicion. Consequently, only the money dealers, who could determine the actual value of coins by assaying them, were willing to trade for coins. These men gradually became the custodians of moneys for merchants, who were given receipts showing the assay value of the coins deposited. Because the receipt represented tested and proven value, it was a more acceptable medium of exchange than the coins themselves.

Medieval trade was subject to many perils, chief of which was that from robbers. Any safeguards placed about the transportation of money from one place to another, or any method devised for settling debts without the transportation of coin and bullion, were more than welcome. Out of these conditions arose the method of settling debts by means of drafts. The draft, not countenanced by law at first, had standing, however, under the “law merchant,” the code of rules recognized by merchants as governing commercial relations. This code was later incorporated by statute into the law of the country.

These two kinds of paper, the one a receipt for coin which was in the nature of a demand promise to pay, the other a counterpart of the modern draft, were the forerunners of our promissory notes and bills of exchange of the present day. The law with regard to the bill or draft became settled as the result of the practice of merchants sooner than that relating to notes.

=The Titles “Notes” and “Bills.”=—In this way, the word “bill” became an established term. The titles “bills receivable” and “bills payable” still cling to both classes of items. Inasmuch as the accepted bill is practically identical with the promissory note, and the title “bill” is so often used interchangeably with the word “invoice,” it is advisable to use the terms _notes receivable_ and _notes payable_ instead of bills receivable and bills payable. Some advocate the use of the title “acceptances” in order to distinguish accepted bills from promissory notes. Unless these two classes of paper are large enough in volume to justify it, little advantage is secured by this separation of their bookkeeping record. However, in the case of trade acceptances, i.e., acceptances based on particular sales of goods and therefore evidencing bona fide commercial transactions as the basis for the extension of credit, it is advisable, because of their superior rating in the money markets, to segregate this class of acceptances from notes and other

acceptances.

=Relation of the Note to the Open Account.=—In the preliminary discussion of the relation of the note to the open account in Chapter XXI, it was pointed out that both the note and account are claims against the person liable for payment; and that the one is carried under a class title “notes receivable,” because the number of such notes is usually small, while each account receivable is carried under a separate title which designates the person liable for payment. The essential difference between the two kinds of claims is that the note is an acknowledgment of the justice of the claim and the correctness of the amount, whereas the claim under the open account may be disputed and in case of dispute requires outside proof; besides, the open account may always be offset by counterclaims and sometimes by a return of all or a part of the goods bought.

Any defenses of value under the contract for which the note was given are good defenses as between the original parties to a note; but not so as between the maker and a third party who is an innocent purchaser for value. To him the maker is liable according to the exact terms and tenor of the note. Only so could the element of negotiability be insured and the note pass from hand to hand as money. In no other sense is the note a preferred claim over the open account.

In case of bankruptcy a claim against the bankrupt under an open account and a claim under a promissory note or an acceptance made by the bankrupt before his insolvency, rank alike, both sharing pro rata in the net assets available for the satisfaction of the total claim of unsecured creditors.

=Relative Liquidity of the Note and Open Account.=—Compared with the liquidity of open accounts, promissory notes have a slight advantage in that they can more readily be turned into cash and at a better rate. Although an assignment of open accounts is possible by hypothecating them with a third party, the cost of such assignment is almost prohibitive and is resorted to only where the customary sources of credit are not available.

The legitimacy and the low cost of discounting notes greatly increase their liquidity. Oftentimes the question of risk, i.e., the degree of certainty of their payment when due, enters into the determination of the relative liquidity as between open accounts and promissory notes, but from this standpoint there is little, if any, difference between the two claims. Occasionally a firm, which refuses to pay its debts on open account, will meet its notes and acceptances in an effort to bolster its credit at the local banks. This phase of the question does not usually enter into the discounting operation, where the credit of the discounter is the determining factor in raising money. Of course, this may be only a temporary expedient if the note is dishonored and charged back to the bank. In some lines of business it is very common practice to secure notes for overdue accounts. If the Notes Receivable account contains many such items, its liquidity is seriously to be doubted. However, the note is usually classed as a more liquid asset than the open account.

=Method of Recording Notes.=—As to the accounting phase, a record is made of each note received or given, entry being to Notes Receivable or Payable, as the case may be. If the note transactions are few in number, the general journal is used for their record. Ample explanation must be given as to the essential facts of date, maker, for what received, rate of interest, due date, etc. Notes receivable must be watched carefully, as failure to present them when due releases all indorsers. There is nothing unusual in the entry when made in the general journal, its debit and credit being determined as indicated in Chapter XI.

=The Note Journals.=—Because the general journal does not lend itself to an easy record of the essential data pertaining to note transactions, a separate book is oftentimes kept for this purpose. This special book may be used merely as a memorandum record for carrying the detailed explanation of the Journal entry; or it may become a special journal that is used as an integral part of the accounting system, and, when so used, posting to the ledgers is made direct therefrom. The use of this special journal is always advisable when note transactions are numerous. A bills or notes receivable journal may be ruled as shown on Form 41. The notes payable journal differs but slightly from the notes receivable journal.

[Illustration: Form 41. Notes Receivable Journal (left and right hand pages)]

If the bill book is for memorandum use only, the “Amounts Credited” columns may be omitted. If it is a real note _journal_, its debit and credit equilibrium is shown through summary entry at posting time. The total debit is to Notes Receivable for the amount of that column’s total. If it were not for the fact that sometimes notes are received in whose face amount is included not only the credit to the customer but an interest item as well, there would be no need of credit columns. The note journal would then be operated just as is any simple special journal, with a debit to Notes Receivable and the same amount credited to the customer; but when interest is included, the note is best recorded in an additional column, separating the credit to Customers from that to Interest. If notes are

numerous, a distributive column in the cash book should be used for receipts from notes, in order to secure a total posting to the credit of Notes Receivable account.

Referring to the left-hand page of the illustrated ruling (Form 41), the face amount of the note receivable is entered in the Notes Receivable column, and the due date in one of the narrow columns headed “When Due,” each of these columns representing a separate month. In this way it is easy to find the total of all the notes due in a given month and the amount of cash to be expected from their payment. For this purpose, however, it is best to use a note journal arranged by _months of maturity_ on the principle of a “tickler.” In such a journal one page is reserved for each month, and the notes are entered, not on the page for the month when received, but on that for the month when due. Thus a note received in January and due in March should be entered on the March page. To secure a summary of all notes received during each month for posting to Notes Receivable account at the end of each month, the various month pages are totaled and “recapped” on a special page. On this “recap” page, at the end of January, say, will be entered the total of the January page, giving the notes received in and maturing during January; the total of the February page, giving the notes received in January but maturing in February; etc., for each month during the year. The grand total is the amount to be posted to the general ledger, representing all notes received during January.

This type of journal gives easy control over maturities, and forecasts for a given month the amount of cash receipts from notes.

=Notes Entered at Face Value Always.=—Some notes are interest-bearing from their date of issue; others only after their due date when not paid. Even on non-interest-bearing notes, the law allows the charging of interest for their overdue period. From the standpoint of strict accuracy, a note payable at a future time is not worth its face value at the time of entry, unless it is interest-bearing from date at approximately as high a rate as the current discount rate. Its present value is such an amount as when placed on interest will equal the face at its due date. That value increases day by day until it reaches par or face on the due date. Because of the practical difficulties encountered in the numerous adjustments necessary under any other method of entry, universal practice countenances the bringing of the note onto the books at a slightly inflated value, i.e., face value, at the time of entry. Face value is the amount of the credit to the customer’s account; it shows the amount to be collected on account of the note; and if interest-bearing, the amount on which the interest is based. Accordingly, the note transaction is entered at its face value. Where the note is interest-bearing and the face plus the interest is paid at maturity, credit is in two items, one to Notes Receivable for the face, and the other to Interest Income for the amount received as interest.

Occasionally, the interest for the period the note is to run is added to the amount of the debt, and the sum is made the face of a non-interest-bearing note. The purpose of such procedure is to secure a compounding of interest for the first period if the note is not paid at maturity. The entry of the note on the books is a debit to Notes Receivable for its face, and credits to the customer for the amount of the debt and to Interest Income for the amount of the interest. Only a credit to Notes Receivable is made when the note is paid. The credit to Interest Income, before the interest is actually earned and received, is necessitated by its pre-estimate and inclusion in the face of the note. Were a balance sheet drawn up on that date, the entire amount of this interest would be shown as deferred income.

=The Interest Accounts.=—As explained in Chapter XV, when interest items are numerous two interest accounts are usually carried on the ledger, one for Interest Income and one for Interest Cost. Sometimes, however, only the one account, Interest and Discount, is carried, and if it is desirable to separate the two classes of interest, it may be done by entering the debit and credit totals of the Interest and Discount account—instead of simply the balance—when the trial balance is taken. Needless to say, bank discount—interest paid in advance—is the only kind of discount recorded under this account title; it must not be confused with discounts on sales and purchases, which receive different accounting treatment.

CHAPTER XLIII

PROBLEMS ENCOUNTERED IN RECORDING NOTES RECEIVABLE AND PAYABLE

=Entries in the Account.=—The elementary discussion of entries to the note accounts in Chapter XIV will be reviewed and amplified here.

Where the Notes Receivable account in the ledger shows each note separately rather than the totals of the items, good practice countenances the recording of the _credits_ in this account in non-chronologic order. Thus, when a customer settles his promissory note and the document is returned to him, the credit to Notes Receivable should be entered directly opposite the original debit item. This brings each complete note transaction on a single line and shows at a glance which notes are outstanding, as evidenced by

the blank lines on the credit side of the account.

When, however, the credit items are entered in chronological order, the same purpose may be accomplished by the use of an index figure for the original debit and the corresponding credit item.

What has been said above applies equally to notes payable.

=The Discounted Note.=—In the booking of notes receivable discounted and accepted drafts, a problem arises because of the legal right accorded the holders of notes, in case of non-payment by the maker, to look for payment to any or all of the indorsers, provided certain formal requirements are complied with. Whenever a business house transfers a note by any method of indorsement (except the qualified), it incurs a _contingent liability_, which may become a _real liability_ if the maker of the note fails to meet the obligation at maturity. Since it is the function of good accounting to present _all_ the financial facts bearing on the business, it is evident that whenever a contingent liability is incurred, it should be entered in the books of account. Very frequently, however, this liability is ignored, with the result that it is eventually lost sight of altogether.

The usual, though incorrect, method of journalizing a note discounted transaction is as follows:

Cash Interest Cost Notes Receivable

Usually when an asset is sold, a credit to the account of the asset sold is correct, but not so in the case of notes sold, i.e., of notes discounted. For the purpose of showing the complete facts, the entry at the time of discount should be made as follows:

Cash Interest Cost Notes Receivable Discounted

and at maturity when the note is paid by the maker:

Notes Receivable Discounted Notes Receivable

The effect of the first entry is to set up a suspense account, Notes Receivable Discounted, representing the contingent liability on the discounted note. The effect of the second entry is, first, to cancel the _credit_ of the Notes Receivable Discounted account, because upon payment of the note by the maker the contingent liability ceases; and second, to cancel the original _debit_ to the Notes Receivable account which was made at the time the promissory note was received but which remained _unchanged_ when the note was discounted, because it was still needed to record the contingent asset which would become a real asset in case the contingent liability became a real liability.

It has been argued that the above treatment of discounted notes stretches the theory of debit and credit nearly to the breaking point. It must be observed, however, that unless accounting records are so kept as to give the necessary information, they are not serving the purpose which justifies their existence. Any theory which prevents the proper functioning of the records must be changed; there is no place for it.

It would be incorrect, however, to regard Notes Receivable Discounted as an independent liability account, because it only represents a contingent liability. The two accounts, Notes Receivable and Notes Receivable Discounted, must be considered together, the latter account being set up merely for the purpose of keeping notes discounted under review until their final status is determined. The purpose of the Notes Receivable Discounted account is in a way similar to that of the valuation accounts of depreciating assets. The asset account is held at its original figure, and in order to determine the present value of the asset, the valuation account must be referred to. Similarly, the asset account, Notes Receivable, is held at its original figure, even though some or all of the notes are discounted, and in order to know the amount of notes receivable actually on hand, the credit of the Notes Discounted account must be subtracted from the debit of the Notes Receivable account. In the balance sheet, Notes Receivable Discounted is not shown as a liability item, but appears as a deduction from Notes Receivable, only the difference, representing the amount of notes actually in possession, being extended among the assets. It should be noted, however, that this contingent liability is oftentimes shown on the liability side of the balance sheet, the corresponding asset, Notes Receivable, then being separated into two items, “Notes on Hand,” and “Notes under Discount per contra.” Banks uniformly follow this practice in showing these and similar items.

At maturity of the note the final entry (Notes Receivable Discounted debit and Notes Receivable credit) is placed upon the books as illustrated above. Usually no formal notice is received by the indorser that the note has been paid by the maker. In case the note is dishonored, prompt notice would be sent, and failure to receive such notice implies that the note has been duly paid.

What has been said above concerning notes applies equally to accepted drafts, the legal character of which is identical with that of notes, the status of the drawer of an accepted draft being the same as that of the first indorser of a promissory note. The contingent liability arising from the transfer of all negotiable instruments should usually be shown.

In some instances, however, there may be good practical reasons for not adhering to the above principle. When, for instance, a large number of notes and acceptances are handled and the experience of the business shows that few of them are ever dishonored, or if the matter is under constant review by the financial manager, it might be considered an unnecessary requirement to make use of a separate Notes Receivable Discounted account. It must be left to the judgment of the accountant to decide which method is preferable in connection with the needs of the business. However, if no current account is kept to show the contingent liability, at the end of the period the balance sheet must be made to show the amount of discounted notes still outstanding as of the closing date of the period.

=The Dishonored Note.=—A note is dishonored either when the maker refuses payment upon its legal presentation at maturity or when there is sufficient evidence that he intends to refuse. When a note is dishonored, a formal protest is required in order to hold the indorsers. The payee appears before a notary public or some other officer with notarial powers, and makes oath that legal presentment of the note has been made and that the payment was refused. The notary then takes the note and personally presents it for payment to the maker. If payment is still refused, the notary makes a certificate of protest and mails notices of the protest to all indorsers desired to be held. Such notice is sufficient basis for action to recover from the party or parties thus notified.

In making the accounting record of a dishonored note, a number of problems may arise. These problems deal with these two situations: (1) when the note is dishonored in the hands of the named payee; and (2) when the note has been discounted by him and is charged back on account of dishonor. To illustrate the entries required, take the following two cases:

PROBLEM. Case 1. Promissory note made by P. Canning for $100. Payee, D. Johnson. Due December 15. At maturity Johnson presents the note for payment, but payment is refused.

Case 2. Promissory note for $250 made by P. Canning. Payee, D. Johnson. Due December 15. Note was discounted by Johnson. Final holder is A. Andrews who presents the note for payment on December 15, but payment is refused.

The questions arising in connection with these two cases may be stated as follows: What record should be made on December 15—

(a) By D. Johnson in case 1. (b) By A. Andrews in case 2. (c) By D. Johnson in case 2.

(a) D. Johnson, at the time he received the note from Canning, made the following entry:

Notes Receivable 100.00 P. Canning 100.00

and on December 15, in order to show that the note is dishonored, he may make either of the following two entries:

(1) P. Canning 100.00 Notes Receivable 100.00

or

(2) Notes Receivable Dishonored 100.00 Notes Receivable 100.00

Entry (1) takes the charge out of the note account and sets it up again as a claim on Canning’s open account. Entry (2) transfers the charge to a Notes Receivable Dishonored account. Entry (2) is theoretically a better entry than entry (1), because from the latter it might be inferred that the nature of the claim has changed from a note claim to an open account claim. Such change has not taken place, however; Johnson’s claim against Canning is still on the note. Therefore, entry (1) is not true to the facts.

On the other hand, entry (1) has an important advantage over entry (2), because by posting entry (1) Canning’s personal account in the ledger is made to show the fact that one of his promissory notes was dishonored. This is a matter of very great importance, especially if Canning should again apply for an extension of credit.

If the second method is adopted, it is clear that the posting of the entry will not show the dishonor of the note on Canning’s account. It is essential, therefore, that the bookkeeper should make a special memo of the fact in that account. If the bookkeeper could be depended upon to make such memorandum entry, the desired purpose of making Canning’s account show a complete record of all dealings with him would be accomplished. Any treatment consistent with accounting principles and securing a complete history in

one place of all dealings with the same individual satisfies all requirements.

(b) A. Andrews, who is the last indorsee of the note, should make the following entry at the time the note is dishonored:

Notes Receivable Dishonored 250.00 Notes Receivable 250.00

The Notes Receivable Dishonored account represents Andrews' claim against any or all the indorsers whom he wishes to hold responsible. Instead of this, an entry might be made corresponding to entry (1) discussed above.

(c) In case the note should be charged back to Johnson, either by Andrews or by one of the other indorsers, he should make the following entries:

Notes Receivable Discounted 250.00 Cash 250.00 P. Canning (or Notes Receivable Dishonored) 250.00 Notes Receivable 250.00

It will be noticed that these two entries completely reverse the two original entries made by Johnson, viz.:

Notes Receivable 250.00 P. Canning 250.00

at the time he received the promissory note from Canning, and

Cash 250.00 Notes Receivable Discounted 250.00

when he transferred the note by indorsement.

It is to be understood that all expenses in connection with the dishonored note should be charged either to the personal account of the maker or to the Notes Receivable Dishonored account, as the case may be.

Where the Notes Receivable Dishonored account is used, it secures a good analysis of the claims against customers from the standpoint of probable realization and gives a relatively better basis for the bad debts estimate than that offered by the other manner of treatment. Of course, the use of such an account is limited to the ledger; it never appears as such on the balance sheet, being included there in the customers' accounts with ample reserve for uncollectible items.

=The Classification of Notes.=—The Notes Receivable account should carry only the short-time notes of customers, and thus be a truly current asset. Long-time notes and those secured by mortgage should be booked under separate account titles. For a similar reason, the notes receivable given by officers, employees, or stockholders of the corporation should have separate booking, as these notes are given for the purpose of making formal record and acknowledgment of indebtedness, usually without regard to time of payment. Such notes do not constitute easily convertible assets, and therefore should not be recorded under the same account with short-time customers' notes.

=Notes Receivable Out as Collateral.=—Notes receivable are sometimes given as collateral security for a loan. When they are so used, no bookkeeping problem is involved—though a memorandum to show their use as such should appear in the note account, and in case a balance sheet is drawn up, a cross-reference or a footnote should indicate the liability secured by the notes. However, the sale of the notes to satisfy the loan constitutes a regular business transaction, which should be recorded in the proper manner.

=Note Renewals and Partial Payments.=—The renewal of notes and partial payments are other features met in the accounting for notes. The renewal of a note is rather a question of business policy than of accounting procedure. When a note is renewed, it is usually better to deliver up the old note and secure a new one in its stead. The accounts should reflect the transaction by showing cancellation of the old and receipt of the new note. If the old note is extended, a memorandum of that fact should be entered in the ledger account.

From the financial standpoint, if neither note is interest-bearing, the amount of the renewal note should be larger than that of the old note, to cover the cost of deferring payment to a future date. For example, if the old note amounts to $1,000 and is renewed two months later, the amount of the new note should be fixed at $1,000 plus 1% interest, or $1,010.

In accounting for partial payments, no new accounting principle is involved. When such payments are numerous, additional space in the note journal and in the ledger should be provided for the purpose of facilitating the actual work of making the book record.

CHAPTER XLIV

DISCOUNTS

=Definition and Kinds.=—A discount is a deduction from a listed or named figure. The manufacturer or wholesaler in making up his catalogue for the trade usually enters his products at certain prices—called “list prices”—which are not selling prices but only nominal amounts on which the actual sale prices are based. For reasons to be explained later, he offers buyers a deduction from list prices which is called “trade discount.” The usual quotation of sale prices is at so many per cent below the list prices.

Among practically all merchants it is a very common practice to bill goods to customers with settlement allowed on an optional basis. The goods may be billed “net,” i.e., the full amount shown in the invoice must be paid. Since there is a relationship between the time allowed for payment and the amount to be paid, most concerns have an established credit term, at the end of which they expect full settlement of the account, but, as an inducement for earlier payment, they offer a reduction in the amount to be paid. This is stated usually at so much per cent below the billed price, and is generally called “cash discount.” The practice had its origin in conditions prevailing at the close of the Civil War when business failures were numerous and the risk on open accounts even for short credit terms was very great.

Bankers when making loans usually deduct from the face of the loan the interest charge for the use of the money. This deduction is called “bank discount.”

Merchants usually allow a deduction for the prepayment of a customer’s note, and this is called “commercial discount,” to distinguish it from bank discount, although the two kinds of discount are essentially identical; the only difference being that in the one case a bank buys a merchant’s note, while in the other case it is a transaction between two commercial houses, the one buying back its own note before it is legally due.

Trade discounts are very seldom recorded on the books, the actual selling price and not the list price being entered. Cash discounts are invariably recorded. If the merchant knew at the time of the sale which optional basis of settlement the buyer would choose, he could record the transaction at a net figure on that basis without entering the discount portion. This would, of course, result in a varying figure at which sales were booked. Accordingly, the almost invariable practice is to record sales at the gross amount and show by means of the Sales Discount account the acceptance of any lesser sum in settlement in accordance with the sales contract. Bank discount has to be booked in order to show the cost of the loan which is the difference between the asset received, cash, and the asset parted with, notes. The matter of bank discount has been treated in some detail in Chapter XLII.

=The Method and Purpose of Trade Discount.=—Trade discounts are so universally met with in business that an extended discussion of them will be of value to the student. As has been stated, a trade discount is a deduction from the list price and it serves two purposes. It is apparent that the prices listed in the catalogue cannot be changed until a new catalogue is printed and that it would not be practicable to print a new catalogue to make a change in selling prices. Therefore, instead of reprinting the catalogue whenever market prices fluctuate and a change in the list prices must be made, sheets containing the discounts allowed from list prices are published, the expense of which is much less than that of a new catalogue.

The other purpose served by the trade discount is in partly concealing the real quotation. Without the rate of discount allowed from that list, the catalogue tells nothing of the real price. In this way a concern in publishing its catalogue does not lay itself open to the risk of being underbid by competitors publishing later catalogues.

Prices may be quoted at a single discount or by means of a series of discounts, each taking as its base the net amount left after deducting the next preceding discount. Examples will illustrate:

1. Goods listed at $250 are quoted at 20% off. The sale price here is $200. 2. Goods listed at $500 are quoted at 50% and 20% off. 50% off $500 leaves $250. 20% ” $250 ” $200—the same real sale price as in No. 1. 3. Goods listed at $750 are priced at 50%, 33■%, and 20% off. 50% off $750 leaves $375. 33■% ” $375 ” $250. 20% ” $250 ” $200—the same as in Nos. 1 and 2.

It is apparent that the _list_ prices without the trade discounts tell nothing as to the _real_ prices.

=Methods of Calculation.=—Short methods for calculating trade discounts when given in a series are often employed. For a series of only two discounts, a single rate equivalent to the two may be found by subtracting their product from their sum—always treating them as decimals. Thus a series of 20 and 20 is equivalent to a single rate of 36,

(.20 + .20 = .40; .20 × .20 = .04; .40 - .04 = .36).

Another method of calculating trade discounts, and one applicable to a series of any number of discounts, is to treat the discount off as equivalent to one-minus-the-discount on. Thus a discount of 15% is equivalent to 85% of the list. An additional discount of 10% is equivalent to 90% of the new base, or 90% of 85% of the original list, or 76.5%. Thus a continued multiplication of the "percentages on" gives the single sale price multiplier to be applied to the list price. If the single discount rate is desired, it is secured by subtracting the multiplier from 1, or 100%. Take the series 60, 20, 10, and 10 off. This is equivalent to 40, 80, 90, and 90 on, or 25.92% on

(.40 × .80 × .90 ×. 90 = .2592).

The single discount rate equivalent to the series is, therefore, 74.08% (100%-25.92% = 74.08%).

The _order_ in which the discounts of a series are used is immaterial, as the order of the factors does not affect the product.

The method just illustrated develops the reason for the first special rule given above for a series of two discounts. Let the discounts be "_a_"% and "_b_"%. The "percentages on" are, therefore, (1 -_a_)% and (1-_b_)% whose product, algebraically, is 1- [(_a_ + _b_)-_ab_], which is the single "percentage on"; from which it is readily seen that the single rate discount is _a_ + _b_-_ab_, i.e., the sum of the two rates minus their product. Similar rules can be developed for longer series, but they are too complicated for easy application.

There is now available a "discolog" table, an ingenious reference table, which is operated somewhat like a logarithmic table. It gives quickly and easily the single discount rate equivalent to any series of discounts.

The chief value of the single rate equivalent to the discount series is in its use for comparative purposes, as it indicates which of two discount series is the more favorable. When a large number of selling prices must be computed, all having the same discount series, the single rate method of calculation also has a great advantage over the long method, which makes use of the series. This is true especially when the work is done with the use of a calculating machine.

=The Nature of Cash Discount—Its Basic Elements.=—Where goods are sold on credit with a cash discount offering, four main factors of cost, not incurred when goods are sold for cash, must be provided for. These are:

1. Credit investigation and collection expense. 2. Bookkeeping and billing expense. 3. Loss from uncollectible accounts. 4. Interest for the use of the money—credit.

The cash discount is offered to free the vendor especially from costs (3) and (4), which are the heaviest of the four.

There is a direct relation between the credit period and the loss from bad debts. Thus, if a credit period of 30 days results in a given volume of such losses an extension of the credit term to 60 days would undoubtedly result in increased losses, assuming that all factors, such as investigation of the risk, credit supervision, collection effort, etc., remain the same. Inasmuch as the sale price must be sufficiently high to provide for loss from bad debts, the credit term enters into the determination of the price.

The other of the two main factors of cost, the interest charge on the cash sale price, represents the cost of being deprived of the use of the capital tied up in outstanding accounts.

Thus, when a discount is offered for early settlement, under normal conditions the controlling factors are the risk or cost of insurance against loss from bad debts and the interest cost. Special circumstances, however, may make it expedient to offer more or less favorable terms of settlement. Normally, terms of 2% off if paid within 10 days, the billed price being on a 30-day credit period (2/10, n/30), measures two things: (1) the saving secured by receipt of the money 20 days earlier; and (2) the saving in the item of bad debts expense brought about by shortening the term for which credit is extended from 30 to 10 days. How much of the cash discount is for interest and how much for bad debts can be seen by comparing the current interest rate, say 6%, with the discount rate reduced to a yearly basis. A discount of 2% which effects the collection of a debt at the end of 10 days, when the net credit term is 30 days, secures the use of the money by the vendor 20 days earlier than the full credit term would effect. 2% for 20 days is equivalent to 36% on a yearly basis.

=Showing Cash Discount in the Trading Section.=—Opinions differ among accountants as to the proper treatment of cash discounts in the profit and loss summary at the close of a period. Some maintain that the discount is a trading or selling item, and show it, therefore, in the trading section of the statement. Their theory is that discounts on sales partake somewhat of the nature of trade discounts, that the real selling price is, after all, what is received for a particular bill of goods. According to this theory, if goods

are billed at $1,000, and $980 is accepted as full settlement, the sale should be shown only at $980 on the books. At the time of offering an optional basis for settlement, however, the merchant does not know which basis the customer will accept, and he therefore enters the sale on his books at the highest offer. Later, if the customer settles on the more favorable option, the discount he takes is logically a deduction from sales.

On the other hand, if the discount is explained as a bait offered to secure customers, it should be treated as a selling cost. Consequently, on either of these two theories, cash discount would have to be shown in the trading section of the profit and loss statement, in the one case as a direct deduction from sales, in the other as a selling cost.

=Correct Method of Showing Cash Discount.=—Other accountants maintain that cash discount is a financial management item; that a manager, in order to secure ready funds with which to take advantage of the discounts offered him on his own purchases, extends to his customers sufficient inducement to secure the early and prompt payment of their bills. The difference between the saving on purchases payments and the cost of securing early payment on sales, is the measure of the efficiency of such financial policy.

While this explanation of cash discount on sales as a cost of securing funds may have some foundation, it does not give a fully satisfactory explanation of the practice. If cash discount has been correctly analyzed as being composed of the two factors, interest and bad debts expense, there can be no question as to the place of its showing. Both factors are financial items and they should therefore be placed in that section of the profit and loss statement. In this work cash discounts will be treated as a financial management item.

=Account Titles for Cash Discounts.=—In booking cash discounts, two accounts are used—one for the discounts on sales, and the other for the discounts on purchases. Self-descriptive titles are Sales Discount and Purchases Discount, which seem better than Discounts Allowed and Discounts Received and other similar titles sometimes met with.

=Methods of Booking Cash Discount.=—In booking cash discounts, any one of four methods may be used. In Chapter XIX, “The Cash Journals,” two of these methods were shown and the explanations will not be repeated here. Explanations of the other two methods follow.

1. Entry is made only in the cash book through the use of a non-cash-discount column on the receipts side. This was also fully explained and illustrated in Chapter XIX. In the illustration given there, this discount column was not used in finding the cash balance, because net cash columns were employed, thus making unnecessary the use of any other column to find the cash balance.

2. Entry is made as in method 1 above, but the discount column is used in finding the cash balance. Where, as sometimes happens, the net cash column is omitted, the true receipts can be found only by _subtracting_ the amount of the discount from the other column totals.

The closing summary for the columnar cash book, explained in Chapter XIX, shows one method of handling the discount column total. While all other summary entries for the cash receipts are _credits_, the discount summary is a _debit_. Because of this fact, the discount total is sometimes shown on the disbursements side of the cash book among the summary entries of the other columns, in which case the word “contra” is written after the words “Sales Discount,” showing that the amount has come from the discount column on the opposite page. Similarly for the Purchases Discount.

The only advantage of this method is to bring all summary debit postings on one side of the cash book and all credits on the other. Where the cash book is operated according to method 2, the closing summaries are made as shown in Form 42, using columns on the debit side for Customers, Sales Discount, and Sundry; and on the credit side for Creditors, Purchases Discount, and Sundry. As there is no net cash column, the totals for Customers and Creditors are not all cash. To clear them of their non-cash elements, the discounts can be subtracted from their respective Customers’ and Creditors’ totals, and only the net brought over into the Sundry columns; or the subtraction can be effected by adding the discounts to the opposite side. The use of a Net Cash column simplifies the summarization of the cash book and should always be employed. Treatment 2 is shown only because it is sometimes met with in practice.

=Securing Information as to Neglected Discounts.=—Some accountants have pointed out the desirability of bringing before a manager or proprietor the cost of his failure to take advantage of discounts offered him. To show this cost the following method of entering a purchase has been suggested:

Purchases 100.00 Purchases Discount 5.00 Vendor 105.00

The _net_ amount of the bill is thus charged to Purchases, the discount offered to Purchases Discount, and the Vendor is credited with the billed amount. When payment is made on any of the optional bases offered, entry is made as follows:

(1) Vendor 105.00 Cash 105.00

or

(2) Vendor 105.00 Cash 103.00 Purchases Discount 2.00

[Illustration: Form 42. Discount Columns Used for Cash Balance (Method No. 2)]

In the case of entry (1), the net result of the whole purchase transaction is a loss or expense of the amount in Purchases Discount, because of failure to take the discount. In entry (2), if the best option is taken, viz., the entire 5%, Purchases Discount shows no balance; any less favorable option, say 2%, results in a debit balance in Purchases Discount of 3%, measuring the expense incurred through failure to take the best option. Unquestionably, the information given a manager by this Purchases Discount debit balance will claim his notice and immediate attention.

A sales transaction handled on a similar basis results in a Sales Discount credit balance representing the excess of the offering of discounts over the amount taken by customers and has to be treated as income additional to the booked sales income.

Inasmuch as the sale or purchase, under this method, must be booked on a cash option basis, this treatment seems to result in a departure from true cost or in the mistake of booking only _some_ of the elements which enter into the cost of merchandise. The price at which a merchant can sell his product must include all direct and indirect costs and provide a margin for profit. The sales discount offered is simply one of these indirect costs. It cannot be more accurately estimated than can the salesman's salary which is a part of the sale price. It is inconsistent practice to separate the invoice price into two elements and term one _real_ selling price and the other sales discount cost when the _real_ selling price is still a composite item. Rather, the sale should be booked at its full invoiced price and actual costs recorded as they accrue, to be closed out against Sales Income at the end of the fiscal period.

After all, the sales policy of each concern enters largely into the determination of its normal selling price. A concern with a normal credit term of 30 days fixes its sale price on that basis; one with a 60-day credit term will, in determining its sale price, take into account the risk and interest costs of the longer credit period; and one doing a cash business will determine its sale price accordingly. However, as a means of furnishing the information necessary for guidance under a particular sales policy, sales should be recorded on the basis of the normal credit term.

To secure the information sought as to neglected discounts, it is suggested that memorandum accounts be opened for that purpose and entry be made of the expense only when incurred. Thus failure to take a purchase discount would be recorded under these or similar captions:

Neglected Purchase Discounts Reserve for Neglected Purchase Discounts

At the time the books are closed these memorandum accounts would be closed against each other, having served their purpose of giving the desired information through their inclusion in the trial balance submitted to the manager or owner.

=Trade Acceptances and Cash Discounts.=—Brief mention should perhaps be made of some recent discussions of the probable effect of the extended use of trade acceptances on the practice of allowing cash discounts. Some sellers, to whom the cash discount practice is troublesome and unsatisfactory, welcome the use of trade acceptances as an avenue of escape from the practice. Others have gone so far as to say that the trade acceptance will eventually do away with cash discounts. It should be said that the use of trade acceptances, while attractive from the seller's standpoint, has not as yet made a strong appeal to buyers, largely because of the fact that it offers little that the open account method does not secure for them and it may, on the other hand, interfere somewhat with the taking of cash discounts.

CHAPTER XLV

BALANCE SHEET VALUATION

=The Two Problems of the Balance Sheet.=—There are two major problems connected with the balance sheet: (1) the problem of form, and (2) the problem of content. The form of the balance sheet, which was discussed rather fully in Chapter III, has to do with the arrangement of the items for the purpose of intelligent reading. It deals with the principles in accordance with which the asset, liability, and net worth items are to be marshaled and set up in groups and arranged within the group with a view to facilitating the comparisons between groups and the calculations made in judging the financial condition of the concern.

The second problem of the balance sheet, that of content, which was also mentioned in Chapter III, concerns itself mainly with the valuation of the items in the balance sheet, assuming of course that all the assets and liabilities are included in the statement. A balance sheet may be correct in form but, unless its content is reliable, it has little or no value when judged from the standpoint of its chief purpose, namely, that of showing the financial condition of the concern. The problem of the form of the balance sheet has to do with the technical or mechanical side of accounting, while the problem of its content or the valuation of its items has to do with the questions of the concern's financial administration, for the solution of which the accounting department must furnish in proper form the necessary information.

=Kinds of Value.=—It is first necessary to state the limitations within which the principles of valuation to be laid down are applicable to the commercial balance sheet. In business many different kinds of value are found and used. Thus we have the terms, sale or liquidation value, cost value, and replacement value. By the term "sale value," when applied to a going business, is meant the value which a willing buyer offers to a willing seller. "Liquidation value" means the value or price offered for a commodity or an entire business when the concern is winding up its affairs and going out of business. Liquidation is, therefore, forced value. There is thus a marked difference between sale value and liquidation value. The term "cost value" is understood to mean the price paid for a purchased article. From the discussion of the principles of debit and credit as applied to merchandise and to fixed assets, it has been shown that the price paid should include not alone the invoice cost but the other expenditures needed to put the article purchased in such a position that it can be used by the business in the customary way. Replacement value means the cost to replace an article. It differs from first cost mainly in that the price level may have changed between the date of the original purchase and the present time. Thus, because of the changes in prices, an article, costing $1,000 in 1914, might have had a replacement cost of $1,800 in 1917, and $1,400 in 1922.

Manifestly, before the principles to be followed in valuing balance sheet items can be laid down, there must be some understanding as to what kind of value is under discussion. The kind of value used in the ordinary commercial balance sheet is termed "going concern value." By this is meant the value which is applied to a going business—a business which expects to continue in operation, not one which expects to sell out to other owners nor one which expects to discontinue operations.

=Source of Data as to Values.=—In a going concern the information as to value is found chiefly in the books of account. The data in the accounting records are, of course, supported by the original documents evidencing the purchases and sales. It is a necessary corollary that if the books of account are to give reliable information as to values, a correct analysis must be made of all transactions previous to their entry. Mention was made in an earlier chapter of the necessity of a clear differentiation between capital and revenue charges and the effect of failure to make such differentiation. If at the time of an expenditure a correct classification of accounts has been made, particularly of the broad classes of assets, liabilities, and proprietorship, the accounts should reflect the true values as of the various dates of record. For purposes of detailed information it is equally necessary that a correct classification be made of the accounts affected by an entry within any of these main groups. It has been seen that because of practical difficulties no effort is made to have the accounts reflect day by day the correct value of the various items. It is considered sufficient to bring the book record into agreement with the facts in respect to value once each fiscal period, namely, at its close. The true financial condition and correct operating results are then determined.

It will thus be seen that a correct analysis of every transaction recorded in the accounts is an absolute prerequisite to the use of the accounts for determining correct values. It is very vital that a clear line of demarcation be maintained between capital and revenue expenditures—that great care be exercised that no cost is charged into the asset group of accounts unless such cost really enhances the worth of an asset. A cost incurred for the purpose of maintaining the value of the asset is an expense charge, and repairs and maintenance charges must be very carefully distinguished from replacements. _Maintenance_ has to do with those costs which maintain an asset in good operating condition; _repairs_ have to do with those costs necessary to put an asset in operating condition after a condition of inefficiency has been reached which the maintenance costs have not been able to prevent; a _replacement_ cost is incurred when it becomes necessary to replace some part or the whole of an asset, neither maintenance cost nor repair costs having been able to maintain the asset in efficient operating condition. Where only a part of an asset is to be replaced, it is often spoken of as a _renewal_ of parts. When so used, the term "replacement" is limited to the renewal or the

replacement of the whole asset.

When a renewal or replacement is made, it becomes necessary to determine whether the cost of the renewal or replacement is more than the cost of the part or the whole replaced. For example, if an asset costing originally $1,000 is replaced by one costing $1,200, there has manifestly been an addition of $200 to the value of the asset. The new asset may be an exact duplicate of the old but if prices have risen so that the new actually costs more than the old, the books must record the asset at its new cost value. The amount by which a new asset or part of an asset exceeds the cost of the old asset or old part is called a _betterment_. A betterment is always an asset.

The student will readily see that at times it must be difficult to draw the line between repairs and replacements. In practice the line is usually drawn only when the expenditure exceeds a certain amount. This amount is not uniform and is determined by each individual business. For example, when the cost of placing the asset in efficient condition for operation is less than, say, $100, it is charged as repair cost and therefore does not increase the book value of the asset. If the cost exceeds $100, an analysis is made to determine what portion of it, if any, increases the value of the asset. The amount of the betterment is of course a charge to the asset account, while the rest of it is a charge to some expense account.

=Treatment of Special Items.=—In the determination of the classification of charges, some kinds of items require special consideration:

ORGANIZATION EXPENSE. The group of expenditures explained in Chapter XXXVIII, as incident to the organization of a corporation, is recorded under the title “Organization Expenses” and is classified for purposes of the balance sheet as an asset. It is a kind of asset, however, which has no tangible value and most businesses desire to consider it more in the nature of a deferred charge to operations. It is recognized that frequently intangible assets add no strength to the business. While, therefore, in strict theory organization expenses are assets, in practice it is best to write them off against income during a period of from three to five years.

COST-CUTTING CHANGES. Another similar class of charges is met in costs incurred in making changes in the arrangement of building and other facilities which will tend to bring about a more economical handling of some phases of the business; for example, a rearrangement of a receiving and packing room in order to facilitate the receipt and delivery of goods. Where these costs are inconsiderable it is best to charge them against the income of the period in which they are incurred. Where, however, a big expenditure is necessary, it seems best to set the costs up under a suitable descriptive title and spread them over several periods. In other words, at the date of their incurrence the costs are treated as an asset whose value is to be written down at the end of successive fiscal periods until finally it has all been charged against the operations of the business.

INTEREST DURING CONSTRUCTION PERIOD. Where a business builds its own home, all costs incurred during the period of construction are proper charges to the costs of the construction. Thus, if a mortgage or bond issue is used as a means of partially financing construction of the building, the interest paid to the mortgagee or bondholders during the period of construction is a proper charge to the building account. Costs of this kind follow the general principle laid down previously, that all costs up to the point of placing the asset in condition ready for use are proper charges to the asset.

=Basic Rules for Valuation of Balance Sheet Groups.=—We may now consider the principles applicable to the valuation of the various groups on the balance sheet. In the standard form of balance sheet the assets are divided into the three groups: (1) Current, (2) Deferred Charges, and (3) Fixed.

It has been seen that the assets of the current group are used for purposes of settling debts, the payment of expenses, and the purchase of merchandise. In judging the sufficiency of these assets for this purpose, it is absolutely essential to know that the values at which they are carried will be realized when they are converted into cash. From the standpoint of conservative business management an understatement of realizable value may be made, but never an overstatement. Accordingly, the fundamental principle of valuation applicable to this group is that these assets are to be valued at cost or market, whichever is the lower. When so valued, the figures at which they are carried in the balance sheet will usually represent an amount slightly less than the amount which it is expected will be realized from their conversion into cash.

The function of the deferred charges group of assets is to secure an equitable distribution of expense charges between the current and the following period. It is only because certain expenditures have been made during the current period which will benefit the succeeding period, that it is necessary to set up this group of assets. Here the problem of valuation is, therefore, simply the

problem of dividing the cost of the expenditures between the current and the next period on the basis of the benefits accruing to each. In some cases the basis of division is one of time, as where an insurance policy is purchased for a definite term. The portion of the policy which has expired during the current period is the portion of its cost to be charged to the current period, the balance being deferred to succeeding periods and therefore carried as an asset. In other cases a physical inventory is necessary to determine the distribution of the cost of expenditures, as when supplies of fuel have been purchased and not entirely consumed during the current period. The basis of the value carried over to the next period is of course a fair portion of the original cost. Market or replacement cost does not have any effect on the valuation of the deferred portion.

Fixed assets are acquired as more or less permanent equipment without which it is impossible to operate the business. The time during which an asset continues in use is the customary basis for a classification of its cost as between expenses and fixed assets. Thus, an asset acquired for purposes of business operation which, however, will be used up completely during the current period is charged immediately to some expense account, whereas an asset which will continue in use over several periods is charged to an asset account. Fixed asset purchases are never for purposes of resale. It is expected that they will continue in use until they are discarded because of failure to perform the service for which they were acquired. Neither the sale value nor the replacement cost value of such assets has, therefore, any influence on their value to the business. That value is the full cost adjusted periodically by an equitable distribution of that cost over the operations of the periods benefited by the services rendered by the asset. This principle of valuation is usually expressed by the formula, cost less depreciation.

=Valuation of Assets=

CASH. Cash as carried on the balance sheet is the asset which is used, without conversion, for payment of the liabilities of the business. There should, therefore, ordinarily be no problem of valuation. However, because of the practice of including checks, drafts and notes due and in course of collection, cash balances held abroad and therefore subject to the fluctuations of exchange, and other similar items in the account Cash, it is oftentimes necessary to examine all these items carefully and arrive at a figure which represents the amount expected to be realized from them.

NOTES AND ACCOUNTS RECEIVABLE. The claims against customers, both on note and open accounts, constitute an intermediate step in the conversion of merchandise into cash. At the time credit is extended to a customer it is expected that he will pay the amount due. The experience of every business man shows, however, that during each period there is a shrinkage in these claims due to some customers failing to pay the amounts they owe. In valuing these claims it is therefore necessary to take cognizance of the amount of the shrinkage. This amount is different in different businesses, depending on the length of the credit term, the policy as to investigation of credit risks, and on the rigor of the collections policy. On the basis of the experience within a given business, it is therefore necessary to make an estimate of the loss from uncollectible accounts.

The manner of making the record of estimated bad debts has already been explained. The reason for placing the amount by which the asset is estimated to shrink as a credit in the Reserve for Doubtful Accounts account rather than in the Accounts Receivable account has also been explained. The custom of estimating the amount of loss on the basis of the sales for the period rather than on the amount of claims outstanding at the close of the fiscal period has been referred to. Here it is desired to explain the manner of handling the reserve at the time claims are definitely determined uncollectible. Until a claim is determined uncollectible it is carried as a part of the assets, Notes or Accounts Receivable. The amount of the estimated shrinkage in these assets due to failure to collect claims is indicated by the Reserve for Doubtful Accounts account. This amount cannot be applied directly to particular notes and accounts until it is definitely known that such notes and accounts cannot be collected. When that is learned, it is necessary to transfer from the reserve account the amount needed to cancel from the books the uncollectible notes and accounts receivable. This is done by the following entry:

Reserve for Doubtful Accounts Notes (and Accounts) Receivable

PROBLEM. Assume that the accounts receivable amount to $75,000, of which it is estimated that $5,000 will not be collectible. During the succeeding period a customer owing $500 becomes bankrupt and nothing is realized on his account.

The accounts will then appear as follows:

ACCOUNTS RECEIVABLE ========== Dec. 31 75,000.00 | Feb. 28 500.00

RESERVE FOR DOUBTFUL ACCOUNTS ========== Feb. 28 500.00 | Dec. 31 5,000.00

It will thus be seen that the decrease in value of the accounts receivable as estimated by the amount in the Reserve for Doubtful Accounts can never be applied to the asset until it is definitely determined what particular customer's account included in the Accounts Receivable account is bad and must therefore be written off the books. Inasmuch as the Bad Debts account set up at the close of each fiscal period to indicate the loss or expense due to uncollectible accounts, has been charged as an expense of operating for that period, it would manifestly be duplicating the expense charge if a debt that proved bad were charged to the Bad Debts account rather than to the Reserve for Doubtful Accounts. Only during the first period of operation of a business are debts, if determined bad during that period, charged to the Bad Debts account. Even here, if it is expected at the close of the first period to base the estimate of uncollectible accounts on the sales for the period rather than on the amount of outstanding accounts at the end of the period, it would be necessary to charge the debts becoming bad during the period against the Reserve for Doubtful Accounts account—even though at the time of the charge it contained no credit entries—and not to the Bad Debts account. The desirability of establishing a standard routine for the handling of all items should be kept in mind. Best practice, therefore, demands that all debts shall be charged against the Reserve for Doubtful Accounts whenever they are determined to be bad, regardless of the amount held in reserve in that account. If such practice creates a debit balance in the Reserve for Doubtful Accounts, it is an indication that the estimate of uncollectible accounts made in previous periods has not, as a matter of fact, been sufficient and a larger estimate must be made for future periods.

MERCHANDISE. Merchandise is purchased for the purpose of resale at a profit. Sale price is dependent, in a free market, on the force of demand and supply and not at any given time on cost. Until the goods are sold no profit, as a matter of fact, has been secured. Conservatism, therefore, demands that sale price should not ordinarily be used as the basis for the inventory valuation. Unless there has been a decided change in prices, it is the confident expectation of the management that at least the cost price of the merchandise will be realized when the goods are sold. Ordinarily, therefore, merchandise will be priced in the balance sheet at cost. When, however, there has been a change in price levels, particularly when the indication is that there is a generally declining market and not simply a temporary fluctuation in prices, it is the part of conservatism to value the merchandise at its replacement cost, or even at a lower figure, if stocks are large and market conditions are such that customers are withholding their purchases until price levels have dropped still further. The basic principle for valuing all current assets requires that they be valued as nearly as possible at the realization figure. Therefore, the amount expected to be realized governs or influences the valuation basis. The valuation formula or rule-of-thumb method, in accordance with which merchandise inventory is usually valued, is expressed as cost or market, whichever is the lower. As indicated above, there are times when exception is taken to this basis.

INVESTMENTS. Stocks and bonds representing the investment of temporary surpluses of cash are valued on a realization basis. Inasmuch as the tying up of cash in these securities is only temporary and it is expected that they will be converted again into cash as needed, the amount which can be realized from their sale on the date of the balance sheet is the amount to be considered when judging the financial condition on that date. A large amount of discretion must be used in valuing these securities, because of the violent fluctuations to which quotations on the various stock exchanges are subject. Here also conservatism does not usually authorize value at the market if the market is higher than the cost. Accordingly, the valuation formula is cost or market, whichever is the lower.

ACCRUED INCOME. The income accrued on the date of the balance sheet is determined on the basis of a fair distribution between the periods during which the income accrues. Thus, the income from money loaned during the current period but not due until a succeeding period must be distributed over two or more periods. Where the income is dependent on time, the portion applicable to the current period is determined on a time basis. Where the income is dependent on some other basis, such as sales or units of work done, the portion applicable to the current period is determined by the ratio of the whole to the amount completed during the present period. Thus, in the case of a contract entered into to sell goods on a commission basis, the commission income accrued during the current period will usually be based on the amount of sales made during that period.

DEFERRED CHARGES. The valuation principle for deferred charges has been stated above in connection with the principles of valuation to be applied to the various groups of accounts on the balance sheet.

FIXED ASSETS. Fixed assets may usually be divided into two classes: (1) assets not subject to depreciation, and (2) assets subject to depreciation. The usual example of assets not subject to depreciation is the land on which a building stands. Land used for growing crops may easily be subject to depreciation. Land subject to the exploitation of the natural resources under its surface is

similarly subject to depreciation. To distinguish the decrease in value of such natural resources because of the fact that they enter into and become a part of the commodity dealt in, the term “depletion” is used. Thus, a coal mine or oil well decreases in value with every unit of product taken therefrom. It is not purposed hero to discuss the principles of valuation applicable in such cases, the assets under discussion being limited in meaning to those of a mercantile business. (See Volume II, page 312, for a discussion of depletion.)

The valuation formula for assets not subject to depreciation is cost. Increase in value due to changed market conditions is not usually to be taken account of.

The second group of assets, those subject to depreciation, are to be valued on the basis of original cost less the amount of depreciation accrued to the date of the balance sheet. The valuation of such assets, therefore, requires the determination of the amount of depreciation.

Depreciation arises from several causes, the chief of which are:

1. Wear and tear, due to use. 2. Decrepitude or age, due to lapse of time. 3. Obsolescence, due to a changed demand for the article or to an advance in the arts which makes the continued use of the asset uneconomical. 4. Inadequacy, brought about by several causes, one of which may be the change in the market which renders the asset inadequate for furnishing the product or service in the amount required.

Obsolescence and inadequacy, because of their very nature, are usually difficult of determination and frequently cannot therefore be considered in determining the amount of depreciation accrued at a given time. Where measurable they should, of course, be taken into account. Depreciation due to lapse of time is calculable on a time basis. Depreciation due to wear and tear is calculable on the basis of the use to which the asset has been subjected. It is in practice difficult to separate these two types of depreciation. The estimate for depreciation is in the majority of cases made on a time basis. In manufacturing establishments, oftentimes a use or output basis proves more satisfactory. These more difficult problems met in the determination of depreciation are discussed in Volume II. Here only the most usual method of depreciation estimate on a time basis, known as the straight-line method, will be explained.

For determining the periodic amount of depreciation of any asset it is necessary to know: (1) the original cost of the asset; (2) its scrap value, that is, the estimated value as scrap on the day it is junked; and (3) the estimated life of the asset in years or fiscal periods. The following symbols will be used in working out the formula:

_V■_ = Original value. _V■_ = Scrap value at the end of _n_ years, its estimated life. _n_ = The estimated number of years in the life of the asset. _D_ = The amount of depreciation during a period. _r_ = The rate to be applied to _V■_ in order to determine _D_.

It is apparent that _V■_-_V■_ is the amount to be depreciated over the life of the asset. The amount to be charged off periodically as depreciation is, therefore:

(_V■_ - _V■_) ---------- _n_

Accordingly

_V■_ - _V■_ _D_ = ---------- (1) _n_

The amount to be written off each year is thus seen to be constant. The percentage to be applied to the original cost in order to determine the periodic depreciation _D_ is, therefore, found by dividing _D_ by _V■_. Hence the formula:

_D_ _r_ = ---- (2) _V■_

Having determined by careful estimate the method of calculating the periodic amount of depreciation, the problem of valuation of the asset at any given time during its life is ordinarily simple. In the case of renewal of any parts, the question of betterment comes in and requires careful handling. In unusual cases it may often be necessary to revise the rate of depreciation in order to write off the betterment during the remaining life of the asset. Depreciation is at the best but an estimate and unless there are major betterment items it is not usually necessary because of them to revise the estimate of depreciation. When a renewal takes place it is theoretically necessary to determine the value of the replaced part at the time of its replacement. The excess of the cost of the new part over this value is the amount of the betterment, when only the values of the old and new parts are considered. In such cases, however, the new part will not usually have value apart from the asset to which it is attached. In practice, therefore, the

amount of the betterment recorded is the difference between original—not present—value of the old part and the cost of the new part. An example will illustrate the problems involved and the accounting treatment.

PROBLEM. Assume that an asset—office equipment—costing $1,000 has an estimated life of ten years and no scrap value. After six years of this life it becomes necessary to replace a part of the asset, estimated to have cost originally $100, the cost of the new part being $150. At the time of the replacement the depreciation reserve carries an amount of $600.

The first step in booking the transaction is to transfer from the reserve account to the asset account the original cost of the part replaced. Just as in the case of bad debts, now that a part of the asset has been discarded and the amount of the decrease in value of the asset is definitely known, this amount held in suspense until the present time in the reserve account must be applied as a definite reduction in the carrying value of the asset. The entry to effect the transfer is:

Depreciation Reserve, Office Appliances 100.00 Office Appliances 100.00

The next step is to set up the cost of the new part which replaces that discarded. This follows the usual entry at the time of purchase of any equipment. The entry needed is:

Office Appliances 150.00 Cash 150.00

The student will note that the office appliances account now carries a value of $1,050, of which the $50 represents the value of the betterment.

It might appear that since the renewal occurs at the end of six years there has been accumulated in the reserve by that time only $60 covering this specific part, and that therefore only $60 should be transferred from the reserve account, the other $40 being charged to a proprietorship account to represent the additional expense or loss not yet provided for by the depreciation charges during the past six years. That is not the situation, however, for if the periodic depreciation has been correctly estimated, the entire amount, $100, has already been charged off and is therefore included in the reserve. When the asset was originally installed and the length of its life estimated for the purpose of determining the periodic depreciation charge, the policy as to repairs and renewal of parts was taken into consideration. Such estimates cannot, of course, be absolutely accurate. However, until such time as a definite basis is given on which to check the amount of the over-or under-estimate, it is the standard practice to charge against the reserve the original value of the renewed part. Always at the time of discard of the entire asset—and sometimes sooner—such a definite basis is given and adjustment must be made in accordance with the facts then ascertained. A problem will illustrate the considerations involved.

Continuing the foregoing example, assume that the office appliance, now valued at $1,050 with a reserve of $500, is discarded after ten and a half years' service.

At the end of the tenth year the annual depreciation charge of $105 will have brought the reserve account to a total of $920. Six months later, at the time of discard of the asset, there will be accrued depreciation, not yet booked, amounting to $52.50. It is, accordingly, necessary to book this amount by means of the following entry:

Depreciation 52.50 Depreciation Reserve Office Appliances 52.50

This entry charges the current period with its share of the consumed value of the asset. The next step is to transfer the reserve account to the asset account, to show in that account the amount of the inaccuracy in the depreciation estimate—the amount by which the actual depreciation differs from the estimate. The entry is:

Depreciation Reserve Office Appliances 972.50 Office Appliances 972.50

The office appliance account now shows a debit balance of $77.50, which indicates the value or amount of the asset which has been consumed but which has not been charged against the income of the periods during which the asset was used. It is manifestly inequitable to charge this amount against the income of the six months of the current period, and it is impossible to go back and spread it over the previous periods because their records have been closed. The charge must therefore be made direct to the Surplus account in the case of a corporation, or to a final section for extraordinary profits and losses of the regular Profit and Loss account in other cases. It may be handled by this latter method also in the case of a corporation. The entry needed is, therefore:

Surplus 77.50 Office Appliances 77.50

In case the reserve is more than the value of the asset at the time of discard, it means that more than the cost of the asset has been charged as expense. Accordingly, the excess represents real profit and must be transferred to surplus. The necessary entry is:

Office Appliances Surplus

GOOD-WILL. Good-will is an intangible asset depending for its value upon the ability of a business to make more than normal profits. It is not usual for a business to show an asset of good-will unless it has purchased another business and has paid for the latter's good-will. In other words, good-will is not brought on to the books until a purchase determines its market value. Where good-will is purchased, it is customary to carry it at its cost value. Depreciation is not taken into account. Because of the intangible nature of good-will and its more or less speculative value, some businesses prefer not to show it. In such cases it may be written off against surplus at any time and in any amount until it has all disappeared from the books. While, therefore, good-will is not subject to depreciation, it is subject to this writing off process, which usually bears little or no relationship to time. It should not be charged against the profit of any period or several periods, but when written off should be charged direct against surplus.

=Liabilities.=—The problem of valuation of liabilities is simple. From the standpoint of a going concern, its liabilities decrease only when they are paid off, and increase only because of services or assets purchased and not paid for. The main problem in connection with balance sheet liabilities is the determination of the fact that all liabilities are shown on the balance sheet. This oftentimes involves the consideration of contingent liabilities. The amount of a liability may sometimes be in dispute, in which case a careful and conservative estimate of the probable amount must be made and shown.

=Proprietorship.=—Since proprietorship is always the difference between assets and liabilities, the problems of valuation of proprietorship are solved almost automatically if the valuation of assets and liabilities have been handled properly. There may sometimes be problems in connection with the various items in the proprietorship group. These concern surplus, undivided profits, and various reserves. The problems here are largely those of determining whether a company has lived up to its contract or other agreements in the maintenance of the proper values in the various proprietorship accounts.

=Conclusion.=—The problems of valuation are vital to any business and intimately concern its financial integrity. In order to maintain at least the original capital investment in a business, it is necessary to make provision for the decrease in asset values due to different causes. The financial management of the business must watch this feature closely, else capital will be dissipated and the business rendered incapable of performing the functions for which it was organized.

CHAPTER XLVI

BUYING AND STOCK CONTROL

=Importance of Buying.=—Buying as a major function in a mercantile concern is intimately related to, and dependent on, the other functions of the business. Buying must always have regard to the sales activities. To buy without reference to the ability to sell is suicidal. Both overbuying—buying more than can be disposed of at a profit—and underbuying—buying less than is needed to meet the sales demand—are conditions to be avoided. Underbuying means a loss of sales. Unless their needs are met promptly in accordance with their orders, customers will go elsewhere. Overbuying means the unnecessary tying up of capital in a stock of goods which increases the possibilities of loss resulting from changes in fashions and the level of prices. The relation of the rate of turnover to profits in merchandising was discussed in Chapter VII. Manifestly the ideal situation, so far as the amount of stock carried is concerned, is one in which the least amount of capital is used to provide an adequate stock for meeting the requirements of customers and in which the loss from unsalable stock is reduced to the lowest level.

Many business houses fail to realize the wastes resulting from slow turnovers. The Chamber of Commerce of the United States has called attention to these losses and has analyzed them under the following heads:

1. The unnecessary use of capital in merchandise that could be more profitably employed in other productive sources.

2. The increased cost of borrowed capital, the carrying of larger stocks and their slow turnover, necessitating the borrowing of larger amounts of capital for longer periods.

3. The marking down of the sale price due to the fact that the goods will not move at the higher sale price.

4. An increase in overhead expenses due to the larger storage and display equipment needed for goods and to the costs incident to handling the larger stock, and re-marking the stock when it is necessary to lower sale prices.

5. The loss of prestige and reputation from carrying unstylish and shopworn goods.

=Relation between Buying and Finance.=—From what has already been said, it is evident that there is a very necessary relation between the buying policy of a business and its ability to finance purchases. Even though it may be possible to increase sales, unless the business is in a position to finance not only the additional credits extended to customers but also the additional purchases needed to take care of the increased sales, it will not be feasible to pursue a policy of sales expansion and therefore of increased buying. Hence, buying cannot be considered as a business activity by itself, but as one dependent upon the sales activities and the financial resources of the business.

=Organization for Buying.=—In large merchandising businesses the duties and authority of the buying department are not uniform. In some, this department is organized entirely distinct from the selling department; in others (and this is particularly true of the large department stores), the buyer is head merchandise man with control over the selling activities of the business. It is also quite usual for the buyer to be in charge of a given department and his success or failure to be judged by the profits he makes in that department. A profit quota is sometimes assigned to each department, for which the buyer is responsible. In other words, in the management of the buying and selling activities and therefore in the control of his merchandise stock the buyer is supreme, subject to the general limitations placed by the financial resources at his disposal. Under the control of the buyer, therefore, will be stock clerks, the clerks which mark and re-mark the merchandise, and the sales force. Above and in control of all the departmental buyers is usually an executive or high official of the company whose chief function is to correlate the activities of the buyers with the concern's general buying, selling, and financial policy.

=Characteristics of the Buyer.=—To perform his functions properly, the buyer must be a man of broad experience, with a keen sense of values and the marketing possibilities of merchandise. On the buying side he must have complete information as to the available sources of the merchandise he desires to secure, both in staple and in novelty lines. On the selling side he must know the demands of his customers and the possibility of creating new demands. The best index of the buying power of his customers is the volume of sales made in previous years. Past performance, considered in connection with general trade conditions and plans for the further development of the business, is the only basis for judging the sales possibilities of the future. He must know the quality of merchandise and the reliability of the people from whom he buys. He must be a keen judge of prices. He must know the financial resources of his own store and strive to secure the best possible credit and discount terms.

=Buying Procedure.=—In Chapter XXII, where the goods invoice was discussed, a typical purchasing procedure was set forth. Here only the chief points in that procedure will be mentioned. In a large establishment the buying requisition should be the basis of all purchase orders. This is particularly true when the buyer does the buying for several departments. The requisition should be made out in triplicate by the department head, two copies going to the buyer and one being retained in the department. Upon the issuance of the buying order, the second copy of the requisition is returned to the department as evidence that the goods have been ordered.

The purchase orders are made in manifold, the original going to the vendor, one copy to the treasurer to notify him of the future need for funds, one to the controller or accounting department, and one being retained by the buyer as a basis for follow-up. Upon receipt of the invoice, which usually precedes the goods, the buyer compares it with the order and if it is found correct, he passes it to the accounting department, where it is held until the receiving slip, showing the receipt of goods, is received from the receiving room. If the three documents now in possession of the accounting department, namely, the copy of the original order, the invoice, and the receiving slip, agree, the invoice is passed for entry on the books and is filed for payment in accordance with the financial policy of the business. After payment, the invoice with its supporting documents is filed. Great care must be exercised to make sure that an invoice is not put through more than once for payment and that every invoice represents goods properly ordered and actually received.

=Requirements of Successful Buying.=—Successful buying rests on a knowledge of two things: (1) when to buy, and (2) what to buy. The timeliness of buying has regard rather to the sales requirements than the market possibilities. Goods are bought for the purpose of satisfying needs of customers. A knowledge of the trend of the market is necessary but buying wholly in accordance with market trends too often leads to speculation in merchandise, due weight not being given to the sales requirements. A knowledge of the specific commodities needed to satisfy the requirements of customers is equally important. The regular use of the

“want slips” of customers calling for goods not in stock is one source of information. The records of the paid “shoppers” as to the commodities and prices of competitors is also some indication.

In answering both these questions, when to buy and what to buy, the records of the business itself should furnish the fundamental information needed to secure a proper control of the movement of merchandise. Some system of perpetual inventory is almost indispensable. In a small business where the buyer, usually the owner, is in intimate contact with all departments, a fairly satisfactory control of merchandise can be secured without a perpetual inventory. In a business of some size, however, the perpetual inventory is an almost absolute essential if movement of stock is to be kept under control.

=Control of Merchandise Movement.=—The beginning of merchandise control is the fixing of the sales quota, that is, the making of an estimate of sales for the next period. Without a definite goal to be aimed at control is impossible. Buying and finance are dependent on it. A knowledge of the stock on hand at any time is needed to determine the buying requirements. Even in a small business the inventory can at least be estimated on the basis of past performance as to percentage of gross profit and therefore the percentage of cost of goods sold. The application of this figure of percentage of cost of goods sold to the sales for the period gives the cost of goods sold, which, subtracted from the opening inventory plus goods purchased, gives an estimate of the goods in stock. A perpetual inventory kept by quantities rather than by values serves the purpose in many establishments. What is known as the “retail system,” by means of which the value of the stock on hand can be estimated at any time, is used in many large retail establishments. In addition to, and in conjunction with such a system, the use of commodity control cards, as illustrated in Form 43, gives a sure index of the condition of stock and the movement of merchandise at any time.

=The Retail Method of Inventory.=—The retail system of inventory is based on the carrying of all goods purchased at a retail sale price as well as at cost price. In the financial records purchases are, of course, always booked at cost. A stock record is kept, however, which carries purchases at retail sale price as well as at cost price. The principle of the perpetual inventory under this method is shown by the fundamental formula:

Opening Inventory + Purchases - Cost of Goods Sold = Final Inventory

It is apparent that if all the values on the left side of the equation are retail sale values, the right side of the equation represents the final inventory valued at the retail sale price. Thus, if the opening inventory for use in the stock record is set up at the marked sale price, and purchases are similarly set up, the subtraction of the sales to date from the sum of the opening inventory and purchases gives the amount of stock on hand valued at the sale price.

In order to reduce an inventory, valued at retail sale price, to a cost basis, the per cent of mark-on of the cost price to give the original sale price must be applied. This per cent is based on the sale price and not the cost price, being determined by dividing the difference between sale and cost price (that is, the gross profit figure) by the sale price. Thus, a commodity, costing $60 and marked to sell at $100, will, if sold, yield a gross profit of $40, which, given in terms of the sale price, is a 40% gross profit. This 40% is spoken of as the “mark-on per cent.” The cost is, therefore, the difference between 100% and the per cent of mark-on, in this case 60%. That is, 60% of the sale price gives the cost price.

Accordingly, to reduce the inventory value at selling price to a cost price basis, it must be multiplied by 100% minus the per cent of mark-on.

The use of the retail method is thus seen to require a stock record from which the goods on hand as valued at selling price can be determined almost instantly and from which the per cent of mark-on can also be determined. In principle the method is simple. In practice it must be operated very carefully, else unreliable results will be secured. It seldom happens that merchandise will always move at the marked sale price. Adjustments are necessary. On an upward market, perhaps, a higher price can be secured than the marked price. On a downward market or in order to move certain colors and styles, it is necessary to mark down from the original sale price. The fluctuations arising from mark-ups and mark-downs are treated in Chapter XI of Volume III and will not be discussed here. Some applications of the retail method will be explained, however.

=Some Buying Records and Their Use.=—The chief purpose of the main records kept in business is the securing of control over the activities of the business. The control over merchandise must always be based on records. The first step in securing the necessary control is a proper departmentization of stock. Analysis of purchases and sales by departments is fundamental. In addition, a knowledge of what others in the same line are doing serves as a criterion by which to judge one’s own results. Trade associations and research bureaus are giving invaluable information by furnishing standards for judging results.

Three major problems from the buyer's standpoint are always met. They are not independent problems but, as indicated above, are intimately related to selling and financial policies. These problems are: (1) the determination of the average stock to be carried; (2) the determination of the buying quota for a given period; and (3) the determination of the "open-to-buy" amount at a given time. Too often these matters are decided in a haphazard fashion. Only by means of a careful analysis of all the factors and the results obtained in the various departments as compared with average or standard results can a sound basis of stock control be secured.

=Average Stock to be Carried.=—Stock control rests, in the first place, on estimated requirements for the future. Estimates for the future must always be based on past performance, as modified by present market conditions and contemplated changes in basic merchandising policies. In estimating the amount of stock to be carried, the volume of expected sales must be taken into account. The other factor is the rate at which the merchandise should turn during the period. Thus, if estimates are made for a period of six months, the estimated sales for the period divided by the number of times the stock is expected to turn during the six months will give the average amount of stock to be kept on hand. Seasonal fluctuations must be taken cognizance of in determining the changes from average stocks to be carried at particular times during the period. Thus, if the estimated sales in a given department are $50,000 for the next six months and the merchandise turns twice during that time, manifestly a stock of $25,000, as priced at retail, must be carried. If the mark-on is 40%, the cost of the average stock will be 60% of $25,000, or $15,000, representing the average capital to be tied up in stock for that department.

=The Buying Quota.=—The determination of a buying quota for a given period must take cognizance of the stock on hand at the beginning of the period, the stock which it is planned to have on hand at the end of the period, and the estimated sales for the period. If, from the sum of the stock planned to be on hand at the end of the period and the sales estimate for the period is subtracted the stock on hand at the beginning of the period, the buying quota for the period is determined. This buying quota is, of course, at retail price and must be reduced by use of the mark-on percentage to a cost basis. An illustration will show the method:

Stock planned to be on hand at end of period $25,000 Estimated sales for period 50,000 ------- $75,000 Stock on hand at beginning of period 23,000 ------- Buying quota at retail price $52,000 ------- Mark-on is 40%, i.e., cost is 60% of selling price. Therefore $31,200 = buying quota at cost

=The "Open-to-Buy" Estimate.=—The buying quota is estimated at the beginning of the period. At various times throughout the period, if stock is to be properly controlled, it is necessary to know how much of the buying quota is available. Furthermore, because estimates made at the beginning of the period never quite coincide with the facts of actual performance, it is necessary to take cognizance of these data of performance in determining the amount of stock to be bought at a given time. The difference between the estimated sales for the period and the actual sales to date is the estimated sales to be made during the remainder of the period. If from the stock on hand at a given date is subtracted the estimated sales for the rest of the period, the difference will be the estimated stock remaining on hand at the end of the period, providing no more purchases are made. If this amount is less than the amount of stock planned to be on hand at the end of the period, the department is "open-to-buy" to the amount of the difference. If the estimated amount on hand at the end of the period is more than the planned inventory for the end of the period, no additional stock should be purchased, except of course to replenish certain stocks which have become depleted and which it is necessary to have on hand to meet the needs of customers. In calculating the stock on hand at a given time, cognizance must be taken of stock in the warehouse, in transit, and on order. A typical open-to-buy calculation is shown below:

Stock on hand today $ 40,000.00 Stock in warehouse 15,000.00 Stock in transit 10,000.00 Stock ordered (to be received before end of period) 25,000.00 ---------- Total available stock $90,000.00

Sales planned for period $175,000.00 Sales made to date 105,000.00 ---------- Estimated sales for balance of the period 70,000.00 ---------- Estimated stock at end of the period $20,000.00 Planned stock at end of the period 30,000.00 ---------- Open-to-buy amount $10,000.00 ==========

This open-to-buy figure should be amended in the light of experience with regard to the way in which actual sales are running as compared with the estimated sales. If it is apparent that the sales are running ahead of the estimate, the sales quota should be enlarged accordingly, which will in turn increase the open-to-buy balance. A similar adjustment should be made in the event that actual sales are not keeping pace with the estimated quota.

=The Stock Control Card.=—The problem of stock control is not solved solely by a maintenance of buying quotas and limits. The movement of individual commodities must be watched very closely. The tying up of funds in large stocks of slow moving commodities may soon use up the buying quota needed for faster moving commodities. To maintain control over the movement of

individual commodities, a record called the “stock control card,” which is similar to the stock book, is of great value in some lines. To other lines it will not be found adaptable. It is not the purpose of this chapter to attempt to lay down specific methods adaptable to all situations but only to discuss basic principles and to illustrate them by methods found applicable to certain situations. The control card illustrated in Form 43 is one used in a retail shoe store.

On the form shown as Form 43, Style, Bought From, Description, and Material, are self-explanatory. On the line below, cost is shown in the first column, size in the next, and the month with days along the rest of the line follows. Horizontally are entered on the dates shown the quantities of stock received (Rec’d), on hand (O. H.), sold (Sold), and on order (O. O.).

According to the form, on August 1 there were on hand 19 pairs of shoes, size 9, and 11 pairs of size 9½. During that week, on consecutive days, 3, 4, 3, 6, 2 pairs of size 9 shoes were sold, of which 2 pairs (circled) were returned on the 4th and 5th; and 2, 2, 1, 3, 4 pairs of size 9½ shoes were sold, of which 1 pair was returned but again sold on the 5th.

On the first day of the following week 24 pairs of each size which had been ordered on the 2d of August were received. Upon their receipt the O. O. (on order) figures were inclosed in circles. On that day also the O. H. (on hand) figure was placed in its proper place in the size 9 group. All of size 9½ had been sold during the first week of August and there was of course no figure to be entered there.

The record is continued by daily postings of sales and by a weekly posting or entering of the stock on hand. Orders are entered on the day they are placed.

[Illustration: Form 43. Stock Control Card

Taken from Bulletin issued by the United States Chamber of Commerce]

With such a stock record a perpetual inventory is maintained and control over the movement of merchandise is secured.

=Problems Connected with the Merchandise Inventory.=—Proper accounting for merchandise at the time of inventory-taking and the close of the fiscal period requires a consideration of the following points:

GOODS IN TRANSIT. It may happen that certain goods have been ordered during the period, and that the invoice has been received but that the goods themselves are still in transit. The question whether or not such goods shall be included in the inventory may be viewed from different angles, as follows:

1. If the goods have been paid for in advance, they have undoubtedly been entered on the books as a charge to Purchases. If this is the case, the goods in transit must of course be included in the inventory as if actually received.

2. If the goods are still in transit but have not been paid for, it is customary not to charge them to Purchases until they arrive. If not charged to Purchases, or other similar account, they must not be included in the inventory. However, theoretically, this method is incorrect. The fact that the goods have been ordered and are now in transit makes the business liable for their purchase price, and although not actually received, in reality they form a part of the asset merchandise. It is true that until the goods are received, inspected, and accepted, the purchaser has the privilege of refusing them if they are not as ordered, but this privilege is exercised only in exceptional cases. Generally speaking, therefore, it is better to consider such goods as a completed purchase, include them in the inventory and credit the vendor for the amount of his invoice. Instead of being charged to Purchases account, such goods may be charged to Purchase Commitments which will better indicate their status.

GOODS RECEIVED BUT NOT YET BOOKED. In concerns where a separate shipping and receiving department is maintained, it may happen that the goods received by this department are not immediately transferred to stock or storage, in which case they may not have been taken up on the books. At the end of the period it is important to see that all such goods are properly recorded as purchased and are included in the inventory.

GOODS IN OR OUT ON CONSIGNMENT. Still another problem in connection with the inventory has to do with goods which do not belong to the business because they have been consigned to it for sale on account of their owner. Inward consigned goods must not be included in the inventory, if taken into stock, it is very important that they be so marked as easily to distinguish them from the regular stock.

Similarly, if goods are out on consignment to another market, they still belong to the business and must not be overlooked at inventory time. If the proper record is made at the time the goods are shipped, as will be explained in Chapter XLVIII, the

memorandum accounts on the ledger will call attention to them. In some concerns all such goods are entered as sales at the time of shipment. If at the end of the period part of these consigned goods are still unsold and in the hands of agents, they should be deducted from the sales for the period and included in the inventory at full cost.

GOODS FOR FUTURE DELIVERY. Goods sold for future delivery are best handled at inventory time in the manner suggested in Chapter XLVII, even if they are set aside ready for delivery.

GOODS READY FOR CURRENT DELIVERY. Finally, goods sold for current shipment but delayed in delivery on account of congestion in the service or for some other cause are best treated as sales and excluded from the inventory.

CHAPTER XLVII

SALES

=Importance of the Sales Department.=—Of the major departments into which business activities are commonly classified, the selling department ranks first in point of relative importance. Regardless of the efficiency secured in the other branches, regardless of the economy in buying and the excellence of administration, the life of a business largely depends upon the results obtained by the selling division. Since the sales department plays such an important part in the development of the business, it is evident that the accounting and financial problems connected with sales should be given careful attention and should be handled by the most scientific and up-to-date methods.

As before stated, one of the most important principles of modern accounting is that the system by which the records are to be kept must be planned in advance. The modern accountant must first know the kind of information that is desired and he then can classify the accounts so that the information may be obtained from the ledger or other records at any time, with the least possible effort.

=Basis for Sales Classification.=—The majority of enterprises at the present time deal in a number of commodities, the kind, quality, and grades of which are of such variety that careful classification is imperative. Formerly all goods sold were classed together under a single title “Merchandise,” with the result that no detailed information concerning the sale of particular goods, qualities, and grades was available and the manager or proprietor was unable to study the movement of specific classes of commodities.

Applying the principle of classification to sales, the basis for classification depends on the character of the business and the nature of the goods sold. Where the commodities dealt in are of such variety that it is impracticable to have a separate account for each kind, a more general grouping by classes may be necessary. Where the concern manufactures some of its commodities and buys the remainder in the open market, an analysis of sales on the basis of “own” product and “other” product may be wanted. Sales may be classified also on the basis of the sales contract, as cash, credit, instalment, sales to branches, consignment sales, approval sales, etc. Accounting problems in connection with these various types of classification will be treated in the present chapter.

=Principles Governing Analysis in Books of Original Entry.=—It is evident that the kind of classification shown in the ledger determines the journal analysis. That is to say, the analysis in books of original entry, and therefore their columnar ruling, always depends upon the way in which the accounts are classified and grouped in the ledger.

The various types of analyses, both in journals and in ledgers, make use of either (or both) horizontal or vertical distribution. In most forms or records, except in banking and allied institutions, the generally accepted practice is to reserve vertical distribution for showing chronological sequence, and horizontal distribution for any other kind of classification. The reason for this lies in the fact that the time basis requires practically unlimited space and the requirement can be met only by vertical distribution, consecutive pages being considered as the continuation of preceding pages. Horizontal distribution, on the other hand, is limited to the width of the page.

By reference to Chapter XLI, “Handling the Cash,” it will be noted that for the purpose of horizontal classification the sheet contains a number of money columns, each headed by an individual class title, and that each item is first entered in the general column and then extended to one of the subsidiary columns. This serves as a check against error, since it is evident that the total of the general column must be equal to the sum of the totals of the other columns, thus furnishing a fair though not complete proof that the extensions have been made correctly. All books where analytical processes are involved should provide some kind of internal

check. The student should refer to Chapters XVIII, XIX and XX, where form of analytic journals and explanation of them were given.

=Use of the Sales Ticket in Analysis.=—Since the sales invoice or ticket is the basis for entry and analysis in the sales journal, it must give on its face the information necessary for making the analysis. In accordance with the basis of classification used, it should show the department number, the kind of goods sold, whether for cash or credit, etc. The use of invoices with printed department numbers and of different colors for cash, charge, and C.O.D. sales, aid in making the record effective.

In a business of any size, the entry on the main sales journal only shows the total for the day's sales. The sales tickets lend themselves easily to grouping, and therefore a day's sales may be analyzed by sorting and grouping the sales tickets. Under any method of this sort, of course, each ticket must be used for the record of only one class of goods. Thus the totals of each of these sorted groups may be entered in the sales journal at the end of the day. Besides furnishing the totals for each group of sales, the individual tickets are used also for the purpose of posting the sales to the accounts of the particular customers.

After use in these various ways the tickets are filed away in binders for reference. Thus, the main books are freed of a mass of comparatively unimportant detail, to which it is necessary to refer only in rare cases.

=Analyzing Sales Returns.=—Attention should be called to the necessity of analyzing returned sales, allowances, and rebates, on the same basis as sales. Provision should also be made for a separate sales returns journal since the ordinary journal does not lend itself economically to an analyzed record of that kind.

=Purchases and Returned Purchases.=—It has been pointed out that the basis of classification of sales in the ledger determines the analysis in the sales journal. The same classification should also be applied to purchases, returned purchases, and inventories, because only in this way is it possible to determine the profit from the different classes of merchandise.

Similarly, all inward costs, such as duty, freight, insurance, handling, etc., which enter into the cost of goods sold must be analyzed on the same basis and apportioned to each group on some equitable basis. Because of practical difficulties, however, this analysis or apportionment usually is not made upon the first entry of these items on the records, but a distribution on a more or less arbitrary basis is made at the close of the period. In a large concern where very detailed information as to results is desired, an analysis of many other expenses and costs applicable to each sales group is made. Such a distribution of expense, however, leads into the field of cost accounting which is beyond the scope of the present discussion.

=The Handling of Cash Sales.=—Where an analysis by kind of commodity is unnecessary, a simple method of booking cash sales is by entry in a "Sales" column provided in the cash book, the total of which is posted to the credit of "Sales" in the ledger. Under this method, cash sales need not be entered in the sales journal. In previous chapters where the functions of the subsidiary journals were discussed, the practice of entering a cash sale in both cash book and sales journal was advised, so that the summaries of each may show true totals for those groups of business activities. However, this principle is often departed from and the method just described for booking cash sales is followed. Where an analysis of the sales is desired, the practical difficulty of providing analysis columns in the cash book for the cash sales in addition to analysis columns in the sales journal for the sales on account gives added weight to the principle stated.

It is sometimes desirable to distinguish between cash and charge sales, thus requiring two accounts, the "Sales on Account" and the "Cash Sales," to show the total sales for the period. This is easily accomplished by the use in the sales journal of the "On Account" and "Cash" columns whose totals furnish the amounts for posting to the two ledger accounts. Even were it desired to have two sales accounts, the cash and charge, for each department, the necessary information can be secured by providing in the sales journal two columns, a cash and a charge for each department and posting their totals to the two sales accounts carried for each.

A more complicated problem arises when it is desired to keep an account to show the total cash sales of _all_ departments and at the same time to keep one sales account for each department, in which will be recorded both cash and charge sales. The information can be placed on the ledger, but not without destroying the usual meaning of the Cash Sales account. The purpose is accomplished by providing the sales journal with two total or general columns—in addition to the departmental columns—one for charge and one for cash sales, and by carrying a Cash Sales column in the cash book. The items in the Cash Sales column in the sales journal are distributed to the proper analytic columns for classification. At the end of the period the totals of these analytic columns (which include both cash and charge sales items) are posted to the credit of the proper departmental accounts in the ledger. The total of the Cash Sales column in the sales journal, however, is posted to the _debit_ of Cash Sales in the ledger, which will be offset by a corresponding credit item from the Cash Sales column in the cash book. These two totals should agree provided

the books are completely posted.

=Sales to Branches.=—Sales to branches are made on different bases in different concerns. Sometimes such sales are charged to the branch office at cost, sometimes at full selling price, and sometimes at a fictitious figure. The first method is theoretically the best, but is not always desirable because head offices frequently prefer to keep their branches ignorant of cost prices. For this reason such sales are frequently charged to the branch office at the regular selling price. By this method, however, the books of the head office record the goods as if actually sold, while in reality they have been merely transferred to a branch office. Consequently, the books show a profit which is not yet earned. In order to correct this, it is necessary at the end of the period to make an adjustment entry covering all goods still in the possession of the branch office unsold at that time. By billing the goods at a fictitious figure the branch is also kept in ignorance as to real profits, but proper adjustment should be made at the close of the period for the reason explained just above.

Whichever method is followed, sales to branches should always be kept separate from the regular sales accounts. Where shipments of goods to branches are frequent and a matter of regular routine, a branch shipments journal similar to the sales journal should be provided; otherwise a special column in the sales journal will suffice. The total of such sales should be credited to a Branch Shipments, Branch Consignments, or some similar account, so as not to confuse these transactions with regular sales. The subject of accounting for both domestic and foreign branches is treated in Volume II.

=Consignment Sales.=—Consignment sales—which in some respects resemble branch sales—should also be recorded separately from regular sales. This is so because the title to goods out on consignment is still vested in the consignor and no element of profit appears in the transaction until an actual sale is made. However, in the case of an _occasional_ consignee as distinguished from a factor who deals regularly in consigned goods, it has usually been held that the title has passed to the consignee so far as the consignee's dealings with all except the consignor are concerned. Only in this way can the interests of innocent third parties be adequately protected.

The accounting for consignments is treated in Chapter XLVIII.

=Instalment Sales.=—The instalment sale should be treated in a different manner from regular sales because of certain special features connected with it. The chief characteristic of the instalment sale is the probability of the goods coming back into the seller's possession through forfeiture because of non-payment of instalments, the profit on the transaction of course being affected thereby.

The sale of goods with the privilege of payment in instalments is a well-recognized custom in certain lines, particularly in the furniture, piano, book subscription, and similar businesses. To protect the seller, the sale contract almost invariably contains a clause to the effect that title to the goods shall remain in the seller until final payment has been made, that failure to pay any instalment when due shall result in the cancellation of the contract, and that in such case the goods shall be returned to the seller. Experience with this class of sales shows that a large number of contracts are forfeited with or without return of the goods. Where the goods are returned, there is frequently a large loss through depreciation, the returned goods having to be treated as second-hand. In some instances, to enforce return of the goods migh

PREFACE

A knowledge of the subject matter of Volume I is a prerequisite to the profitable study of the present work. Therefore, it may be well to review briefly the contents of the latter as an introduction to this book. In Volume I the attempt was made to formulate and illustrate the basic principles upon which the practice of accounting is founded. The principles of debit and credit were developed and their application explained—as related ultimately to the balance sheet and statement of profit and loss. The chief books of original entry (the voucher register excepted) and the various ledgers were described and illustrated. Columnar books, controlling accounts, methods and devices for preventing and detecting errors, methods for the proper handling of purchases, sales, cash, and trade discounts, and some phases of proportion and interest were discussed in detail.

Some special applications of accounting principles, as viewed in relation to the accounting problems involved therein, were also explained and illustrated under such heads as: notes receivable discounted and dishonored; consignments and approval sales; single and joint venture accounts; accounts current, their reconciliation and adjustment; instalment sales; sales for future delivery; single entry, its methods and the results attainable under it; etc.

From the standpoint of business organization, the accounting problems peculiar to the single proprietorship and the partnership were given full treatment. The advantages and disadvantages of the various types of organization, the rights and duties of owners among themselves and to outsiders, the accounting procedure necessary under different conditions for changing from one form of organization to another, and other like items were set forth. Underlying the entire treatment of the subject was the guiding principle that accounting is never an end in itself, that its right to existence depends solely on the service it can render from the standpoint of administrative and financial management.

In content, the present volume is primarily a study of the corporation, its accounting and financial problems, although most of the material, in so far as it consists of a statement of general principles, is equally applicable to other types of organization. The

emphasis of the volume is laid upon the problem of valuation as met in the commercial balance sheet. Chapters IV to XXVII inclusive comprise this portion of the subject matter. The other chapters treat miscellaneous matters, a knowledge of which is essential to the student of accounting. These latter form parts of the work of the second year as mapped out in the author's scheme of instruction, whereby the whole field of accounting is covered by a well-graded three-year course of study. In this scheme cost accounting should be studied concurrently and as a parallel course with the work of this second volume. Only a bare outline of some of the problems and methods of cost accounting is presented in this volume.

As to the division of the text and its use in the general scheme, it is suggested that the first twenty-seven chapters should comprise the text material for the first semester, leaving the remainder for the second semester in which the chief emphasis should be placed on the solution of problems rather than on the formal classroom lecture. Hence the text material is lessened for this semester's work, and the student's main effort is directed towards the application to the problems of business of the principles already established.

Instead of following the plan of the first volume in placing the practice work for the student at the end of each chapter of text, this material is presented separately in three appendices. It is believed that this will be found a more convenient arrangement.

The author desires to emphasize the need of ample practice work and at the same time to take a stand against the method of teaching accounting exclusively by the so-called laboratory or case method. A happy combination of text containing a statement of principles and showing methods of application, together with practice material intelligently made up so as to require a knowledge of principles before solution, is the desideratum in any course of instruction. Principles, theory, without application are barren and soon slip away, even if seemingly understood at the time. Practice without a thorough grounding in fundamental theory can never be sure of itself. An equitable division of the student's time between theory and practice portions should be aimed at. In the present volume, while the time required for the practice assignments may at times seem heavy, an attempt has been made to keep it to the minimum deemed essential for adequate training either for general or professional use. It cannot be too emphatically stated that accounting as a profession ranks as to subject matter and the need for its services with the other professions. If it is to enjoy equal honor, dignity, and professional standing, teachers and practitioners must condemn without qualification the idea prevalent among many that a few months' training suffices to turn out a finished product. Too often has such a course given point to the witticism that an accountant is a bookkeeper without a job. As stated in the preface of Volume I, a course of at least three years' _professional_ study is now quite generally recognized as essential. Accounting is so broad in its many ramifications that less than that gives inadequate training.

The reception accorded the first volume and the report of results achieved in the classroom, through its use leads the author to hope that this second volume may have a courteous hearing and trial. Criticisms and suggestions will be much appreciated. The author hopes to be able to offer in the not too remote future the third and concluding volume in this series on general accounting.

The author is indebted for much assistance and counsel. Acknowledgment is due Miss Nina Miller of the Columbia staff and Eric Bodine for help in gathering and preparing much of the material for Chapters XXVIII to XXXIII; to H. A. Inghram of the University of Georgia, for preparation of a large part of Appendix D; to Leo Greendlinger and David E. Boyce for the use of problems prepared by them; and to his good friend, Joseph Gill, for help in reading the proof. To S. B. Koopman and James F. Hughes of the Columbia staff in second year accounting, the author is under special obligation for many suggestions. Mr. Koopman has furnished most of the problems for Appendix B, and has collected those for Appendix C.

As with Volume I, so in shaping the content of the present volume the author has had the good counsel and ever ready help of his chief, Robert H. Montgomery, and desires again to offer goodly acknowledgment, for his debt is large.

R. B. KESTER. Columbia University, New York City, August 5, 1918.

CHAPTER I

THE CORPORATION

The Corporation

In Volume I, Chapters XLVIII and XLIX, the fundamental characteristics of the corporation were explained and discussed briefly and some of its peculiar accounting features were set forth. Here these matters will be gone into more fully and additional aspects of this type of organization will be treated. In Volume I were explained the advantages and disadvantages of the corporate form, the procedure incident to the formation of a corporation, its charter, officers, working organization and management, the records peculiar to a corporation, the showing of proprietorship, opening the corporation's books, booking premium and discount on stock, change from partnership to corporation, the distribution of profits, dividends, etc. Only so much of the information already presented will now be repeated as may be necessary to make the treatment here complete.

Classification and Definitions

As instruments for the transaction of business, corporations may be classified in a number of ways. First, all corporations are either public or private. Public corporations are the governmental organizations set up to transact the collective business of a city, a county, a township, or school district.

Private corporations are divided into two subclasses, stock and non-stock. Under stock corporations are included all those organized to carry on business for a profit. Under non-stock corporations are included all those organized to carry on non-profit-making enterprises, such as libraries, hospitals, religious organizations, eleemosynary undertakings, etc.

Under the head of stock corporations we may have the following subclasses: (a) industrial or manufacturing, (b) commercial or trading, (c) public utility or quasi-public, and (d) financial, i.e., banks, trust companies, insurance companies, etc.

From the standpoint of the sovereignty to which allegiance is due, corporations are either domestic or foreign. A corporation is domestic in the state in which it is organized; foreign in any other state or country. Thus corporations chartered in New York are domestic in New York and foreign in New Jersey and Canada. A foreign corporation may be at a distinct disadvantage with a domestic corporation. To obviate this, one occasionally sees a separate incorporation in every state in which a concern intends to do business. Very infrequently is a domestic corporation subject to more stringent supervision and regulation than a foreign.

From the standpoint of the fact of incorporation, corporations may be classed as (1) de jure and (2) de facto, the former comprising those which have met fully all legal requirements for incorporation, the latter comprising those which have not met fully all legal requirements but are to all intents and purposes corporations in fact.

Method of Ownership

Business corporations are sometimes spoken of as “open” or “close.” An open corporation is one in which ownership of the stock is not held closely but is being passed about, traded in, or transferred from one owner to a new. A close corporation is one in which the stock is held very closely in order to retain control and keep profits and trade secrets within a small compass of ownership. Thus some corporations are strictly family affairs; others are held by a few families or a small group.

What is known as a corporation “sole,” while little known now, virtually exists in some close corporations, as where one man holds all but two shares of stock. The incorporation of a single individual is not legally possible in this country.

The corporation, because of its peculiar advantages over other forms of business organization, has become the accepted form for most large enterprises. The gathering together of large capital funds, the ease and efficiency of management and control, continuous life, the facility of transfer of ownership, and the limited liability of the stockholders, make the corporate form attractive to the investor and absolutely necessary to the large businesses carried on today. In some states encouragement is given the small business to incorporate; in the State of New York, for example, the minimum limit of capitalization is only $500. In a few other states the old-time fear of the corporate form is still expressed in their general corporation laws in which the minimum limit for corporate capitalization is set as high as $10,000.

Working Organization

The peculiar features of the stock corporation are the method of ownership and working organization. This latter is effected through a board of directors who are responsible directly to the owners at periodic intervals. Within the board are its officers and committees to whom duties are assigned by by-laws, custom, common consent or action of the board. Under these official heads are the rank and file of the organization—department heads, clerks, employees, etc. It is not necessary to treat here this phase of the organization further.

Different Classes of Stock

The collective capital of a corporation is divided into shares of equal value. Ownership of a share or shares in a corporation is evidenced by formal certificates of stock. Each share carries with it the same privileges, powers, and duties of ownership as every other share of the same class. It represents a pro rata share of the total interest of its class. There may be several different kinds or classes of ownership within the corporation, these classes will have different privileges, and there may be other points of differentiation. The reason for setting up these different classes is almost always to secure additional capital from outside sources by making the investment as attractive as possible. Upon a reorganization, an adjustment of the various interests concerned may require a grading of ownership, a differentiation by classes in order equitably to satisfy the claims of all interested parties. These

various classes of stock ownership will be discussed under the following heads:

1. Common 2. Preferred 3. Guaranteed 4. Founders' 5. Debenture

Common Stock

Common or ordinary stock is that which is evidence of ordinary ownership in the corporation. The share of ownership of the original organizers of the corporation is usually in the common stock. The common stockholder is a sort of remainderman, a residuary legatee. Upon dissolution, after the special claims and privileges of the other classes of owners have been satisfied, the common stockholders come in for their share. After the satisfaction of the claims of preferred owners, the common stockholders have a right to all that is left, their rights being simply residuary. They are subsequent to those of the other classes and to that extent inferior to them, though they may be more valuable.

Preferred Stock

Preferred stock has some kind of preference over the common. Such stocks differ among themselves, there being no standardized features applicable in every way to all kinds of preferred stocks. The basic purpose of the various preferences is to make the stock attractive from an investment standpoint. Common to all preferred stocks, however, is a preference as to dividends. Whenever profits have been made and have been set aside for dividend purposes, the preferred stockholders receive their dividends ahead of the common stockholders. If only sufficient profits are available to meet the requirements of the preferred stockholders and are appropriated for that purpose, the common owners receive nothing. Stock may be preferred as to assets as well as to profits. By this is meant that in case of dissolution the net assets remaining after payment of all outside claims are applied first to satisfy the interests of the owners of preferred stock and any remainder then goes to the common stockholders.

Cumulative and Non-Cumulative. Preferred stock carries with it a definitely stated minimum rate of dividend. The preferred claim to the profits may be cumulative or non-cumulative. In the one case, if profits are insufficient at any time to meet the preferred dividend requirements or are not appropriated for that purpose, the claims of the preferred owners _accumulate_ from period to period until satisfied in full. This satisfaction must take place before the ordinary owners can have any share in the profits. The rate of accumulation is the specified minimum and usually interest on unpaid dividends is allowed when the company finally settles these preferred claims. Of course, since dividends can be declared only out of profits, no claim for preferred dividends or any other kind can exist unless sufficient profits have been made. Non-cumulative stock is stock on which the dividend claim does not, if unsatisfied at any time, accumulate from period to period. Preferred stock is cumulative unless otherwise specified.

Dividends on cumulative stock do not have to be paid just because sufficient profits have been made. Declaration of dividends rests entirely with the board of directors who may see fit to appropriate profits to other purposes. A holder of non-cumulative stock may be very unjustly discriminated against in favor of the common stockholder by the withholding of all profits for a number of periods until a large amount has been accumulated. This is then disbursed as a dividend to the common owners after the deduction of as much as may be necessary to satisfy the preferred owner for the _current period_. On this account a non-cumulative stock is not attractive to investors.

Participating and Non-Participating. Preferred stock may be participating or non-participating. It is said to be participating when the terms under which it is issued provide that it shall share in any dividend in excess of its own specified minimum. Thus, if it is 6% preferred, after the preferred receives its 6% the common stock receives a like dividend, and then the preferred and common may share alike or in any agreed ratio in any further dividends declared in that year. Both participating and non-participating stock is either cumulative or non-cumulative. Preferred stock is non-participating when it is limited to the rate of dividend specified in the terms of its issue.

Redeemable and Convertible. Other features met in some preferred stocks are redeemability and convertibility. Preferred stock may be issued under a contract to redeem it, after a certain length of time, at a named figure—frequently par plus one year's dividend. Redemption may be either at the option of the holder or the company. Redemption may be serial, i.e., a certain amount called at stated intervals for redemption. Preferred stock is convertible when under the contract in the terms of its issue it may be converted into some other form of ownership or obligation. Thus, provision may be made that after a certain time has elapsed, preferred shares may be converted into common according to specified rates of conversion; or conversion into bonds of the company is sometimes provided for. Many nice adjustments may become necessary from an accounting viewpoint, when redemption or conversion take place at any ratio other than book values.

Guaranteed Stock

Stock which is issued under a guarantee to pay a specified dividend is said to be guaranteed stock. Inasmuch as dividends can be declared only out of profits, a company cannot guarantee its own stock—or rather a guarantee on the company's own issue must always be dependent or contingent upon the earning of profits sufficient for that purpose. Stock issued by one company and guaranteed by another may with strict propriety be called guaranteed stock. Thus, a large company may enter into a contract of lease with a smaller concern whereby the compensation shall be, let us say, an 8% dividend guaranteed to all holders of the stock of the smaller concern. Such a guarantee is not contingent but becomes a lien or claim on the guarantor company, regardless of the amount of its earnings.

Founders' Stock

In England there is issued what is known as "founders'" stock, a stock preferred as to its _share_ of dividends. Thus, a comparatively small portion of the common stock authorized might be set aside as founders' or promoters' shares with the stipulation that these founders' shares shall receive a dividend out of proportion to the ratio which they bear to the total common stock. The provision might be that these shares shall receive one-half or one-third—or any other specified share—more dividends than shall be given to the common owners. Instead of being preferred stock with specified dividend rate, it is preferred over the rest of the shares of the group from which it was originally set aside but its share of dividends is dependent upon the dividends given the rest of the shares. The par value of the founders' shares might represent only one-twentieth of the value of the rest of the group, while their share of the dividends would be, say, one-fourth as much as that of the other shares. This preference as to amount of dividends may give founders' shares a much higher market value than the other shares. Provision is sometimes made for their redemption, as usually there is such a marked difference between their amount ratio and their dividend ratio as compared with the other shares, that dissatisfaction among the owners results. Outstanding founders' shares may then interfere seriously with the marketability of the other shares.

Debenture Stock

The term debenture stock is applied to a class of liabilities rather than to proprietorship items. In England debentures of various kinds are frequently used. A recent book[1] thus describes them: "In Great Britain the term 'debenture stock' is used to designate an unsecured loan issued in _irregular_ amounts. If the amounts were fixed and equal, the issue would be called 'debenture bonds' or simply 'debentures.' Debenture stock is a debt of the corporation and does not resemble stock as used in this country." Debenture stock has not proven popular in this country, although used to some extent in Canada. The Public Service Commission of the State of New York defines debenture stocks as "those issued under contract to pay absolutely thereon at specified intervals a specified return." These stocks, while usually of limited life like bonds, are sometimes "perpetual and give the holders no right to demand the repayment of their capital, and the company no right to repay it."[2] When issued as perpetual, they somewhat resemble capital stock, as the term stock is used in this country. Because of the fixed and absolute charge for interest—or dividends as it is sometimes called—which these stocks carry, they are much more of the nature of bonds than of a stock indicating _proprietorship_. Debenture stocks are therefore to be classed as liabilities.

[1] "Business Finance" by Lough.

[2] "Stocks and Shares" by Hartley Withers.

Stock of No Par Value

A characteristic of most stock is that it bears a specified par value which must be uniform for all the shares within a class. The par value of the different classes may differ, however. In most states no regulation is made of the amount of par value. A par value of $100 is customary for industrial and commercial concerns, and of $1 for mining companies. Between those limits, and even beyond them, one finds stocks of almost any par value.

In the State of New York the issuance of stock of no par value is allowed. Both preferred and common classes may be issued without par value, but if the preferred shares have preference as to assets, the certificates for preferred shares shall state "the amount which the holders of each of such preferred shares shall be entitled to receive on account of principal from the surplus assets of the corporation in preference to the holders of other shares." With this exception, none of the certificates may express any nominal or par value and this statement of the amount of preference is regarded as an expression of par value for this purpose.

Each share is equal to every other share within its class.

Every certificate of such stock must bear plainly on its face the number of shares which it represents and the number of shares the corporation is authorized to issue. Regardless of the price paid for a share of such stock, all shares issued by the corporation shall be “deemed fully paid and non-assessable and the holder of such shares shall not be liable to the corporation or its creditors in respect thereof.”

To the heedless a named value on a certificate of stock is sometimes misleading as to the real value of the stock. The no-par-value stock overcomes this in that a prospective purchaser is at once put on his guard to find out the worth of the stock. Another advantageous feature is that the questionable practices sometimes indulged in of booking stocks sold at a discount have no place here because the stocks, having no par value, cannot be sold at a discount and the record of their sale will carry therefore the price at which they were sold. Some points in connection with booking this stock will be discussed later.

Watered Stock

So-called watered stock is stock which has a higher nominal value than the true value of the properties for which it has been issued. Thus, if $1,000,000 worth—par value—of stock is issued for the purchase of property which has a marketable value of only $750,000, the stock is said to be watered to the extent of $250,000. The bookkeeping equation requires that an equality be shown between the properties purchased and the par value of the stock, and this is usually done by inflating the value of the properties when they are brought onto the books.

Treasury Stock

Treasury stock, when the term is used properly, is stock which has been once issued as fully paid and which through purchase or gift comes back into possession of the issuing company. Stock which has never been issued should not be called treasury stock. The distinction between the two lies in the liability (or freedom from it) to further contribution, in case of need to meet the claims of creditors, on the part of stockholders who have bought their shares at less than par value.

In some states the sale of stock at less than par is forbidden. In those states where the practice is allowed, the purchaser of a previously unissued share at less than par is liable to the creditors (if the assets are insufficient to satisfy their claims) for a further contribution equal to the difference between par value and the price paid for the stock. If, though he pays less than par, the stock is issued to him by the corporation as fully paid and non-assessable, he is not liable to the corporation for any further payment to entitle him to all the rights and privileges of a shareholder; but he may be liable in case of need to outside creditors who have a right to expect always that assets of equal value to the stock issued therefor have come into possession of the corporation. As mentioned above, this trouble is obviated in the case of no-par-value stock. However, after stock has once been paid for in full, all future purchasers may hold it without liability for further contribution regardless of the price they pay for it. Because of its freedom from this liability, treasury stock has a readier marketability than unissued stock.

In some enterprises, particularly those of a speculative character where it is extremely difficult if not impossible to place a true valuation on the property to be used or exploited, the practice is very prevalent of issuing the entire authorized capital stock in payment for the properties to be acquired. The stock so issued thus becomes fully paid and its owners liable to no further contribution. To provide working capital, some portion of the stock is usually donated to the company for resale. This is sometimes called donated stock and is, of course, true treasury stock. In states where a corporation is permitted to buy its own stock, treasury stock may be acquired by purchase. Theoretically, stock which has been issued under a contract providing for redemption becomes treasury stock when redeemed and may be reissued until it has been canceled through charter provision to reduce the capital authorized. (See also pages 15, 16.)

Forfeited Stock

Stock is said to be forfeited through failure to make the agreed purchase payments on it. The laws of the different states vary with regard to the conditions under which stock may be declared forfeited. In some states the instalments paid on the stock—or all but a small amount to cover the cost of handling the transaction, or a specified portion of the amount paid in—must be returned to the purchaser. In others, the entire amount paid in may be declared forfeited. In the State of New York the provision in the law is as follows: “If default shall be made in the payment of any instalment ... the board may declare the stock and all previous payments thereon forfeited for the use of the corporation, after the expiration of sixty days from the service on the defaulting stockholder,

personally or by mail directed to him at his last-known post-office address, of a written notice requiring him to make payment within sixty days from the service of the notice at a place specified therein, and stating that, in case of failure to do so, his stock and all previous payments thereon will be forfeited for the use of the corporation. Such stock, if forfeited, may be reissued or subscriptions therefor may be received as in the case of stock not issued or subscribed for. If not sold for its par value or subscribed for within six months after such forfeiture, it shall be canceled and deducted from the amount of the capital stock." The provisions are very specific and must be carefully followed. The method of accounting is given on page =19=.

Bonus Stocks or Bonds

Bonus stocks or bonds are stocks or bonds given as a bonus upon the purchase of other stocks or bonds. Thus, upon the purchase of a share of preferred stock, one share of common may be given as a bonus.

ACCOUNTING FOR STOCKS

Accounting for the original issue of stock has been treated in Volume I. There several different methods of opening the records of the corporation were given and the manner of treating premiums and discount and instalment subscriptions was shown. Here some additional problems peculiar to corporation accounting will be discussed.

Discount on Stock

In the State of New York the stock of a corporation cannot be sold below par. Where sale below par is allowed, the proper booking of the discount requires consideration. The Interstate Commerce Commission requires that discounts or premiums be shown on the books under those titles, i.e., Discount on Capital Stock and Premium on Capital Stock. This method is to be commended as being true to fact and presenting a full and sufficient record of the facts. In the case of other concerns over whose accounting practices there is no regulation, that method is honored more in the breach than in the observance. A prevalent feeling is that the appearance on a balance sheet of such an item as discount on stock is a serious reflection on the standing of the corporation and is to be avoided in any way possible. Discount on stock is not an attractive item on a balance sheet, but there is little justification for such sentiment in those states where the sale of stock at a discount is a perfectly legitimate transaction. The balance sheet ought to represent facts as they are until they change; then the new conditions should be shown. So long as the discount on stock remains a fact it should be so shown. When the discount has ceased to exist through its absorption against premium on stock or the general surplus, it should no longer be reported because it is then a matter of ancient history with which the present is not concerned.

A favorite method of charging the discount on stock to organization expense is not approved, not because it is a misnomer, for discount may well be looked upon as one of the expenses of organization, but because it is an item of sufficient importance and interest to require separate record. Charging the discount to some asset account, when payment of stock is made by property instead of by cash, is to be severely condemned. Inflation of asset values to cover up such an item cannot be justified.

Premium on Stock

The premium on stock sold above par is best recorded in a premium account which should remain on the books as a part of the permanent capital and not therefore be transferred to surplus and returned as a dividend to the shareholder. It may be legitimately used to cancel any discounts.

In the State of New York a corporation cannot issue its stock "except for money, labor done, or property actually received for the use and lawful purposes of such corporation." A broad interpretation has been given the word labor so that under the law it may comprise both manual and mental labor and services of almost any kind legitimately received at the time of organization of the corporation or at any subsequent time. Stock may thus be used to pay for organization expense, promoters' fees, etc.

Property Exchanged for Stock

Where stock is issued for property, no more is supposed to be issued than has a par value equal to a fair market value of the property received therefor. In valuing the property the judgment of the directors is conclusive, unless fraud can be shown. Any stock issued for property becomes full-paid and the owner is neither subject to further call by the corporation nor liable to contribution for the benefit of creditors. In all statements and reports required by law to be published, stock issued for property purchased must be so reported.

Treasury Stock Donated

When treasury stock comes into the possession of the company by donation, the entries needed to show the transactions are somewhat as indicated below, some variations from the form shown being sometimes met with. Practice varies as to the value at which treasury stock shall be brought onto the books, some concerns booking it at an arbitrary value based on an estimate as to what it will probably bring when sold; others booking it always at par. Practice varies also as to the manner of showing treasury stock on the balance sheet, some listing it among the assets at the value at which it was brought on the books; others treating it as a deduction from authorized capital, a sort of valuation account for the capital stock. These points are discussed in Chapter XXI and will not be treated here except to state a conclusion on which the booking of the transactions depends. Manifestly, if treasury stock is to be treated as a deduction from capital stock, it will have to be brought onto the books at par. Such treatment usually results in an inflated showing of the surplus arising from the donation until that has been adjusted to the values realized from its sale—an adjustment which cannot be completed with accuracy until all treasury stock has been disposed of. If treasury stock is to be shown among the assets on the balance sheet, it is perhaps best booked at an estimated realizable price, a method which will show the donated surplus also at an estimated realizable figure. While authorities differ on these points, the weight of opinion seems to favor booking treasury stock at par and showing it as a valuation account on the balance sheet.

For the sake of illustration assume that the stockholders donated $100,000 par value of common stock to the corporation and that $50,000 of it is sold at 60 cents on the dollar. The entries to record the transactions would be:

(1) Treasury Stock, Common $100,000.00 Donated Surplus $100,000.00 (With suitable explanation.)

(2) Cash 30,000.00 Discount on Treasury Stock, Common 20,000.00 Treasury Stock, Common 50,000.00

Other titles for Donated Surplus are “Donated Working Capital,” “Donation Account,” etc. The account “Discount on Treasury Stock, Common” will ultimately be closed against Donated Surplus, and there is no objection to making the charge for discount directly to Donated Surplus instead of as shown above, although the method shown perhaps makes more easily available the information as to the discounts allowed on sales of various portions of the treasury stock. If it is sold at one price, the charge for the discount should be direct to Donated Surplus. A balance sheet drawn up at an intermediate period, i.e., before Discount on Treasury Stock is closed, should show Donated Surplus at its adjusted figure, viz., book value less discount. After all treasury stock has been sold, the Donated Surplus account, as adjusted, will show the true surplus arising out of the donation transactions. The proper disposition of this—as to whether it should be maintained as a permanent increase in capital, be transferred to general surplus and so be made available for dividends, or be treated as a deduction from plant values on the theory that they have been overstated as originally booked—is discussed in detail in Chapter XXI.

Bonus Stock

Bonus stock is usually treasury stock for the very good reason that, if it carried a liability for contribution in amount up to its par value, recipients of such stock might not be overly appreciative of the gift. Instead of being an incentive to purchase the securities which it accompanies as a bonus, it might act as a deterrent. Bonus stock is a gift on the part of the corporation and is therefore an expense. While custom favors recording the expense under the title “Bonus”—or even including it with organization expenses—and treating it as a deferred expense for a number of periods, a correct analysis of a bonus stock transaction may dictate other method of record. If the bonus stock is given with an issue of bonds which could by themselves be disposed of only at a discount, the difference between the market value of the bonds alone and their par value should be charged to Bond Discount, and the rest of the loss on the transaction may be charged either to Bonus account or Discount on Treasury Stock. This distinction is important, as will be seen in Chapter XX where the true nature of bond discount is discussed. When data are available for making the separation it should always be done. Thus, if a $1,000 par bond has a market price of $950 but when sold with one share ($100) of treasury stock as a bonus brings $1,000, the record should be:

(3) Cash $1,000.00 Bond Discount 50.00 Bonus (or Discount on Treasury Stock) 50.00 Bonds Payable $1,000.00 Treasury Stock 100.00

The customary method of showing, as in entry (4) below, is theoretically incorrect, though it may be necessary to use it when the data needed for the other entry, i.e., (3) above, are not available.

(4) Cash $1,000.00 Bonus 100.00 Bonds Payable $1,000.00 Treasury Stock 100.00

If a bonus of treasury stock is given with the sale of preferred stock, similar treatment would make possible a showing of the portion which is really discount on stock and the portion, if any, which is true bonus. Inasmuch as discount on stock and bonus are very similar in kind and in manner of treatment on the books, nothing of real value is perhaps gained in making the separation. The ultimate disposition of the Bonus account is, as indicated above, to treat it as a deferred expense, charging it against profits as rapidly as conditions warrant. It is an undesirable item on the balance sheet or ledger and should be expunged as soon as possible.

Treasury Stock Purchased

Treasury stock which is created by purchase by the issuing company requires consideration. If the price paid is less than par, carrying the treasury stock on the books at par requires an offsetting credit account similar to the Donated Surplus account used above when the stock is created by donation. This credit account simply represents a book surplus and should not usually be made the basis for a dividend. This account may be called “Treasury Stock Surplus,” “Contingent Profit on Treasury Stock Bought,” or other title indicating the true nature of the item. When the treasury stock is resold and the discount or premium on it is charged against this surplus or credited to it, as the case may be, the balance of the Treasury Stock Surplus account will then show the realized profit or loss on the completed treasury stock transactions and may be disposed of as indicated above for Donated Surplus.

On the other hand, if the price paid by the company in the purchase of its own stock is more than par, the premium paid must be charged against general surplus because there is usually no other place for the charge unless there is still open on the books a Premium on Stock account arising out of a previous sale of stock at a premium. Purchase of stock at a premium may represent simply the payment to the owner of the stock of his share in the general surplus of the company, in which case the premium paid must be shown as a reduction of that surplus.

Redemption of Preferred Stock

Handling redemption of a preferred stock issue is exactly the same as handling treasury stock by purchase. If by contract agreement at the time the preferred stock was issued it can only be redeemed at a premium, the premium must be charged, as indicated above, to an open premium account or to general surplus. The effect is similar to the payment of a special or extra dividend at the time redemption is made.

Forfeited Stock

Payments made on stock which is declared forfeited constitute an item of surplus but of a permanent nature, i.e., not a surplus applicable to the declaration of dividends, though there may be no legal inhibition to that use. If the stock is resold any discount on the resale is properly charged against the surplus arising from the forfeiture. By way of illustration, assume that $1,000 worth of stock has been subscribed for and payments amounting to $400 have been made when the stock is forfeited for failure to pay further instalments. The stock is offered again for subscription and is sold for $900 and payment has been received in full. The entries necessary to show the above are:

(5) Subscribers $1,000.00 Capital Stock Subscriptions $1,000.00 (6) Cash 400.00 Subscribers 400.00 (7) Subscribers 400.00 Surplus from Forfeited Stock. 400.00 To transfer the forfeited payments to Surplus. (8) Capital Stock Subscriptions $1,000.00 Subscribers $1,000.00 To reverse. (9) Subscribers 900.00 Surplus from Forfeited Stock 100.00 Capital Stock Subscriptions 1,000.00 (10) Cash 900.00 Subscribers 900.00 (11) Capital Stock Subscriptions 1,000.00 Capital Stock 1,000.00

Stock of No Par Value

Booking capital stock of no par value presents no new principles. Inasmuch as the stock has no fixed par value, its sale is recorded for what it fetches. There can be neither discount nor premium. Payment of the subscription may be made, just as in any other case, by means of cash, property, or services, and the same care must be exercised in placing proper valuations on the property taken over. Here there is not the danger of inflating property values to show them equivalent to the par value of the stock issued therefor. Rather, subscription for the stock is made at the figure of the fair value of the property to be turned over in payment of the subscription. In the case of no-par-value stock even greater care must be exercised to see that the contributed capital shall never be encroached upon in the declaration of dividends, and careful supervision is somewhat more difficult because the _number_ of shares issued bears no relation to the _amount_ of the capital stock.

Distinctive Records

The accounting and other records peculiar to a corporation are explained in Volume I, Chapter XLVIII. These records are the subscription book and subscription ledger or instalment book, the stock certificate book and stock ledger, the stock transfer book, the minute book, sometimes a dividend book, in large companies a register of transfers (which classifies the information as to transfers given in the stock transfer book, and so may serve as a convenient posting medium for the stock ledger), and a stock register (a record kept by the officially appointed registrar of the corporation, whose duty it is to see that there are no irregularities in the issue of stock and that there is no overissue). The stock register should show the amount of stock authorized and the amount issued at any given time, the balance being the stock not yet issued. A form for the stock transfer book and several forms for stock ledgers as prescribed by the Comptroller of the State of New York are shown below.[3] The two latter forms of the stock ledger are applicable only to the State of New York.

Ledger Folio 27 Transfer No. 556 ALLIANCE AUTOMOBILE COMPANY

For value Received, I hereby sell, assign and transfer unto John H. Lansing, of Newark, New Jersey, Seventy-six Shares of the Capital Stock of the above-mentioned Company, now standing in my name on the Company books and represented by surrendered Certificates Nos. 32, 37, and 44.

Witness my hand and seal this 28th day of September, 1918. GEORGE B. GOLDMAN [L. S.] By GEORGE GALE, _Attorney_.

New Certificate No. 224 Issued to John H. Lansing Ledger Folio 84

Stock Transfer Book

Stock Book or Stock Ledger

[Illustration: _Stock Book to be Kept by Brokers (New York Form Prescribed by Comptroller)_]

[Illustration: _Stock Book to be Kept by Corporations and Transfer Agents (New York Form Prescribed by Comptroller)_]

Stock Ledger

The stock ledger is a subsidiary ledger controlled by the Capital Stock account or accounts on the general ledger. It may, of course, be made self-balancing just as any other subsidiary ledger. There has been some controversy as to whether the stock ledger is normally a credit or a debit balance ledger. In some concerns the stockholder is debited with the shares owned, and in others he is credited. Theoretically, in accordance with the principle of all other controlling accounts, the subsidiary ledger—in this case, the stock ledger—merely carries the detail of the controlling account. If, then, the controlling account is a credit balance account, the accounts on the subsidiary ledger must similarly have credit balances. Accordingly, the stockholder should be credited with his net holdings. Practically it makes little or no difference because the subsidiary ledger is no integral part of the debit and credit scheme of the general ledger. Of course, unless practical difficulties prevent, practice should always follow the theoretically correct method. No difficulty need be experienced, however, in accommodating oneself to either method of record on a subsidiary ledger. In the

stock ledger the record of holdings is kept in terms of the number of shares owned rather than by the par value of the holdings.

Minute Book

Before leaving the subject of the records peculiar to a corporation, it is desired again to call attention to the keeping of a careful record in the minute book. This book should contain first a copy or duplicate of the corporation's charter. Following this should be the by-laws of the corporation. Sufficient blank space should be left at the end of each of these documents to make record of any amendments to charter or by-laws. There should follow a complete record of the deliberations and authorizations of the board of directors as affecting the management and control of the corporation's policy. The minute book is often the source of authority for many of the most important entries made on the books of account, and great care must be used to make the record full, complete, and accurate. Such matters as leases, purchase and sale of properties, bond issues, dividends, and other similar items should have very careful record.

Conclusion

Other features of the corporation from the accounting point of view are treated under their respective heads in later chapters. These include such items as bond issues, sinking and other funds, reserves and surplus, scrip and stock dividends and other dividend considerations.

It is proposed in the next two chapters to discuss the corporation from the manufacturing viewpoint, types of accounting records sometimes used therefor, and the elements of manufacturing costs. After that the problem of the balance sheet and the principles of valuation applicable to it will claim attention.

CHAPTER II

THE VOUCHER SYSTEM

Purchasing for the Manufacturing Business

Accounting for the business which manufactures its own product is a much larger problem than that for the concern which limits its activity to purchase and sale of a stock-in-trade. To the activities of a trading concern the manufacturing business adds those of the factory. Not only must more property, and a larger variety, be kept account of and handled so as to get the most efficient return therefrom, but also in the handling and operation of this property a somewhat distinct type of expenses is incurred. The problems of financial and factory management and control are different and more complicated than those of the trading business. The period between the expenditure of funds for the purchase of materials and the payment of expenses and the receipt of money from the sale of the finished product is much longer. More working capital must therefore be provided and its rate of turnover is less. A larger element of risk enters in. Raw materials must be worked and fashioned, machinery must be employed, a different class of labor must usually be handled, perhaps will have to be trained—these are problems calling for a special type of management for the manufacturing end of the business.

The accounting department must be organized to serve these additional demands and complexities of management and to give the needed information. The amount and cost of the materials consumed in making the product, the labor cost expended on it, and the various items of factory expense incurred, during one period as compared with the same items for previous periods—all must be kept under constant review if successful operation is to be secured.

Expansion of the Purchase Journal

To make this information available as soon as the transactions giving rise to it are entered into, a different method of gathering the information becomes necessary. Because of the fact that the purchase journal is limited to the record of purchases of stock-in-trade, and that information in regard to expenses incurred is not usually brought on the books until payment of them is made, not only do the books fail to give the service which a management has a right to expect of them but they fail to reflect many liabilities at the time they are assumed. Thus a new type of record is needed.

This has led to an extension or expansion of the purchase journal. The way in which this journal can be used so as to analyze purchases of stock-in-trade on a departmental basis has been explained and illustrated in Volume I. This new use of the purchase journal is merely an extension of the principle of analysis there developed. Instead of limiting it to a record of transactions involving

purchases of stock-in-trade, every purchase transaction, whether of assets, supplies, or of service of any kind, finds this its place of first record. By introducing sufficient columns, as detailed an analysis of all the purchasing activities of the business can be secured as may be desirable. Furthermore, entry here being made at the time of the purchase rather than at the time of payment for the purchase, the books make available a mass of valuable data needed for purposes of management much sooner than it becomes available under the former restricted use of the purchase journal.

Development of Voucher System

Had the evolution of this record stopped here, the resulting gain would have been secured at high cost. The entry of all expense purchases in the purchase journal creates the necessity of opening accounts on the ledger with numerous creditors for small purchases, as well as the more important items, both to show the liability incurred and to provide a means of canceling it when payment is made. In large corporations, where oftentimes the policy of securing bids on all purchases is followed, resulting in a constant changing of firms from whom purchases are made and no regularly established trade with any of them, the burden of handling the creditors ledger becomes an increasingly heavy one with little or no gain in desirable information furnished by it. Accordingly, a further development took place which eliminated the necessity of opening regular accounts with every creditor, but instead made every transaction, whether one or many were entered into with the same individual, independent of all others. This makes possible the showing of the settlement of that transaction in the place where its original record was made, without opening up a ledger account for it. This use of the purchase journal with some slight additions has given rise to the so-called “voucher system” of handling purchases.

Definition and Description of Voucher

In a broad sense, a voucher is a statement which certifies, i.e., vouches for, the correctness of a transaction. As used in the restricted sense to which it is limited under the voucher system, it is a more or less formal document which shows a receipt for a particular bill of items. As distinguished from a receipt in general, this latter term is applied to all acknowledgments of money paid whether or not for a particular bill; whereas the essence of voucher accounting requires receipts for particular bills. At law a voucher has no more weight than an ordinary receipt, and a signed receipt is only prima facie evidence, capable of refutation, though the burden of proof of non-payment is placed on the complainant.

A formal voucher must therefore provide for a statement of the bill of which payment is being made and a place for acknowledgment of receipt of payment by the payee. Usually provision is made also for: (1) certification of the correctness of the bill by properly authorized house employee and its approval for payment; and (2) a proper distribution on the accounting records of the payments authorized, i.e., an official determination of the debit and credit entries to be made on the books.

A form of voucher is shown on pages 30, 31. On the face of the form provision is made for (1) detailed statement of bill; (2) house approval of same; and (3) receipt form to be signed by payee. On the reverse side of the voucher the distribution of the charges is provided for. This is the bookkeeper’s authorization for making the indicated entries on his books. The form is so devised that, when doubled, it is of a convenient size for filing in a vertical file.

Operation of Voucher System

When the invoice covering any purchase is received, it is held till the commodities bought arrive. After inspection and acceptance of the goods, a voucher is made out in duplicate on which is written a copy of the invoice, with the cash discount, if any, shown deducted. Vouchers are given consecutive numbering just like checks. If immediate payment is to be made, the voucher will be “approved” and check drawn for the amount. The voucher with check attached is sent to the creditor with a request that he receipt the voucher and return it. A creditor is not usually particularly interested in helping another concern keep its books and the result is that a large number of vouchers find their way into the creditor’s waste basket. It is here that the duplicate copy retained in the files serves to keep the file of vouchers complete, though it does not, of course, constitute a receipt for the payment.

Sometimes before sending the original voucher, the distribution of the charges is made on it, and it is used as the basis of the bookkeeper’s entries. An objection to this method is frequently made that the creditor is thus given some insight into the business and perhaps a more intimate view of it than may be desirable. Where such is the case, only the office copy of the voucher shows the distribution and the book entries are made from it. Both may be filed together when the original is returned, or the one may be filed numerically according to voucher numbers, the other alphabetically according to creditors’ names and so serve as an index to the numerical file.

[Illustration: _Voucher (face)_]

[Illustration: _Voucher (reverse)_]

In some concerns the canceled checks when returned by the bank are filed with their respective vouchers; in others, they are filed separately in their own sequence. Inasmuch as each voucher also carries its check number, cross-reference is easy.

Voucher Check

The difficulty referred to above in securing prompt return of receipted vouchers has led to the introduction of a combined voucher and check called a “voucher check.” The indorsement on the check, which is necessary for its collection, serves at the same time as a receipt of the bill. All vouchers thus ultimately find their way back through the bank. The legality of the indorsement serving also as an acceptance of the check in payment of the stated invoice has been thoroughly established, particularly when on the blank space for indorsement attention is drawn to the fact that such indorsement will constitute a receipt for the bill; or where the face of the check states that it is full payment for the invoices covered by it.

Two forms of voucher check are in use, the folded check and the single. Below are given illustrations of both. If such checks are not unduly large, banks do not object to handling them.

Because of lack of room on the voucher check, provision is not always made for showing the distribution of the charges. The single form of check can be used when a detailed statement of invoices is not desirable or when invoices carry but few items. Such a voucher check, but differing somewhat from the one shown, is frequently used for the payment of dividends to stockholders and does away with the need of a formal receipt or of signature in the dividend book.

Form of Voucher Register

The “Voucher Register,” or the “Accounts Payable Register,” as it is sometimes called, is the book of original entry in which the voucher and its distribution are recorded. This register is a journal so far as its scheme of debit and credit is concerned, but its record is not usually supplemented by a formal subsidiary ledger—though it may be—posting of it being limited to the general ledger. The register must provide columns for date, voucher number, name of creditor, explanation, amount, distribution, and payment. There are many different forms and rulings, the information desired never being quite the same in any two businesses, but a typical form of voucher register is shown on page 35.

Distribution of Vouchers

As soon as a purchase invoice has been approved, a voucher—sometimes called a voucher jacket where the original invoice itself is attached to it—is made for it, the distribution of the charges is authorized, and entry is made in the voucher register. All vouchers are numbered consecutively and entered in numerical sequence, which is usually also chronological sequence. The amount of the voucher is entered in the total column, Vouchers Payable or Accounts Payable, whatever the account title is on the general ledger. The next column, Purchase Discount, may or may not be merely a memorandum column, depending on the use made of it, as will be explained later.

[Illustration: _Voucher Register (left-hand page)_]

[Illustration: _Voucher Register (right-hand page)_]

From the Vouchers Payable column, distribution on the same line is made into the columns for the various accounts to be charged. To secure a complete distribution without waste of space, a Sundry Charges column is provided for entry in detail of all items of infrequent occurrence, each account to be charged being named in the explanation space to the right of this column. Following this comes the record of date and manner of payment, with a final column in which to extend at the end of the month all unpaid vouchers and so indicate the detail of the total outstanding liability. The voucher record is capable of almost indefinite expansion through the use of short-margin insert sheets. Provision can in this way be made for a large number of columns for analysis.

Posting of Summary Totals

At the end of the month, or oftener if desired, the voucher register is summarized and posted. Inasmuch as usually no subsidiary ledger is kept when the voucher system is in use, there is no day-to-day record on the ledger of the purchasing activities of the business. Accordingly, a complete double entry must be made by way of periodic summary. It was at one time thought desirable to make this summary entry through the general journal or, at any rate, by setting up a formal journal entry on the face of the voucher register. As the degree of analysis increased, the futility of such a procedure became apparent and now posting to the ledger accounts is made directly from column totals as shown in the illustration. The Sundry Charges column is posted in detail to the named accounts as indicated. Proof of distribution should always be secured by checking the total of the distributive column totals against the total of the Vouchers Payable column. In posting, the total of the Voucher Payable column is credited to its account, while the totals of the distributive columns are debited to their respective accounts.

Effect on Cash Book and Bank Account

The advantage of this periodic posting of expense column totals as compared with the detailed posting of such items from the cash book as required under the old method is apparent. The cash book is in this way relieved of all need of naming the account to be charged for each detailed entry, the proper charge having been made from the voucher register. If every transaction which will ultimately give rise to a disbursement of cash is vouchered and therefore recorded through the voucher register, there is really no need of a detailed entry of the checks on the cash book, for only their total is posted. It is perhaps more usual, however, to enter them in detail on the cash book. Entry here is, as always, chronologic, by date of payment.

Sometimes, to facilitate reconciliation with the bank account, the voucher checks are given a new series of numbers known as treasurer's numbers when issued in payment of invoices. Where this is done, the cash book shows entry of all checks in the numerical sequence of treasurer's numbers, just as entry in the voucher record is in the sequence of voucher numbers. Some checks are held before issue longer than others, due to different lengths of credit term, etc.; hence the need for this new series of numbers.

Payment of Vouchers

After a voucher has been made up and entered in the register, if payment is to be made immediately, it is passed for payment by the treasurer or other fiscal officer and the check is drawn and issued. Any cash discount offered is shown deducted on the face of the invoice and the check carries the net amount. Where payment is not immediate, but observance of the terms of credit is necessary to secure the discount, the voucher should be filed away in a tickler file which will automatically bring it up for attention at the proper time. The original invoice is placed in a temporary file, arranged alphabetically, until paid, when it may be removed and filed permanently with the paid voucher. Upon payment of the voucher, the check is entered among the cash disbursements and a notation is made in the payment column of the voucher register as to the date and manner of payment.

Voucher Index of Creditors

It has been stated that one of the essential features of the voucher system, as it is usually operated, is the dispensing with the formal creditors ledger. This is accomplished by treating every transaction as an independent unit, numbering it, and providing a place in the voucher register to indicate its payment, so that there is no need of a separate ledger to keep track of the cancellation of the liability. The voucher system fails, however, to give a record of volume of business done with each creditor. Furthermore, it is often desirable to make reference to past transactions with creditors. This would be very difficult without a definite knowledge of the voucher numbers under which account has been kept of the transactions with a particular creditor.

Accordingly, for the proper operation of the system an alphabetic index of creditors must be made up on which should be shown the voucher numbers relating to transactions with each creditor. This is usually of the card index type, each creditor being provided with a card on which is noted a list of the vouchers recording the business done with him. This voucher index, while not a ledger in the accepted sense, yet when operated in connection with the Payment column in the voucher register serves all the essential purposes of a creditors ledger, and the use of the "Unpaid Vouchers" column, as explained above, secures at the end of the month the detail of the summary account, Vouchers Payable, carried on the general ledger.

Control of Vouchers Payable

With the elimination of the detailed ledger record which served as a check on its controlling account on the general ledger, particular care must be exercised to see that the control account, Vouchers Payable, reflects the correct summary of all detailed liabilities. This is readily accomplished when every item that leads to a disbursement of cash is vouchered. Then the only postings to “Vouchers Payable” come, for their credits, from the total of Vouchers Payable column of the voucher register, and for their debits, from the total of Vouchers Payable column in the cash book.

Introduction of System

Some of the problems encountered in the operation of a voucher system will now be discussed, the first of which is the introduction of the system in a business where the old method of handling purchases is in use. The requirement here is the closing of the open accounts on the purchase ledger and their transfer to the voucher register. This may be accomplished in two ways—one of which requires a change in the controlling account, and the other of which does not. Under the first plan without formality, the accounts in the purchase ledger are balanced and closed by indicating in their explanation columns the transfer of the balance to the voucher register. As these accounts are entered on the voucher register, each of the _items_ comprising the balance of an account should be given separate vouchers rather than entered under one voucher for the whole amount. This is particularly true where the different items are subject to different discount and credit terms, rendering it undesirable to pay them all at the same time. After entry on the voucher register, the amounts may be distributed to the Sundry column and charged to the controlling account, Accounts or Vouchers Payable, as the case may be. The register should now be totaled, i.e., the Vouchers Payable and Sundry columns should be added and the register ruled off. These totals, being to the credit and debit of the same account, may or may not be posted, as the balance of the controlling account is not affected. Under the second plan the register is left open, i.e., not totaled. In this way the credit to the Vouchers Payable account is included with the total to be posted at the end of the current month when the register is first summarized. This, of course, necessitates posting the corresponding debit of the amounts distributed to the Sundry column as explained above.

The new voucher system is now ready for use and current entries will be made as previously explained.

Purchase Returns and Allowances

The handling of purchase returns and allowances is awkward under the voucher system. If the goods can be inspected and accepted or adjustment secured when necessary, before the voucher for the transaction is made up, then the amount to be paid is always the amount of the voucher and no change need be made in the amounts entered and distributed on the register. Where this is done a Purchase Returns and Allowances Account is not required. This procedure, however, is not always possible, for a first inspection does not always show the true condition of goods. Adjustment of the general ledger accounts could be made by entry of the return or allowance through the general journal. That would not, however, leave any indication in the voucher register record of the fact that cancellation of the liability there shown was made by payment of a lesser amount than the one entered, and it is desirable that these two amounts be the same.

To accomplish this, entry of the allowance should be made, in small red ink figures on the upper part of the line just below the vouchers affected, entering in red the voucher number—the same as the voucher to which it applies—and the amount of the allowance, both in the Vouchers Payable column and the distributive columns affected by the allowance. These red ink items are, of course, deductions, the summary amounts of the various columns being net totals, i.e., the totals of regular items less the red figures; or two totals may be shown, one above the other, the regular and the red. Where both black and red totals are shown, both must be posted, the red as contras or offsets to their corresponding black postings. If desired, separate Purchase Returns and Allowances accounts may be opened.

An alternative method, requiring more work but handling the difficulty somewhat more neatly, cancels the original voucher by marking it paid and its check void, and issues in its stead a new one for the correct amount. The new voucher is handled regularly in the cash book, but in the register distribution is made to the Sundry column and charged to Vouchers Payable, as the purchase has already been charged from the original voucher. This charge to Vouchers Payable cancels the credit from the journal and allows the liability for the new amount to be shown in the total of the Vouchers Payable column of the register. The cancellation is best evidenced by entry in the general journal somewhat as follows:

Vouchers Payable $2,150.40 Vouchers Payable $2,101.59 Purchase Returns and Allowances 48.81 To cancel Vo. #2158 and authorize its reissue in Vo. #3245, account of return of defective goods.

Under this method postings to the Vouchers Payable account, instead of being limited in their origin to voucher register and cash book, will be made also from the general journal.

Partial Payments

A similarly awkward situation is met when it becomes necessary to make partial payments on a voucher. The whole system is built on the idea that each voucher is the unit according to which the record is kept. It, therefore, presupposes settlement in full of each voucher; otherwise, the efficient operation of the system is interfered with. Settlement in full is not always possible, however. Since provision is made in the register for but one line on which to show payment of the voucher, it is not possible to indicate partial payments in the allotted space, nor would such practice be desirable.

Hence, where partial payments are to be made, the original voucher must be canceled in full and two new vouchers issued in place of it—the one for the amount of the partial payment, which will thus cancel it, and the other for the unpaid balance, which will remain open until paid in full or till other partial payment is made. In the latter case the same procedure of cancellation and issuance in its stead of two vouchers must be repeated. This process of cancellation by the reissue of two new vouchers may be effected directly on the face of the voucher register by a full cross-reference between the old and the new, usually shown in the Manner of Payment column; or it may be done by formal entry on the general journal, which will then constitute the authority for the transaction. At the best, it is an awkward situation and where financial arrangements cannot be made so as to make partial payments unnecessary in large measure, the voucher system itself should be discarded as not adapted to the conditions of the business.

Handling of Notes Payable

Practice differs, under the voucher system, in the handling of notes payable. If a note is given or a draft accepted upon the purchase of goods, the liability for it will appear on the books only as a note liability, provided the purchase is recorded through some other medium than the voucher register. This medium might be the general journal or the notes payable journal. If, however, original entry of the purchase is made in the voucher register, liability for it is thereby created under the account title, Vouchers Payable. This must be shown canceled by the creation of a note liability in its place, by entry in general or notes payable journals. If the voucher check system is used, the check on the original voucher must be canceled by marking it “Void” or by running it through the bank with the day’s deposits. In either case for the sake of a complete record of check numbers, it should be entered among the cash disbursements. From all this it is evident that less work is entailed and just as complete a record made by entering the purchase originally in general or notes payable journal as suggested above.

In order to maintain proper control over the cash, when the note becomes due a check should be drawn for it rather than allow its payment to rest merely on the bank’s memo of charge against the account, where the note is made payable at the bank. If a voucher check system is in use, payment by check results in a momentary transfer of the liability from its status as a note liability to a vouchers payable—an open account—liability. Cancellation of the note is made by distribution of the voucher to the Sundry column of the register as a charge to Notes Payable; the voucher not being made or entered until the note falls due. Simultaneous entry of the check in the cash book cancels the voucher payable liability and completes the transaction.

If the note is given in cancellation of the open account which had been set up by previous entry in the voucher register, then the same procedure must be gone through, as was explained above in connection with the practice of invariably entering every purchase on the voucher register. If the note transactions are many, it would prove much less laborious to accept the bank’s memo of charge as adequate evidence of payment, this memo being given a treasurer’s number in proper sequence, where treasurer’s numbers are given to establish order of entry on the cash book. Cancellation of the notes payable liability is then posted from the cash book entry.

Cash Discount on Purchases

A final problem in connection with the voucher system concerns the treatment of cash discount on purchases. As discussed in Volume I, Chapter XXXVI, a cash discount is usually treated as a financial management item, though it is sometimes looked upon as a purchase department item. The handling of the voucher register so as to record properly the purchase discount will depend somewhat upon which theory of cash discount is adhered to. It is customary to carry a Purchase Discount column in the voucher register, although this is unnecessary if one is carried in the cash book. Where both cash book and voucher register are provided with discount columns, one is usually merely a memorandum carried for the sake of easy reference.

As regards the amount at which the liability under Vouchers Payable is carried on the books, we find two methods of making up the voucher and entering it on the register. This is in turn closely related to the financial policy as to the taking of discount. If it is an invariable rule of policy always to maintain a sufficient cash balance to take advantage of all discount offerings, there is nothing seriously wrong with the practice of making up the voucher and entering it for the net amount in the Vouchers Payable column; for if the policy is adhered to, no understatement of liabilities will result. If the policy is not strictly adhered to, constant adjustment will be necessary to make the books reflect the true liability.

A voucher entered net should have the discount shown in the Discount column and the gross amount in the distributive columns. Mathematical proof of the voucher register is secured by checking the sum of Vouchers Payable and Discount columns against the sum of the distributive columns. Here it is best to treat the Purchase Discount column total as an item to be posted, and the Discount column in the cash book as a memo. As regards the income from purchase discount, the effect of entering the voucher net is to bring onto the books the purchase discount income as soon as the voucher is entered. Purchase discount is not usually looked upon as earned until payment of the bill is made and thus the right to the discount established. This method then necessitates at the close of the fiscal period an adjustment of the difference between the Discount columns in voucher register and cash book, in order to defer to the next period the discount not yet earned on all vouchers unpaid at the close of the period. This may be accomplished by the usual method of deferring income, or by the following entry, on the theory that it is better for Vouchers Payable to carry the gross amount of liability, at the _end_ of the period, at all events.

Purchase Discount $..... Vouchers Payable $.....

The entry must, of course, be reversed immediately at the opening of the new period—a procedure which makes this method of adjustment of doubtful value.

If there is any failure to take the discount, after the voucher has been entered net, it becomes necessary to make up and enter a supplementary voucher for the discount, with cross-reference between the original and the supplementary vouchers. The new voucher must be distributed to Sundry column as a charge to Purchase Discount. One of the few advantages of this method is that it makes possible reconciliation with the bank account by checking the canceled checks against the voucher register, which thus carries in its Vouchers Payable column the exact amount of the check and its entries are in the sequence of voucher numbers; whereas on the cash book voucher number sequence cannot be followed. Accordingly it is unnecessary to use treasurer’s numbers on the checks in order to secure sequence of numbers in the cash book.

The customary method, and one which usually proves most satisfactory, is to make up and enter the voucher for the gross amount, using the Discount column in the voucher register merely as a memo or not at all, posting the discounts, as earned, from the cash book and using a separate series of treasurer’s numbers when the checks are entered on the cash book.

Strict adherence to the theory of cash discount as a purchase department item would require making and entering the voucher net and distributing it net. The Discount column in the register might well be changed to a “Neglected Purchase Discounts” column into which would be distributed the supplementary voucher required when discounts are not taken. Under this theory, also, the voucher may be made up and entered gross, with the discount handled as a regular purchase discount item, and the net amount distributed to the other columns. The student should work out the manner of handling all the discount contingencies under this method.

Modifications of System

A regular purchase ledger is sometimes used with the voucher system. In such cases the voucher register becomes merely an analytic purchase journal and much of the advantage of numbering every transaction is lost. Accounts may also be set up merely as memos to indicate volume of business. The voucher index, as explained above, accomplishes this in a limited way.

A hybrid voucher system is sometimes met, a sort of half-hearted affair, which gives good results but does away with the essential idea of the voucher as being a receipted bill. Under it, a house voucher—so called because it never leaves the house—is made up and used as the basis of entry. The bill is paid by independent check, which when canceled is filed with the voucher. In all respects, except that the voucher is not sent with the check to be receipted, the system is operated as a regular voucher system. An advantage claimed is that in this way all information as to distribution of the charge or use of the purchased materials or services is kept strictly within the business itself. This is done at the sacrifice of securing a receipted bill.

Summary of Operation and Advantages

By way of summary, it may be stated that a fully efficient operation of the voucher system is comprised under the following routine:

1. A verification of invoices. 2. Making up and entering the vouchers. 3. Filing vouchers previous to payment. 4. Paying vouchers. 5. Filing paid vouchers. 6. Indexing vouchers.

Some of the advantages claimed for the voucher system are:

1. It gives a detailed analysis of all purchases. 2. It saves labor by doing away with the purchase ledger. 3. It secures an up-to-date entry of all liabilities. 4. It localizes responsibility by showing authority for the auditing, payment, and entry of the items. 5. It secures a receipted bill for all disbursements of cash.

The chief disadvantages are:

1. Clumsy provision for returns and allowances, partial payments on bills, and notes payable. 2. Inadequate showing of volume of business with each creditor. 3. The giving out of information about the business which should be kept private.

It should always be borne in mind that any satisfactory method of account-keeping must be adapted to individual conditions. If efficient results are expected, a business man should beware of ready-to-wear accounting systems. There are conditions in which the voucher system gives excellent results. There are also conditions to which it is entirely unadaptable and inadequate.

CHAPTER III

FACTORY COSTS

Difference between Factory and Financial Accounting

As was stated in Chapter II, the accounting records of a concern making its own product are much more complex than those of a concern which limits its activities to the buying and selling of stock-in-trade. A much larger mass of detailed information is needed for the proper conduct of the business. In this chapter it is purposed to study in a broad way the fundamental principles involved in factory accounting and to examine some of its distinctive problems. Factory accounting does not differ in the real fundamentals of account-keeping from any other kind of accounting. Its principles of debit and credit are the same; it employs the same or similar kinds of accounting records; and the same general use is made of the records, viz., to serve as a guide in the proper management and control of the business. Its distinctive features are seen in the application of certain principles to secure special information. To understand the problems peculiar to factory accounting, it will be necessary to consider the nature of this information.

Definitions of Terms

Three elements enter into the manufacture of a product. These are material, labor, and expense. The problems of factory accounting are therefore those connected with the accounting for the costs of material, labor, and expense. Some terms used in this connection will need explanation. A standard terminology for cost-keeping is becoming fairly well established. Direct and indirect costs, prime cost, factory burden, or overhead expenses, factory cost, full cost or cost to make and sell—these are some of the terms needing definition. Direct costs are those which can be allocated directly to a specific product. They are items which can be separated from all other cost items and applied solely to a particular product. Indirect costs are those which are shared in common by the various products and so must be distributed over them on some equitable basis. Direct costs are sometimes called prime costs. The cost elements which can almost invariably be applied directly to the product are material and labor. The sum of these two items constitute, therefore, the prime or first cost of the product. The other items of cost which are incurred _in the factory_ or with which the factory is chargeable are variously called factory expense, overhead, or burden. These indirect costs cannot be charged directly to any specific product, and so they are shared by the entire factory output.

The sum of prime cost plus factory expense constitutes factory cost, i.e., the entire cost of manufacture up to the point at which the product is turned over to the selling department for sale. This is sometimes called total manufacturing cost.

Full cost is the price at which the manufactured article can be made and sold. In other words, to the factory cost of the article must be added its equitable share of all the other costs of conducting the business and also a margin of profit in order to arrive at a selling price. These definitions indicate some of the purposes of cost-keeping. Other purposes are given below.

Special Purposes of Cost Records

To maintain adequate control over production, careful records as to consumption of material and labor must be kept, so that the cause of any marked fluctuations of the costs of the current period from those of former periods can be investigated. The determination of factory cost makes possible a comparison of the policy of manufacturing with that of buying the manufactured article on the open market. This sometimes shows that manufacture is being carried at a loss. Again, the fixing of a sale price on the article, which while covering all expenses, shall at the same time leave a margin of profit, is a prime essential in every business. To be of the greatest advantage and usefulness, cost records should not only determine factory cost but they should accumulate the data needed to _predetermine_ the selling price with accuracy.

Nature of Raw Materials and Supplies

Materials or raw materials constitute the crude commodities or semi-manufactured articles which are to be worked upon and fashioned into a new product. It is seldom that any factory takes its material in the raw form in which it comes from nature. The product of the mines goes through many degrees and stages of refinement and at each stage of the process some of it becomes the “raw material” for another class of industry. The term is therefore relative; that which is the finished output of one factory becomes the raw material of another factory, to be worked upon and given new forms.

Auxiliary material and supplies are also made use of. Thus, certain parts such as screws, bolts, hinges, casters, fastenings, trimmings, and the like, are incorporated into the finished product without change of form or the application of any labor thereto. These also constitute a part of the raw material of the factory, their value as finished product being due to place utility rather than form utility.

Supplies are to be distinguished from raw materials. This also is a relative term. In general, material which does not directly form a part of the finished product is carried under the head of supplies. Materials used in getting ready or seasoning the raw material, i.e., auxiliary material, such as paint, putty, etc., the quantity of which used on each piece of product cannot be measured with exactitude and must therefore be spread over the entire product—these and similar items constitute manufacturing supplies. They are usually treated as a part of factory expense rather than as belonging to prime cost.

There are also factory operating supplies. These comprise the materials used in the operation of the factory. Repairs material, brooms, oil, waste, packing, nails, fuel, etc., are examples of this kind of supplies. These, of course, are classed with factory expense, also.

The raw material which enters into _prime_ cost is thus seen to be only that which can be charged directly to the particular product. All other material is overhead or expense.

Accounting for Material Cost

The problem of applying the cost of the material directly to the job is largely a problem of systematizing which requires the careful oversight and accounting for all materials bought and used in manufacture. Two general methods are employed. Under the one, the old method of keeping record of all purchases and taking the inventory periodically to determine how much material must have been used in the processes of manufacture, is deemed sufficient. In a small factory making just one product—or a few simple products—where the conditions are such that the manager has an intimate knowledge of all processes and can exercise personal control over them, fairly satisfactory results may accrue under this method, though the amount and therefore the cost of the material consumed in the product can never be known accurately until the inventory has been taken.

The other method requires almost as accurate accounting for material as for cash. A stores room or department must be established and a stores ledger installed. As materials are purchased and come into stores, they are classified in whatever detail is desirable and charged to their respective class accounts kept in the stores ledger. As material is needed for manufacture it is drawn by properly authorized order on the stores-keeper. These orders are called “requisitions” and indicate the material needed and the job or product to which it is to be charged. The requisitions constitute the source of the credit entries to the various stores ledger accounts as well as the charges to the job or product. The balances on the stores ledger accounts thus show the amount of each class of material which should be on hand in the stores room.

This method of keeping track of materials is known as the perpetual inventory system. By its use, it is possible to know without the taking of a physical inventory how much material is being used in manufacture and the cost of it. In this way much better control is secured over materials than under the physical inventory method. In keeping track of material values, of course, inward freight,

cartage, handling and stores room cost must be loaded onto the invoice cost of the materials to arrive at the full cost at which they are issued for manufacture.

Direct and Indirect Labor

The second element of prime cost is labor. In factory accounting, labor is divided into two classes, direct and indirect. These are sometimes called productive and non-productive, terms doubtless carried over from the old economics which looked upon some labor as productive and some non-productive—necessary, it is true, but rather of the nature of a necessary evil. Direct labor is a direct cost as explained above. That is, it is the labor of the workmen who apply themselves directly to the manufactured product as distinguished from the labor of those employees who plan, lay out, and supervise the work of others. Direct labor can be definitely allocated to specific product or jobs, because it is applied directly to them. Indirect labor cannot usually be allocated to a definite product because it is applied to all the product, not being employed long enough or definitely enough on any specific product to justify keeping track of the time and charging it to specific product. Direct labor is a prime cost; indirect a factory expense. It is with direct labor that our present discussion is concerned.

The problem to be solved in accounting for labor is not the determination of the total cost of labor used, as is part of the problem of accounting for materials, but the distribution of that cost over the product. Determination of labor cost, except that accrued at any time, is a comparatively simple matter because the workmen have to be paid at regular intervals. Distribution of the labor cost over the product is more difficult. This necessitates keeping a record of the amount of time spent by each workman on specific product. In that way the labor costs can be figured quickly and distributed to the various products worked upon.

Time-Keeping Records

To keep track of the workman’s time spent on each unit of product, record must be kept by means of time cards, timekeepers, time clocks, or other similar device which will show the time at which work was commenced and the time at which it was finished or when the working force is transferred to other work. The time card is arranged with space for number or name of the jobs or products worked on and the time spent on each. Use of the hour or day rate of wages paid the workman gives the labor charge to each particular product worked upon. This time card, or its equivalent, may be kept by department foreman, a special timekeeper, or by the workman himself. At the end of the week or other period, these time cards are turned into the office and they serve as the basis for making up the past week’s pay-roll or as a check against the pay-roll where some other source for the make-up of the pay-roll is used.

Pay-Roll

The pay-roll is merely a list of the names or numbers, or both, of the workmen, showing the time employed during the past period, and the rate of wages. A column to carry total amount due each workman is provided, as well as in some cases a place for the signature of the workman’s name to acknowledge receipt of payment. Provision may be made for other information, also, such as distribution of the labor cost to the specific product, but this is not usual. When the time cards of the workmen are turned in, they are checked against foremen’s reports or sick notices. The total time spent by each workman multiplied by the rate of wages gives the amount earned by each man. From this may be deducted any claims, such as insurance, rent, store charges, hospital and sick benefit, giving the net amount due the workman.

Safeguarding the Pay-Roll

Since the pay-roll is such a frequent source of error and fraud, all possible safeguards, chiefly of an internal sort, should be made use of. Where possible, workmen should be employed through an employment department to which requests for men needed should be sent. Some form of card record should be kept for office files of all men taken on—and perhaps of all men interviewed. Additions of names to the pay-roll should not be allowed without authorization, and the payment of the men should not be made by the same clerks who make up the pay-roll. The pay-roll should be checked as to mathematical correctness and, where possible, as to the content of the roster, both before and after making payment. Too often has the total of the pay-roll been changed after its correctness has been proven but before it has been presented to the treasurer to provide the funds needed, the thief pocketing the difference between the amount needed for payment of labor and the raised amount of the pay-roll. Checking before and after payment will prevent this.

If payment is by check, the total amount of the pay-roll should be transferred by check to a special bank account on which the individual checks are drawn. If payment is in currency, this will be secured by check on the bank and the pay envelopes made up from it. Before drawing the currency, the individual amounts should be analyzed to determine the denominations of the coins and currency needed for filling each envelope.

Methods of Pay-Roll Payment. On each pay envelope should be marked the name and the amount. One pay-roll clerk should count out the amounts, the other clerk verifying them and filling the envelopes. A very ingenious pay-roll machine can be used for filling envelopes with the proper amount. The total amount of the pay-roll is placed in a coin rack operated by a keyboard. As the amounts of the individual envelopes are set up on the keyboard, the coin rack delivers the correct amount into a chute which carries it to the envelope. At the same time the amount delivered is listed, making it easy, in case of error, to locate the envelope containing the wrong amount. When the envelopes are delivered to the workmen, each man should identify himself in the presence of his foreman and give receipt for his pay. This is usually done by signing the pay-roll. The clerks making payment and the witnessing foremen should sign the pay-roll. Any unclaimed envelopes are returned to the treasurer to be held a certain length of time for claiming, after which time they may be diverted to other uses, though the liability for them must still be shown.

Distribution of Labor Charges

Distribution of the labor charges may be made in several ways. The precise method must depend largely on local conditions. In a small factory making only a few products, or where cost by departments is the desideratum, the voucher register may be provided with sufficient distributive columns to meet the requirements. At the time the pay-roll check is entered, it is distributed according to the labor cost in the various departments or on the various batches of product. This dispenses with a general pay-roll or labor account on the ledger. In a larger concern or one in which a more detailed distribution is desirable in order to secure definite and accurate costs on a diversified product, distribution on the face of the voucher register might not be feasible. Here, the pay-roll check will be run through the register as a charge to pay-roll. When the desired analysis is made in accordance with workmen's time cards or other sources of information, a general or cost journal entry is made, charging the proper accounts and crediting Pay-Roll. Or, and usually better, a "Pay-Roll Distribution Book" may be used. This book is a recapitulation of the time cards distribution sheets. Each time card must be analyzed according to jobs, product, or departments, and these distributions as summarized should as a matter of permanent record be entered in a recapitulation book. This, by being made a posting medium, becomes the pay-roll distribution book. Charges to the proper accounts are made from this book, offset by a credit of the total of the book to Pay-Roll account. Sometimes the pay-roll book itself carries distributive columns and can therefore be made to serve as a pay-roll distribution record.

Accrued Wages. Distribution of wages accrued at the end of the fiscal period is perhaps best made through the general journal, although it can without much difficulty be run through the distribution book by making two recapitulations of the last week or pay-roll period at the end of the fiscal period, the portion of the week belonging to the last fiscal period being summarized separately from the portion belonging to the next period. Both summaries, however, should be run through on the regular pay-roll voucher for that week's wages.

Expense

The third item or element which goes into the cost of manufacture is factory expense. Under this head are included all the costs of manufacture excepting the prime cost elements of materials and direct labor. Indirect labor, factory supplies, light, heat, power, repairs and maintenance to factory buildings and equipment, depreciation on factory buildings and equipment, rent, insurance, etc., constitute the main items under this category. These are the indirect costs of manufacture because, while just as necessary as the prime cost elements, it is impossible to allocate them directly to the product. How much of the cost of light, how much of repairs cost, how much of the cost of factory supplies, etc., shall be charged to each unit of several different kinds of product constitute a problem on the solution of which depends the whole structure of accurate costing. Accurate distribution of materials and labor costs may be complex, but presents no real difficulties. It requires little more than careful and painstaking work. On the other hand, to secure an equitable basis for the distribution of factory expenses, and one which is at the same time a workable basis, is in some cases well nigh impossible.

One common basis of distribution for all the factory expenses will not usually give satisfactory results. Each item of overhead must be considered separately and will often require a distinct basis of distribution. Thus, indirect labor is sometimes distributed over product on the basis of the cost of the direct labor item in the product, on the theory that the cost of supervision is a cost of

supervising the direct labor and so closely related and dependent on that cost. Under some conditions, the number of direct labor hours is used instead of the _cost_ of direct labor. Again, the time the product is worked on in a given _department_ is taken as the most equitable basis for distributing indirect labor costs. Power, where metered to a machine, may be charged to the product on the meter basis. Where not metered, it may be charged on the basis of the time the machine is operated. So, every item of expense must be analyzed and effort made to secure an equitable basis of distribution.

Summary of Manufacturing Cost

Each unit of product, therefore, as it comes from the factory must carry its burden of cost composed of materials, labor, and factory expense costs. The sum total of all of these costs for all products—the entire output of the factory—will be the record of manufacture on the general books, the detailed record being carried in subsidiary books. At the close of the fiscal period when the temporary proprietorship activities of the business must be summarized, an entirely distinct group or section will be devoted to the activities of the factory because these costs must be shown separately from the others. For this purpose, the first section of the profit and loss statement and account is treated as the “Manufacturing” section, and under it are summarized in two groups the prime cost elements of materials and direct labor and the factory expenses. The total of this manufacturing section gives the cost at which the manufactured product is charged to the sales department of the business, and there this item takes the place of the cost of purchases in a business which buys its stock-in-trade. A detailed explanation of the manufacturing section as a part of the profit and loss summary is given in Chapter XXVII. The principles of cost accounting cannot here be developed further than this mere statement of the ends sought.

CHAPTER IV

THE BALANCE SHEET

Business Methods under the Microscope

The balance sheet is occupying an increasingly large place in all affairs of business and even of state, because the state is taking cognizance of business as never before. All phases of commercial activity are under the microscope. In these war times the government is tapping every available source of revenue. Kinds of property, property values, profits, rates of profit on capital invested—all are under investigation and the publicity resulting therefrom should make for a better conduct of future business. All this is forcing home to the manufacturer and trader some very obvious but long disregarded principles of business conduct necessary to secure health and long life. And these timely lessons will be of even greater use in the struggle for world markets that is imminent. As an interested party to any condition of business, labor also is claiming the right to be heard. The public in its direct dependence on certain classes of corporations for many of its necessities and most of its conveniences is also interested in the proper conduct of those businesses. As a factor in this increasing interest and scrutiny over business enterprises, exercised both from the inside and from external sources, banks are exerting a large and beneficent influence. The extension of credit, both bank and commercial, is no longer done by haphazard rule-of-the-thumb methods as in days gone by. Every applicant for credit must prove his right to it, must show cause why he deserves it, must present evidence of financial condition and standing on the basis of which the banker, the money lender, or the seller will be justified in extending all or some portion of the credit asked.

The Reading of the Balance Sheet

Because, in these and many other ways, the balance sheet offers the readiest means of securing the necessary information, it becomes an increasingly prominent statement. Before a proper understanding of the balance sheet can be had, and therefore before it can serve the various purposes to which it can be adapted, certain principles governing its make-up, both as to form and content, should be established. A proper reading of the balance sheet cannot be made without a thorough grasp of these principles.

The knowledge necessary for this is broadly of two kinds, viz.: (1) a knowledge of accounts, their technique, construction, and meaning; and (2) a knowledge of the principles of valuation as applied to business enterprises. The latter is not a domain of knowledge pre-empted by the accountant nor limited exclusively to his use. It touches more or less intimately all related fields of business endeavor. That is why the modern accountant needs a broad training and something more than a cursory knowledge of business practices and conditions. He should have a close acquaintance with the fundamental currents of business life, its organization and finance, and its basis in law, if he hopes to measure up to present-day requirements.

Thus not only is the accountant interested in the form and content of the balance sheet, but a proper understanding of it is valuable and increasingly necessary to all business men. In this chapter and those which follow, it is purposed to study these two problems of form and content, first establishing the broad basic principles and then showing in detail how these apply to various conditions and particular data. This chapter will concern itself with the problem of the make-up of the balance sheet so far as it relates to form.

Definition

George Lisle[4] defines a balance sheet as “a concise statement compiled from the books of a concern which have been kept by double entry, showing on the one side all the liabilities and on the other side all the assets of the concern at a particular moment of time.” Another writer says, “It is a cross-section of the business at a given instant”; and another, it is a “screen picture of the financial position of a going business at a certain moment.” As indicated by the first definition, an attempt is sometimes made to limit the term balance sheet to a statement made up from a double-entry set of books. With equal propriety it may be applied to any statement, whether made up from single- or double-entry books, or from any formal records, or from no records at all, which shows the assets and liabilities of a concern and the difference between them, i.e., the balance, as the item of net worth.

[4] In “Accounting in Theory and Practice.”

To distinguish this latter statement from the balance sheet when used in the restricted sense above referred to, the title, “statement of assets and liabilities” is sometimes used but there seems little reason for the distinction. Here the terms will be used as synonyms. The balance sheet then is a statement of financial condition as distinguished from a statement showing the operations of the business, and it is true only for a given moment of time. Theoretically the wheels of business are stopped momentarily, all operations cease, and a summary of the assets and liabilities then existing with their balance shown as net worth constitutes at that moment the balance sheet—the financial statement.

Relation between Balance Sheet and Trial Balance

A balance sheet when made up from a double-entry set of books bears a close resemblance to the trial balance. The trial balance is simply a list of ledger balances. Due to practical considerations in making the record from day to day, the ledger seldom reflects the true condition of the business, as there is no distinct separation of assets, liabilities, expenses, and income. Some accounts take on a mixed character, making necessary the periodic separation of their elements. This separation is effected by the adjusting entries explained in Volume I. A trial balance of the ledger after the adjusting entries are made contains the data for both the financial statement and the operating statement. After the operating data, i.e., the income and expenses, have been summarized through the Profit and Loss account and its balance has been transferred to some vested proprietorship account, the records left on the books relate only to assets, liabilities, and vested proprietorship. A trial balance now taken—a post-closing trial balance—contains only balance sheet items and to all intents and purposes is a balance sheet. While, as we shall see, the form in which the data of the balance sheet are presented is a matter of serious importance, any showing of assets, liabilities, and net worth constitutes a balance sheet.

Form of Balance Sheet

A balance sheet is not an account, nor is it the statement of an account. It is simply a statement of assets, liabilities, and proprietorship, arranged in whatever form best suits the purpose. Where set up in parallel columns, it is frequently called the account form; when shown vertically on the page, assets followed by liabilities and the difference indicated as net worth, it is called the report form. A balance sheet therefore being only a statement cannot properly be said to have either a debit or a credit side. It is not a complete system for the record of the transactions of a business set up in debit and credit form for the sake of proof, although on its statement of fundamental equality may rest the whole scheme of debit and credit. While usually made up from a system of double-entry books and so often spoken of as the goal of record-keeping, it may be made up from sources entirely extraneous to the books.

Purpose and Uses

The purpose of the balance sheet is, as indicated, to show financial condition. It may be made also to show the amount of profit for the period by elaborating the information given in the net worth section. If there has been during the period neither a withdrawal of any funds nor an additional investment, a comparison of net worths as at the beginning and at the end of the period will bring out the increase or decrease in net worth and therefore establish the _amount_ of profit or loss, though telling little or nothing as to its

source. If there has been withdrawal or investment or both during the period, adjustment must be made on account of these before the amount of profit or loss for the period can be determined from the balance sheet. The balance sheet may thus be made to show profit, though that is an incidental rather than an essential purpose of the statement.

As a statement of financial condition the balance sheet should make possible the determination of several facts. It may be used as the basis for short-time credit. If so, its purpose then is to show facts as to solvency. It may be used as the basis for floating a bond issue. If so, other groups of data in addition to the solvency facts must be held under view. It may be used for determining the advisability of an investment in the business. If so, its data must be examined from still another angle. In all of these cases the balance sheet must set forth clearly the relationship of the interests of the various parties in the business. The assets of a corporation are listed usually so as to show the total properties to which all the parties may look for the satisfaction of their claims. Of the claimants there are first, then, those whose claims are redeemable within a short time. Failure to meet these claims may mean insolvency. There are those also whose claims are not necessarily of immediate urgency, though they may be. Inability to meet these claims may mean bankruptcy and dissolution. Finally, the owners themselves have a proprietor's right only to any residue of assets left after the claims of all outsiders have been satisfied or are capable of being satisfied. Thus the balance sheet may serve many purposes.

Types of Balance Sheet

As the balance sheet must serve, or can be made to serve, several definite purposes, the best way to accomplish the end in view must receive careful consideration. It is here that the question of form enters. The various problems in connection therewith will next be discussed.

As to types of form there are in the main two, the English and the Continental or American, both of them well standardized, although many variations from the types are found. The chief difference between the two types lies in the showing of assets on the right side and liabilities and capital on the left under the English form, and a reversal of the sides under the Continental form. So much useless controversy has been carried on with such a waste of effort and words over the relative merits of the two types, that a writer now scarcely dares venture into the subject. As a matter of historical interest and information to the student, an effort will be made to summarize briefly the two positions.

Origin of English Form of Balance Sheet

In the development of record-keeping a stage was passed through in which every account on the ledger was closed. Not only were the temporary proprietorship accounts cleared through the Profit and Loss account, but all the remaining asset, liability, and vested proprietorship accounts were in like manner closed into a Balance account opened on the ledger for this purpose. The Balance account, after transfer of the various accounts into it, became virtually a balance sheet and so was itself in balance. In this way the whole ledger was closed. The Balance account at this stage, so the controversialists maintain, represents, and was later adopted as, the Continental form of balance sheet. The ledger could not, of course, remain closed; it had to be reopened for the record-keeping of the next fiscal period. This was accomplished by credit entries to transfer the assets, and by debit entries to take out the liabilities and vested proprietorship. These reopening entries as appearing in the Balance account represent the English form of balance sheet.

This explanation of the origin of the two forms is ingenious and even plausible, although not synchronizing historically with the lapse of use of the Balance account. Others have attempted an explanation on purely logical grounds. These hold to the theory of the personality of accounts, which looks upon the business always as an entity distinct from its owners. Here, the English form of balance sheet is said to be the statement of account rendered by the business to its owners, whereas the Continental is the account given by the owners to the business. A. Lowes Dickinson,[5] in discussing the two forms, says: "The balance of argument would seem to favor the latter (English) on the theory that a balance sheet is intended to set forth the position of the owner of the property, who should therefore be credited with what he possesses and charged with what he owes."

[5] In "Accounting Practice and Procedure."

Quite opposed to this view is the position taken by an English authority, George Lisle,[6] He says: "Why ... the assets which are on the debit side (of the ledger)[7] and the liabilities which are on the credit side, as according to the principles of accounting they ought to be, should change places (in the balance sheet),[8] it is impossible to justify. The custom seems to have arisen through the influence of the forms given in Acts of Parliament, chiefly The Companies Act, 1862, which must have been prepared by those

unacquainted with the theory of accounts. The Profit and Loss account is taken from the ledger, and the sides are not transposed, and there is no logical reason why the sides in the balance sheet should be reversed.... The form of balance sheet in which the assets appear upon the left side is both theoretically the correct form and in practice is the most convenient form to use.... Prior to about the passing of The Companies Act, 1862, it was the form chiefly adopted in England, but is so no longer."

[6] In "Accounting in Theory and Practice."

[7] Material in parentheses is author's.

[8] Material in parentheses is author's.

R. H. Montgomery[9] proposes a psychological explanation. He says: "The only sound reason the author can think of for the custom is that a conservative Englishman looks for his liabilities first and then looks to see if he has enough assets to discharge, them ... that the average American looks for his assets first and subsequently glances at his liabilities in order to assure himself that his excess of assets is as much as he believes it to be." Regardless of the origin of the two types and their respective merits, a balance sheet is everywhere used to show assets, liabilities, and net worth, and less and less regard is being paid to debit and credit or left and right sides, technical form giving place to an elasticity in the method of showing adapted to accomplish definite purposes.

[9] In "Auditing, Theory and Practice."

Variation of English Form

A variation of the English form of balance sheet is seen in the make-up of the balance sheet for British public service companies. These companies are authorized by special act of Parliament to raise money for designated purposes. The act, therefore, requires as a part of the statement of financial condition the rendering of an accounting of the receipts from sale of stock and bonds. Accompanying the financial statement, or rather as a part of it, is the statement, "Receipts and Expenditures on Capital Account," comprising the fixed asset and liability sections of the ordinary balance sheet. Illogical as it may appear in view of the usual English practice, this account is _credited_ with the capital stock and bonds issued to establish the undertaking, and is _debited_ with the fixed assets in which the capital funds have been invested, the intent of the law being that the capital funds raised should be applied to purchase of fixed equipment with which to earn revenue and that all other expenditures should be made from revenue. If the fixed assets exceed at any time the fixed liabilities and capital, it means that the excess has been supplied out of revenue. If the reverse is true, it means that capital receipts are being used as working capital. Any balance is carried down to the second part of the financial statement known as "General Balance Sheet," in which arrangement of the two sides is made according to English custom. The act authorizing this double-account form of balance sheet allows the valuation of the fixed assets always at cost, on the theory that their maintenance in a state of constant good repair and efficient working condition constitutes a charge against revenue and hence that depreciation need not be considered.

It has been suggested that the double-account form of balance sheet, or rather the law on which it rests, has been responsible for the decisions in the cases of Lee v. Neuchatel Asphalte Co. and Verner v. The General and Commercial Investment Trust, Ltd., reference to which is made later in Chapter XXII, "Profits," and Chapter XXIV, "Dividends." Here the decisions rested on the distinction between fixed and circulating assets and declared in favor of the maintenance of the capital funds invested in circulating assets but not necessarily of those invested in fixed assets. The following illustrates the double-account form:

THE EAST AND WEST RAILWAY COMPANY RECEIPTS AND EXPENDITURES ON CAPITAL ACCOUNT
========== | Railroads, Franchises | Capital Stock: and Other | Common $200,000.00 Properties $410,000.00 | Preferred 75,000.00 Current Expenditures | Debenture 50,000.00 for Construction | Funded Debt: and | General Mortgage Equipment 65,000.00 | Bonds 150,000.00 Investments in Other | Equipment Trust Companies 50,000.00 | Bonds 100,000.00 Securities in Hands | of Trustee 15,000.00 | Balance carried to | General Balance | Sheet 35,000.00 | ---------- | ---------- $575,000.00 | $575,000.00 ========== | ==========

GENERAL BALANCE SHEET, DECEMBER 31, 1918
========== | Capital Account, | Securities $50,000.00 credit balance $35,000.00 | Prepaid Expenses 750.00 Special Betterment | Accrued Income 1,250.00 Fund 15,000.00 | Accounts Receivable 25,000.00 Accrued Expenses 1,500.00 | Materials and Supplies 10,000.00 Dividends Payable 17,500.00 | Accounts Payable 25,000.00 | Cash 7,000.00 ---------- | ---------- $94,000.00 | $94,000.00 ========== | ==========

It will be noted that the sides of the capital account follow the debit and credit order of the ledger, whereas the general balance sheet reverses that order—an inconsistency for which even the English do not attempt explanation.

Balance Sheet Titles

The title of the balance sheet is fairly well standardized. Other titles are sometimes met, such as Financial Statement; Statement of Assets and Liabilities; Statement of Resources and Liabilities; Statement of Assets, Liabilities, and Capital; Statement of Financial Condition; etc. The title “Balance Sheet” seems best. Though not so fully descriptive as some of the other titles, it is generally understood and has not the objection of inadequate descriptiveness and unwieldiness often raised against the other titles. There is a similar variation in the titles used for the three main groups of items shown in the balance sheet, viz., assets, liabilities, and net worth. Obviously, portions of some of the general titles cited apply here with equal appropriateness. In addition, we find in use or suggested as appropriate, Property and Assets, Active and Passive, Debit and Credit, Positive and Negative, Proprietorship, Capital and Surplus, Capital, etc. None of these suggested titles have met with favor in practice, but they have served the worthy purpose, perhaps, of providing fuel for academic controversy. The titles, Assets or Resources, Liabilities, and Net Worth or Capital, seem thoroughly established and seem to cover the need.

Grouping and Classification

In the matter of classification and arrangement of the items under these main groups there is room for greater diversity both in practice and in theory. The need and purpose of classification and arrangement is obvious. While any statement, list, or schedule which shows assets, liabilities, and net worth may properly be called a balance sheet, only by a careful grouping and formulation of the items can their mutual interrelations and proper dependence be shown. Not only does the bringing of similar items into groups put them in proper perspective, but the arrangement of the groups to show their relations to one another makes for a more intelligent interpretation of the balance sheet. The controlling principle underlying classification of the items into groups is, in the main, their relative degrees of liquidity. Sometimes other factors, such as emphasis, perspicacity, publicity, and so on, bring about groupings which differ somewhat from those based solely on degree of liquidity. Thus it may be desirable to call particular attention to, say, the permanent investments of a concern, to the condition of its sinking and other funds, to the amount of new construction and betterments for the current period, or to the values tied up in intangible assets. No hard and fast rule can therefore be followed; elasticity, flexibility to the desired purpose are working rules which must underlie any scheme of classification.

As to titles for the various groups, one finds many. The current assets are variously styled Quick, Floating, Liquid, Circulating. As a sub-group under Current or as a separate group we find Working and Trading assets. Other groups are Fixed or Capital, Investments, Sinking and Reserve Fund Assets, Deferred Charges to Operation, Deferred Assets, Deferred Debits, Suspense Debits, with similar titles for corresponding credit items, Contingent Liabilities—in short almost any title which seems best to fit the needs of the particular case. Some of these may need some explanation.

The distinction between current and working assets is a somewhat fine-drawn one, although well taken under certain circumstances. Where the two groups are used, current assets include the cash, receivables, and temporary investments, and the working assets group (or working and trading assets as it is sometimes captioned) includes the stock-in-trade (finished goods, goods in process, and raw materials), supplies of all sorts used in preparing the goods for sale or in making the sale, office supplies, working funds in the hands of branches and agents, and the like. The line of demarcation between the two groups is not always clearly drawn, some placing the stock-in-trade among the current assets, others putting finished stocks in the current group and process materials in the working group. There is apt to be an overlapping also between the working and the deferred charges groups, supplies of various sorts often being treated as deferred charges to operation. Capital assets are fixed assets—the plant and those assets in which the capital must first be invested before revenue can accrue. When the group of capital liabilities is shown it usually includes both the long-term obligations incurred for raising capital as well as the capital stock. This unfortunately does not recognize a distinct section for the net worth items.

Arrangement of Groups

The arrangement of the groups among themselves, while showing variations, offers few important matters for consideration. Here, also, the principle of degree of liquidity controls. The arrangement is sometimes from fixed to liquid but rather more frequently from liquid to fixed. If the chief interest in the balance sheet is as to the amounts of capital invested in properties and the growth of such investments, it is claimed that the fixed asset group should be shown first. This might be the case with railways, steel corporations,

and other large concerns wherein the ratio of the fixed assets to the current is large. In other concerns—and these constitute the larger number—chief interest centers in the current group. Here, the ability to pay dividends, to extend a sales market through carrying larger stocks of merchandise, to secure credit, are the items of chief moment. It is contended that in these cases, the order of the groups should be from current to fixed.

Whatever grouping is made for the assets, a similar arrangement of groups must be insisted upon for the liabilities; it is the placing in juxtaposition or the same relative positions of similar groups among the assets and liabilities which makes for an easily intelligent reading of the statement. After all, the order of the groups, as from fixed to current or vice versa, is of small importance in comparison with the similar arrangement of both assets and liabilities and with the surety of the proper content of each group. The thing to be sought is the arrangement which will facilitate comparison of similar groups. A rather serious objection to the “fixed to current” arrangement is that it almost invariably necessitates the separation of the net worth elements. Thus, capital stock and long-term bonds are grouped together at the top for comparison with the fixed assets; the remainder of the net worth—surplus and reserved profits—must be shown at the end. The group of all net worth items together compels a general scheme of logical grouping from current to fixed.

A difference as to order is also found in the placing of deferred charges to operation. Regardless of the scheme of general grouping, one frequently finds the deferred charges placed as the last group. This also seems illogical. Only items of prepaid operating expenses should be included in that group. Such prepayments, while made in the one period, are properly chargeable to the next. Their effect, therefore, is to bring about a saving of the cash and other current assets for other uses during the next period. They are thus nearly related to the current group and could without any serious violation of principle be included thereunder. For the sake of emphasis and a more open showing, they are best shown in a group by themselves immediately following the current assets.

The intangible assets, good-will, franchises, patents, etc., are usually included among the fixed assets. Where so shown they should be given unmistakable titles and are best set up at the end of the group so as not to be covered and lost among the other items. A suggested scheme of grouping which will make an intelligent showing for most purposes follows:

========== | _Assets_: | _Liabilities_: 1. Current Assets | 1. Current Liabilities 2. Deferred Charges to | 2. Deferred Income Operation | 3. Fixed Liabilities 3. Investment of Reserves | 4. Permanent Investments | _Net Worth_: 5. Fixed Assets | | 1. Capital Stock | 2. Reserves of Profits | 3. Surplus |

The content of these groups and any further explanations necessary are treated in the chapters which follow, where the detailed application of principles is discussed.

As stated above, the important desideratum is a like arrangement of groups to facilitate comparison and care to secure the proper content of each group. Within the group itself, while the arrangement of the items is not so important, the principle of degree of liquidity should govern here too. Whatever the order of general arrangement of the groups, the same order may well be observed for the items within the group.

Report and Account Forms

Something should be said with regard to the merits of the two methods of arranging the three main classes of items, i.e., assets, liabilities, and net worth, on the balance sheet. As previously stated, the method known as the report form makes a vertical showing of the classes, while the account form shows the items in parallel columns. The one lists the assets and from their total shows the subtraction of the total liabilities which are in a subjoined list. This difference, representing net worth, is explained in detail as to the portion represented by capital stock, surplus, etc. The account form method lists the assets in one column and the liabilities and net worth in a parallel column, bringing about a balancing of the two columns.

For the report form, it may be said that this method follows the reasoning of the average business man, particularly the man unacquainted with accounts, who subtracts his liabilities from his assets to find how much his present net worth is. The account form rests on the fundamental desire, deep-rooted in the system of double-entry bookkeeping, to show the two sides in balance. It may be looked upon as the technical form and therefore well adapted for publication purposes. It secures also a convenient juxtaposition of groups for purposes of comparison. The one may be regarded as non-technical, easily within the intelligent grasp of the layman; the other as technical and addressed to those trained to read that form of statement. As previously stated, any method of showing which fails to list separately the three distinct classes of assets, liabilities, and net worth is not usually to be justified; a

mixture of net worth and liabilities is bad. Omitting detail, the two following type forms meet the conditions laid down above:

REPORT FORM OF BALANCE SHEET _Assets_ Current Assets: Cash $..... Receivables ..... Stock-in-Trade ..... $..... -------- Deferred Charges to Operation: (See Schedules) ..... Investment of Reserves: Sinking and Other Funds Permanent Investments: (Held for purposes of control) ..... Fixed Assets: Plant $..... Equipment ..... Valuation Accounts

Nothing has been said thus far concerning the showing of valuation accounts on the balance sheet. Two different practices are met with. Sometimes such accounts are listed with the liabilities, and there is a sense in which they may be regarded as liabilities. Rather, however, they should be looked upon as credits to asset accounts, held temporarily in suspense until they can be definitely allocated to their assets. They are offsets to show the _appraised_ values of the various properties. As such, therefore, they are best shown as deductions from their corresponding assets with the appraised value full-extended. This applies to both the debit and the credit valuation accounts. A full discussion of these and other reserves is given in Chapter XXIII.

Statutory Requirements as to Frequency of Balance Sheets

Excepting in the case of corporations, there are few, if any, compulsory regulations governing the frequency of balance sheets. Some of our tax laws have brought about an increasing regularity with regard to the issuance of formal statements, both balance sheet and profit and loss. England, France, and Germany require a formal statement from corporations once a year. In this country, most states require some form of statement but oftentimes the requirement is so indefinite or so inadequately or half-heartedly enforced that the statement submitted is of little value. On the other hand, some classes of financial and public service corporations are required to present full and adequate reports periodically, at least once a year. In the case of national banks five reports are asked for; in the case of savings banks in some states two reports are required.

Condensation of Information in the Balance Sheet

The relation of the formal balance sheet to the post-closing trial balance needs further consideration. It has been stated that a post-closing trial balance is essentially a balance sheet. As the purpose of the latter is to present a bird’s-eye view of financial conditions, much of the detailed information shown in the post-closing trial balance must be condensed and consolidated with similar items, so that only totals are shown on the balance sheet. Just as the purpose of the ledger is by a process of analysis to secure detailed information for use in the current control of the business, so the balance sheet by losing sight of the detail and by setting forth the fundamental currents of business life and health, provides the data for the larger aspects of control. How far this process of condensation should be carried depends largely upon the use to which the balance sheet is to be put. A statement of financial condition to be issued to the public—stockholders and outsiders—can well omit data which would be required for internal use. Care must always be taken in condensed statements to avoid consolidation of detail in such a way as to render the statement misleading. The English Companies Act of 1862 provided that the “auditors’ report should state whether in their opinion the balance sheet was a ‘full and fair balance sheet’ containing the particulars required by the company’s Articles and ‘properly drawn up so as to exhibit a true and correct view of the company’s affairs.’” This represents the proper attitude for every accountant to assume in the making of statements. This is not meant to require the publication of information which is the private property of the business.

The phrase, “full and fair,” must be interpreted to mean sufficiently full, and only so much so that it will be fair to both parties. The company is entitled to withhold legitimate information the publication of which would be detrimental to it, and not to do so would be unfaithful to the proper guardianship and protection of its interests, and this in turn would bring about dissatisfaction with the management and oftentimes ill-feeling among the owners.

Use of Supporting Schedules

By means of supporting schedules, as illustrated and discussed briefly on pages 411 and 412 of Volume I, it is possible to carry condensation to almost any desired degree and still have available all necessary detail in the accompanying schedules. What items in the balance sheet should be supported by schedules and what should not, must be determined by the conditions peculiar to each case. Here again, the determination rests largely upon the use the statement is to serve. The informational content is therefore largely dependent upon the purpose for which the statement is drawn.

Balance sheets may serve any one of the following purposes:

1. Internal use by proprietor or manager. 2. Formal report to stockholders. 3. As a basis for application for credit. 4. For publication or report to regulating or supervising commissions. 5. For annual report to the state. 6. For advertising purposes to float new issues of bonds, preferred stock, etc.

When used for some of these purposes, oftentimes condensation is made a convenient method of bringing about a misrepresentation of true condition. Of course, no justification can be found for this.

Emphasis has already been placed on the necessity of choosing titles and captions which shall indicate clearly the nature and content of the transactions or data recorded thereunder. Statements of condition which are misleading, whether with intent or by chance, are to be condemned. As H. R. Hatfield[10] so well summarizes, the lack of clearness and consequent misunderstanding of the balance sheet are due in the main to three causes: (1) vagueness of terminology; (2) purposeful misrepresentation; and (3) the very nature of accounting itself which so largely rests on estimates rather than on facts of definite determination. Some of these troubles have their origin in the form of the balance sheet, the manner of showing the items; while the others inhere in its content. It is to a study of the content of the balance sheet from the standpoint of the statement of values, with the emphasis on quantitative analysis, that we now turn.

[10] In “Modern Accounting.”

CHAPTER V

GENERAL PRINCIPLES OF VALUATION

Content of the Balance Sheet

The problems of content and valuation strike at the very heart of the balance sheet. Form, framework, and method of presentation are important and their usefulness should not be discounted. Particularly is this seen to be true from the standpoint of availability of the information presented and facility in its interpretation; but the meat of the balance sheet is its content. In connection with this, two points demand consideration, viz.: (1) what items shall be admitted to a place in the balance sheet; and (2) on what basis shall they be admitted, this latter being the problem of valuation.

The first question can be answered without much trouble. All properties owned and all liabilities incurred must find a place in the balance sheet. The properties belonging to a business include both the tangibles and intangibles, rights and claims. Most of these have cost value, some may have been gifts. All the assets must, therefore, be listed. Similarly, the liabilities, all those things which represent debts owed by the business or established claims against it, must be given place in the balance sheet. Neither from the assets nor the liabilities must there be allowed omission. As stated in Chapter IV, as to content, the balance sheet must be “full and fair.” Some classes of items, known as _contingent_ assets and _contingent_ liabilities, will be discussed and their place determined as they are met. The net worth items, in whatever detail desirable, must also be included.

Valuations for Rate Regulation

The second problem as to the basis on which items shall be valued for the balance sheet is our chief problem. The general question of valuation may be viewed from so many points that definition of its meaning here is necessary. Principles that are

applicable to valuations for one purpose frequently cannot be made to serve another purpose. Because of the agitation in recent years relative thereto, when the problem of valuation is mentioned it is associated almost invariably with public service corporations. Most of the so-called valuation work has been done in connection with railroads, water companies, gas and light companies, etc. Here the issue of regulation is involved. Regulation of rates is price regulation and therefore regulation of profits. The purpose of valuation in connection with public utilities is the determination of the amount of investment on which rates must be so regulated as to secure a return based on fairness and equity to all parties.

Where such valuations have been made they have not proven entirely satisfactory and it is placing too great faith in human kind to expect the satisfaction of all parties with the results of any valuation. Where the properties involved have not been exceedingly complex and have been fairly well localized, results have seemed to justify the effort; but in the case of a large and complex plant covering widely separated areas and serving many and different communities, as is the situation with railroads, in the minds of many the results obtained in such instances are of doubtful value when compared with the effort and cost expended. Though much can be learned from such valuations, the principles underlying them differ at many points from those which must control in valuations as applied to commercial balance sheets. It is in connection with public service valuations that very valuable studies of the depreciation problem have been made.

Valuation for Sale and Purchase

Again, valuations and appraisals are often made in cases of prospective sale and purchase negotiations. While most of the determining principles are the same, not all apply to our problem of going concern valuation. Thus, the plant to be purchased may not be continued in its present use but must be adapted to other uses. Results secured towards controlling the market by means of this purchase may make the plant much more valuable than its physical worth. Elements of “going concern” and good-will call for valuation in the case of a purchase and sale transaction and are frequently not present in commercial balance sheet valuations. These last questions touch closely our problem and will receive careful consideration in their proper places.

Other Kinds of Valuations

There are several other kinds of valuations, all more or less closely related to commercial balance sheet valuations but differing from them in some respects because of their differing purposes and ends sought. The chief of these are: (1) valuations for purposes of fire loss adjustments; (2) valuations for purposes of liquidation to satisfy creditors and determine the owners’ equities, as in bankruptcy and voluntary dissolutions; and (3) valuations for purposes of taxation. In all of these cases, many points of similarity to, and of some differences from, our present problem are found. In the first and third kinds enumerated, there is marked similarity, but the problem in the case of the income tax is not so broad. In the second kind, the problem is entirely different, as values have to be determined on the basis of forced sale.

Going Concern Valuation

The kind of valuation to be treated here may be called “going concern” valuation. By that will be meant the values at which the various items shall appear in the balance sheet when viewed from the standpoint of a concern which expects to continue operations—a going concern as contrasted with one which is facing dissolution, reorganization, sale, or other eventuality. As stated above, the principles of going concern valuation are not distinct and separate, except in a few instances, from those governing the other types of valuation referred to. Oftentimes they are the same principles applied in the same way because the purpose is practically the same; again they are the same principles but applied differently in order to serve different purposes; and finally they are sometimes entirely distinct principles because the purpose to be served is entirely different.

It is not purposed in this treatment of valuation to set forth the points of variance and sameness with the other types; that is beyond the scope of the present volume. Endeavor will be made to set forth clearly underlying principles and their detailed application to the chief items met in the average balance sheet as viewed from the standpoint of a going concern. Elsewhere, notably in Chapter XXXV, some principles of another type of valuation will be discussed.

In any consideration of valuation, it is necessary to seek out the sources and kinds of value to determine in the one case its basis, and in the other to establish the type of value applicable to the given conditions. Value is not of spontaneous origin; it cannot be created out of nothing. Here it is not intended to search for causes of value or to inquire into the forces back of them. The author is content to leave that to the economist.

Kinds of Value

Various kinds of value are established facts of the world of business and by their sources, as the term is used here, is meant the information which vouches for or establishes the fact of value, rather than a search for the cause of it. Thus we find, among others, the following kinds of value:

1. Cost value 2. Market value 3. Sales price value 4. Reproduction cost value 5. Scrap, salvage, junk, or break-up value 6. Service value 7. Present or depreciated value 8. Tangible or physical value 9. Intangible value 10. Taxable value 11. Earning value or earnings-capitalized value 12. Liquidation or forced-sale value, etc.

It is to be understood that these various kinds are in no sense mutually exclusive and separate; they are met in the common vocabulary of men of affairs, are construed loosely in most cases, but have quite technical connotations in some places. Any of the terms employed here will, whenever necessary, be defined. Thus, in accounting, by cost value is usually meant full cost of a product or other asset in position ready for its intended use.

Source of Data as to Values

The sources of data as to values are several. Where double-entry books are kept, the original cost of the various assets can usually be secured from the books of account, barring errors of principle and omission in making the record. If not found there (as is often the case where single-entry books are kept), the original purchase invoice gives the chief item of cost, but does not usually show any inward-carrying or placement costs. Where there is a formally established market, this may give the information as to value when no book entries are available. Quoted prices in trade catalogues or lists as of the date of purchase, offer another means of procuring the information. Sometimes, even the memory must be relied upon.

Present values of properties purchased formerly may be determined on the basis of original cost adjusted to take cognizance of depreciation and, sometimes, of appreciation. This adjustment is made in the light of the best available experience. The amount of the adjustment is sometimes called an “experience figure.” Stated otherwise it is an _estimate_ made on the basis of past experience with some regard to future contingencies. This estimate may be made by some one within the organization—manager, owner, etc.—or by regular appraisal companies who specialize on this kind of work. Usually, however, the appraisal company bases its value on present cost less depreciation—a reproduction cost value.

Again, for some purposes the statement of earnings as giving the amount to be capitalized becomes the source of values. As has been seen, however, earnings themselves contain many elements which rest on estimated values. In almost all instances there is an element of speculation—an estimate—in the determination of values.

Cost Value the Usual Basis

The values which are, for the most part, shown in the commercial balance sheet are cost value or adjusted cost value. Occasionally, values which bear only an indirect relation to cost must be taken into account. The determination of cost value is sometimes a comparatively simple matter, as where the source is a purchase invoice, but more often it involves numerous other costs in addition to those shown by the purchase invoice, both definite and indefinite, i.e., estimates. It is in connection with the determination of cost that the proper segregation of the so-called capital and revenue charges is of vital importance. An effort will be made to formulate the distinction between them so as to give a working rule for their determination under most circumstances.

Definition of Capital and Revenue Expenditures

Capital expenditures may be defined as expenditures of funds or other assets on capital account. In accounting language, they may be said to be those expenditures which result in charges to some asset account. They may sometimes ultimately result in a charge to a liability account by the conversion of the asset to the decrease of the liability. Expenditures of capital may be made on account of expenses. This can occur only when revenues are insufficient to meet all expenses. Such expenditures of capital bring about an impairment of capital. As the term is generally used, however, capital expenditures have the meaning first given.

Revenue expenditures may be defined similarly as expenditures of funds or other assets on revenue account. That is, such expenditures must be booked as charges to expense accounts. They represent the expenses incurred in the earning of the revenue, and measure its cost. Just as the original capital fund, through its expenditure, must provide the plant and equipment with which to work, so the other expenditures necessary to prepare and market the product must provide the revenue out of which to

meet these expenditures and secure a margin of profit; else there is encroachment upon the original capital funds.

A few other terms need definition by way of differentiation from these. The term “capital receipts” is used to differentiate receipts of funds from the sale of capital stock or the sale of capital or fixed assets, from funds or other assets received from revenue or profits sources. Thus, upon the sale of any asset which was originally purchased out of capital, the receipts therefor must first be applied to take the place of the capital expended for the asset, and any balance not used for the first purpose is then a receipt of revenue.

The term “capital expense” is sometimes used to indicate the group of expenses incurred in providing the capital needs of the business. They are the financial management expenses as the term is used in Volume I. Opposed to capital expenses are the capital income or revenue items. These are the receipts or income from portions of the capital employed otherwise than in the purchase and sale of commodities; or the income which represents savings effected through the handling of the funds of the business as distinguished from income derived from the handling of stock-in-trade. They are _deductions_ from the financial management expenses.

Capital and revenue expenditures are thus easily differentiated on paper. It is in the application of the definition to situations as they develop in practice that difficulty is encountered. Some of these situations will be examined with the purpose of determining the application to them of the distinction between revenue and capital expenditure.

Organization Expenses

Upon the organization of a new enterprise the distinction between capital and revenue expenditures can usually be made without much difficulty. All costs incurred to put the concern in a position to earn revenue are properly treated as capital expenditures. Sufficient capital must be provided to put the undertaking on an earning basis, as otherwise it fails. These costs will include many items which upon their _second_ incurrence must be treated as expense charges because the revenue must provide for keeping the plant in a state of efficient repair. One group of capital expenditures, usually carried on the books under the title “Organization Expense,” is often treated as a revenue expenditure as soon as sufficient revenues have accumulated to care for them conveniently. This is discussed in detail in Chapter XVIII on intangible assets. It is sufficient to say here that upon their incurrence organization expenses constitute capital expenditures, for no other funds are available for the purpose.

Definition of Replacements, Renewals, Maintenance, etc.

Only after the concern becomes a revenue-producer is the chief difficulty encountered in determining the proper record as between capital and revenue. In all cases of new construction and additions to the existing plant or equipment, no question arises as to the legitimacy of such capital charges. But when replacement, renewal, or betterment of existing properties take place, difficulty is met in determining the portion chargeable to the asset and the portion to be charged against revenue. The dividing line between renewals and repairs, maintenance, and up-keep is a closely drawn one, and usually an arbitrary working rule suitable to conditions must be adopted by each concern. R. P. Bolton[11] gives for some of these terms very suggestive definitions which the author quotes in full:

[11] In “Power for Profit.”

“Maintenance is a process of continuous attention to, and supply of, operating necessaries, including solicitous observation of the condition of the object cared for, corresponding to the protecting shelter, clothing and food supplies to living beings, in order to maintain their functions in operating condition. It includes supplies which form part of the food of the appliance. Part of the labor in attendance on machinery is involved in this element of its care.

“Up-keep is a course of partial recreation, involving the expenditure of time and money in anticipating causes of decay, of failure, or of possible injury to the object under care, corresponding to hygienic and recreative methods, often involving considerable expenditures without apparent direct results, which are or should be followed in safeguarding the general health and strength of human beings. Thus, welfare and recreation of employees is a justifiable expense of an industry. It is part of the cost of the human machine.

“Repair is the course of partial reconstruction, replacement, or renewal of worn or of injured portions, after the necessity therefor becomes apparent, and, unless brought about by accident, the need for the process is brought about by the failure or inability of maintenance, and also of up-keep, wholly to arrest the progress of decay by age or continued use. Provisions to preclude accident or to cover the cost of its results are part of the cost of repair. Health insurance of employees is a repair cost paid in advance.”

While these definitions were not intended for accounting purposes and are not fully applicable thereto, they call attention to the basic ideas of the terms. The distinctions are in some cases too finely drawn. For accounting purposes the title “maintenance and repairs” usually gives sufficiently detailed information. Repairs is a part of the process of maintenance, as is also renewals. Maintenance, from an accounting standpoint, may be defined as “the act of keeping a property in condition to perform adequately and efficiently the service for which it is used.” A. Lowes Dickinson[12] defines repairs and renewals as follows:

[12] In “Accounting Practice and Procedure.”

“Repairs. This should include all current expenditures recurring from day to day and from month to month on the general up-keep of the existing property without the renewal of any substantial part thereof, and generally all periodic repairs which are necessarily undertaken within, say, one year.

“(This caption will, of course, include certain renewals of small parts, etc., such as would be necessary to continue the useful life of any unit of building, plant, or machinery over the estimated period of its life.)

“Renewals. This should include all expenditures incurred in renewing, in whole or in part, any unit of building, plant or machinery, which tend to extend its useful life beyond the average term. These expenditures would in general be those which would only occur at long intervals of two or three years, and whose effect would last for a number of years afterwards.”

As distinguished from renewals, a replacement may be defined as “the act of replacing a plant unit which is going out of service, with a _substitute_ which may be either identical with the unit replaced or different from it.” In accounting terminology the terms “renewals” and “replacements” are for the most part used synonymously and will be so used here.

Treatment of Renewal of Parts

In the maintenance of a property in efficient condition, repairs and renewals are constantly taking place. When for an old part or plant unit a new one is substituted, the question of betterment immediately arises. If an old machine with book value of $500 is replaced by one costing $750, the excess of $250 is classed as a betterment and is properly a charge to capital. A renewal of machine _parts_ cannot be handled so easily. The parts of a machine are subject to diminution in value due to wear, tear, and obsolescence, along with the machine as a whole. The machine was purchased for a lump sum. What portion of the cost is applicable to each individual part is difficult to determine and must usually rest on estimate or guess. Similarly, the book value, i.e., the present depreciated value of a part, is not accurately known. Accordingly, the amount of betterment, if any, in the replacing of an old part by a new part is difficult to determine. It is here that working rules must be adopted for each concern.

Thus, it has been suggested that only when the renewal involves an expenditure of $5 or more should there be any attempt to determine the amount of betterment, every expenditure under $5 to be charged to expense. In an establishment of any size this is altogether too small an amount. The Chicago Traction System through its board of supervising engineers has established $200 as the minimum charge to capital or renewals. All transactions involving even a true betterment, if the amount is less than $200, are to be recorded as maintenance charges. As a means of simplifying the accounting, a working rule, with a minimum capital charge adapted to the conditions of each concern, serves a practical and useful purpose.

Treatment of Cost-Cutting Changes

Other kinds of expenditures which cause trouble as to their proper place of record are those incurred for the purpose of facilitating the handling of the work. They may result in an increase of capacity to earn revenue through a speeding up of production, or the result may be simply a lessening of the expense of turning out the various units of product. A test frequently applied in such cases is that of increased earning capacity. It is argued that even though nothing tangible which did not exist before has been added to the plant, there has been a rearrangement of the factors of production with a resulting co-ordination of effort, and this has increased the capacity of the plant, thus making it more valuable. Inasmuch as this value is measured by earnings, the cost incurred in securing the increase is a very proper and legitimate charge to capital. Against this argument, it may be said that plant or structural changes are always made to improve operation. To make increased earning capacity the sole test is virtually to capitalize all expenditures of this kind—a policy which would soon lead to an unconscionable inflation of assets. Only by a policy of very liberal depreciation can such values if capitalized be kept within reasonable bounds. The impropriety of charging such expenditures to the current profit and loss account is generally acknowledged.
